1. Identification of American-made Iron, Steel, and Manufactured Goods: Consistent with the terms of the Purchaser's bid solicitation and provisions of Section 436 of the Consolidated Appropriations Act of 2014, the Proposer certifies that this Bid Proposal reflects the Proposer's best, good faith effort to identify domestic sources of iron, steel, and manufactured goods for every component contained in the bid solicitation where such American-made components are available on the schedule and consistent with deadlines prescribed in or required by the bid solicitation.

2. Verification of U.S. Production: The Proposer certifies that all components contained in the bid solicitation that are American-made have been so identified, and if this bid is accepted, the Bidder agrees that it will provide reasonable, sufficient, and timely verification to the Purchaser of the U.S. production of each component so identified.

3. Documentation Regarding Non-American-made Iron, Steel, or Manufactured Goods: The Proposer certifies that for any component or components that are not American-made and are so identified in this Bid Proposal, the Proposer has included in or attached to this Bid Proposal one or both of the following, as applicable:

    a. Identification of and citation to a categorical waiver published by the U.S. Environmental protection Agency in the Federal Register that is applicable to such component or components, and an analysis that supports its applicability to the component or components;

    b. Verifiable documentation sufficient to the Purchaser, as required in the bid solicitation or otherwise, that the Proposer has sought to secure American-made components but has determined that such components are not available on the schedule and consistent with the deadlines prescribed in the bid solicitation, with assurance adequate for the Proposer under the applicable conditions stated in the bid solicitation or otherwise.

- Information and Detailed Justification Regarding Non-American-made Iron, Steel, or Manufactured Goods: The Proposer certifies that for any such component or components that are not so available, the Proposer has also provided in or attached to this bid information, including but not limited to the verifiable documentation and a full description of the bidder's effort to secure any such American-made component or components, that the Bidder believes are sufficient to provide and as far as possible constitute the detailed justification required for a waiver under section 1605 with respect to such component or components. EXHIBIT C

GUARANTEED MAXIMUM PRICE, COST OF WORK AND FEES

Pleasant Grove Wastewater Treatment Plant Energy Recovery Project

EXHIBIT C

GUARANTEED MAXIMUM PRICE, COST OF WORK AND FEE

Pleasant Grove Wastewater Treatment Plant Energy Recovery Project

A. GUARANTEED MAXIMUM PRICE: The **Guaranteed Maximum Price ("GMP")** as of the date of execution of this Agreement is twenty-three million, three hundred forty-nine thousand, seven hundred twenty-nine dollars ($23,349,729.00). Subject to the provisions of this Agreement, the costs and expenses which the Contractor may include in the Cost of Work for purposes of determining that aspect of the Contractor's compensation are as set forth in this Exhibit C. The Contractor's total compensation, including Fee and allowable mark-ups, shall not exceed the GMP. The GMP may be adjusted by Change Order in accordance with this Agreement.

Included in the GMP is the following total amount for worker protection pursuant to California Labor Code Section 6707:

$ 10,000

B. ALLOWANCES: Allowances and Allowance Amounts are listed in Exhibit D.

C. COST OF THE WORK: The term "Cost of Work" means the sum of all costs necessarily incurred and paid by the Contractor for labor, materials, equipment, subcontractors, special services, bonds, liability, workers' compensation and errors and omissions insurance, direct job overhead expenses, taxes and other necessary expenses incurred in the performance of the Work, that do not exceed the GMP. The following are categories of cost and expense to be paid by City to Contractor as Cost of the Work:

1. **Hourly Field Labor:** The cost of all labor employed by Contractor in performing the Work will be calculated at the Initial Hourly Field Labor Rates set forth below. Those rates include wages, fringe benefits, government mandated payments (workers compensation insurance and SSI), travel and subsistence.

   The Hourly Field Labor Rates will be adjusted during the Project whenever the prevailing wage rate determined by the Department of Industrial Relations for a worker classification changes (Note that this does not apply to any changes to labor rates required to be paid per the Davis Bacon wage determination) or in accordance with an Industry Master Labor Agreement, if the Contractor is signatory to any such agreement. All changes to the prevailing wage rates must be submitted by the Contractor and approved by the City.

   For labor not covered by a rate set forth below, the cost of labor is defined as follows:

   The cost of hourly field craft labor for workers (including forepersons when authorized by the Construction Manager) used in actual and direct performance of the Work by the Contractor will be the sum of the following:

   - The actual wages paid plus any employer payments to, or on behalf of workers for fringe benefits including health and welfare, pension, vacation and similar purposes.
   - All payments imposed by State and Federal Laws including, but not limited to, workers' compensation insurance, and social security payments. The rates used for workers' compensation insurance shall be actual rates paid by the Contractor for each specific craft and broken down by wage rate if applicable to that craft.

Actual General Liability insurance burden, if it is applied to Contractor's payroll. Contractor shall provide adequate backup information to Construction Manager to verify this burden rate is indicative of the actual rates paid by the Contractor as a percent of labor.

Except as otherwise may be agreed to, in writing by the City, the actual wages and benefits paid for manual classifications of Contractor's on-site workers will not, in the aggregate, be less than the current applicable wage for each classification as established by the greater of the two wage rates between the State of California Director of Industrial Relations and the Davis Bacon Wage Determination (APPENDIX A-2 of the Request for Bid Proposal).

Specifically prohibited from the labor costs are other payroll burden factors such as small tools (as defined in Construction Equipment below), bonuses of any kind and safety incentives.

Contractor shall include the actual travel and/or subsistence costs, if any, as a separate line item under the labor cost category when submitting progress billings to the City. Except as otherwise may be agreed to in writing by the City, the actual travel and/or subsistence costs will not be more than established in an applicable Master Labor Agreement or the State of California Director of Industrial Relations.

2. **On-Site Management and Administrative Labor:** Wages and Salaries of Contractor's management and administrative personnel assigned to this Project to directly manage and administer the Work on-site are included in the table below. These positions may include a Principal-in-Charge or Project Director, On-site Project Manager, On-site Project Engineer, On-site Field Engineer, On-site Superintendents listed by trade or title, General Foreman, On-site Office Manager, Yardman/Delivery Driver and On-site Administrative Assistant. These positions will be paid in accordance with the following table for entire duration of the Project and include all labor burden, overhead and profit mark-ups. The Principal-in-Charge or Project Director can only charge for hours worked at the Site for this Project and can also charge for attendance of on-site Project Meetings. Any off-site Principal-in-Charge time spent on this Project shall be included in the Contractor's Fee Schedule for the Project under the Contractor's Fee subsection below.

On-Site Management & Administrative Positions Hourly Rate Table

On-Site Management & Administrative Position	Hourly Rate
Principal-in-Charge	$ 125.00
Project Manager	$ 115.00
Assistant Project Manager	$ 105.00
Project Engineer	$ 75.00
Administrative Assistant	$ 40.00

Contractor is allowed to charge up to a maximum of 50 hours per week to the City for each full-time assigned management and administrative personnel even if an employee works more than 50 hours in a week (this maximum hour limit is for employee's total hours for both Pleasant Grove Wastewater Treatment Plant projects). The Contractor can only charge for supervisory management and administrative hours if they also pay those same hours to the employee that worked up to 50 hours in any given week. The Contractor is not allowed to charge for any supervisory management and administrative personnel hours not paid to any employee.

Other company personnel such as Corporate Officers, Division/Area Managers, or Operations Managers (unless either are designated as the Principle-in-Charge), Quality Control Managers, Safety Officers, Project Schedulers, Project Coordinators, Estimators,

Business Supervisors, Human Resources and Accountants are not allowed to charge any hours to the Project. The anticipated cost of such personnel shall be included in the Contractor's Fee Mark-up Schedule for the Project under the Contractor's Fee Mark-up subsection below.

3. **Materials:** The cost of all materials, including all factory testing, freight and delivery costs of materials, used in performing the Work will be the cost to the Contractor from the supplier thereof. All discounts for early payment shall accrue to the Contractor unless the City's payment to Contractor is paid to Contractor before discount payment is due in which case discount savings will be fully credited to City on next progress billing. All rebates and all returns from the sale of surplus materials shall be credited to the Cost of the Work.

4. **Construction Equipment:** The initial Contractor Owned Equipment Rates approved for billing to the City are found at the end of this exhibit. All changes to these Contractor Owned Equipment Rates must be submitted by the Contractor and approved by the City prior to billing City for Work performed. Approved changes to equipment rates is not an allowable increase in the GMP. The rates found in this table for equipment owned by the Contractor will, in all cases, be understood to cover all fuel, supplies, repairs, maintenance, insurance, ownership, and incidental costs and no further allowances will be made for those items, unless specifically approved in writing by the City. Equipment owned by Contractor will only be paid for the actual time equipment is used in performing Work and will be rounded to the closest full hour if paid by an hourly rate. Compensation for idle time of equipment through delays caused by the City will be made consistent with Section 8-1.09, Right of Way Delays, of the Caltrans Standard Specifications, provided, however, that the Contractor Owned Equipment Rates set forth below will apply.

   Equipment not owned by Contractor which is rented by Contractor and used in performing Work will be paid by City based on actual invoiced cost to Contractor, plus actual fuel/lube costs, provided the rental rate is not in excess of rental rates established by distributors or equipment rental companies in the local area. City-operated equipment will also be paid by City based on actual invoiced cost to Contractor provided the City does not deem any charges excessive. All transportation costs to move equipment on and off the Work will be paid by City up to a maximum of four (4) hours total travel time each way.

   Equipment with a value less than $500.00: The Contractor will be paid an amount of three percent (3.0%) of total hourly field labor costs as defined above to cover the cost of small tools and safety supplies for Work directly performed at the Site.

5. **Subcontractors and SubTier Subcontractors:** The Contractor will be paid for all Work performed by Subcontractor at the actual invoiced amount. Should a Subcontractor be required to perform extra work caused by a contract change order, the Subcontractor will be allowed a mark-up as provided for in Section 01260, CONTRACT MODIFICATIONS.

6. **Special Services:** Special work or services are defined as that work not included in this Agreement and characterized by extraordinary complexity, sophistication, or innovation or a combination of the foregoing attributes which are unique to the construction industry. These special services may include such services as registered land surveyor, licensed geotechnical engineer, licensed structural engineer, special testing or laboratory work. The special services may also include reasonable attorney's fees incurred in connection with preparation or negotiation of this Agreement with the City and subcontracts for the Work. The Contractor will be paid for special services in accordance with Article 12, PAYMENT AND COMPLETION, and based on actual invoiced cost, provided the City does not determine any special services costs to be excessive.

EXHIBIT C-3

GMP, COST OF WORK AND FEE

7. **Bonds and Insurance:** The Contractor will be paid the actual cost for the required bonds, as well as the cost of all insurance costs required for the Work (such costs are deemed a Cost of Work and are therefore contained within the GMP).

8. **Direct Job Overhead Expenses:** The Contractor will be paid for the actual cost of job overhead expenses which may include such expenses as office trailers, storage vans, temporary fencing/security, toilets, dumpsters, waste removal, water, utility power, jobsite landline telephone costs, jobsite internet provider costs, reasonable room and board subsistence for employees who live farther than 40 miles from the Site or as required by California prevailing wage laws, copy machine, water cooler and any office furniture required for the Work needs, and as required in the Specifications, including mobilization and demobilization of same. There will be no warranty reserve.

9. **Taxes:** The Contractor acknowledges it will be liable for all sales, use, gross receipts or other taxes, tariffs or duties related to the Work and that these taxes and tariffs are included in the GMP. All invoices to City will include the applicable taxes and tariffs that are the Contractor's responsibility and will not be shown as a separate line item on the Contractor's invoice.

10. **Preconstruction Services:** The Cost of Work will include all Design Assist Services including preplanning and preconstruction service costs incurred by Contractor prior to beginning of construction, and other Design Assist Services required throughout the construction period.

11. **Builder's Risk Policy Deductible**: The Contractor will be paid up to a maximum amount equal to the Builder's Risk Policy Deductible amount (not to exceed $100,000), for construction costs sustained by the Contractor as a result of a loss covered by the Contractor's Builder's Risk Policy and approved for coverage compensation by the Builder's Risk insurance carrier. The Contractor will not be paid for any Builder's Risk losses that resulted from the negligence of Contractor, any subcontractor, or anyone directly or indirectly employed by any of them or for whose acts any of them may be liable.

D. ITEMS NOT INCLUDED IN THE COST OF WORK:

1. Salaries and other compensation of Contractor's personnel stationed at Contractor's principal office or offices other than the Site, except as specifically provided above.

2. Expenses of Contractor's principal office and offices, other than the Site office.

3. Contractor's General Overhead and Expenses, except as specifically provided for in the Contract Documents.

4. The capital expenses of Contractor, including interest on capital employed for the Work and charges to Contractor for delinquent payments.

5. Hours in excess of 50 hours per week for each full-time assigned management and administrative personnel even if a management or administrative employee works more than 50 hours in a week.

6. Costs due to correction of Defective Work, disposal of materials or equipment wrongfully supplied, and making good any damage to property.

7. Costs that would cause the GMP to be exceeded.

8. Any costs incurred after City's Final Acceptance of the Project.

E. CONTRACTOR's MARK-UP FEES: The Contractor's mark-up fees for general overhead and profit shall be paid by the City in accordance with the table below.

Contractor's Fee Mark-up Schedule for the Project

Item d.1	Hourly Field Labor	23.0 %

GMP, COST OF WORK AND FEE

EXHIBIT D

ALLOWANCES AND ALLOWANCE AMOUNTS

Pleasant Grove Wastewater Treatment Plant Energy Recovery Project

Not applicable to this Agreement

EXHIBIT D

ALLOWANCES AND ALLOWANCE AMOUNTS

Pleasant Grove Wastewater Treatment Plant Energy Recovery Project

The following cost allowances and allowance amounts are included in the GMP as part of the Agreement:

Item #	Allowance Description	Allowance Amount
1		
2		
3		
4		
5		
6.		

DUTIES OF CONTRACTOR

A. Plan allowance Work collaboratively with the Construction Manager and City's Representative to control allowance costs and avoid impacts to the Progress Schedule.

B. Advise Construction Manager at least fifteen (15) days in advance of the need to purchase materials to avoid impacts to Progress Schedule.

C. Obtain competitive proposals from material suppliers, including:
   1. Quantity.
   2. Complete description of product and services provided under allowance.
   3. Unit cost.
   4. Total amount of purchase.
   5. Taxes and delivery charges.

D. On notification of selection, enter into purchase agreement with designated supplier.

E. Arrange for delivery and unloading.

F. Install products in accordance with Contract Documents.

G. Maintain accurate cost records, separate from the cost categories for the balance of the Work, which depict the total cost incurred for each allowance item.

H. Monitor each allowance item total costs to date and immediately report to the Construction Manager should the total cost to date reach 80% of the total allowance amount of any allowance item amount shown in above table. Should the total cost of any allowance item reach 80% of the total allowance amount budgeted, the Contractor shall quantify and forecast the cost to complete the remaining known allowance item tasks and submit this forecasted quantity and completion cost to the Construction Manager.

DUTIES OF CONSTRUCTION MANAGER

A. Consult with Contractor and City in consideration of equipment or material and suppliers.

B. Provide Contractor with all required product, technical or design related information as it pertains to the allowance items.

C. Make equipment, supplier or system selection and request proposal from Contractor for these items covered by each allowance.

D. Notify Contractor of final equipment, supplier or system selection to allow Contractor to begin submittal and procurement.

E. Review cost to date information submitted by the Contractor and prepare Change Orders as required for City approval.

ADJUSTMENT OF COSTS

A. The Contractor shall not exceed the allowance amounts shown in above table without the written approval of the City. Should the Contractor exceed the allowance amounts without the written approval of the City, the Contractor will be responsible for all costs greater than the allowance amounts shown in above table.

B. Contractor will be paid the actual total cost of each allowance item as a Cost of the Work. When actual total cost is more or less than amount of allowance, the GMP will be adjusted by Change Order.

COMPLETION TIMES AND LIQUIDATED DAMAGES

Pleasant Grove Wastewater Treatment Plant Energy Recover Project

EXHIBIT F

COMPLETION TIMES AND LIQUIDATED DAMAGES

Pleasant Grove Wastewater Treatment Plant Energy Recovery Project

Times Allowed for Completion

In accordance with the provisions of Article 9.2, **Contract Time**, the following milestone completions, completion periods, substantial completion and final completion contract times shall be completed within the number of consecutive calendar days from the date established in the Notice to Proceed for the commencement of Contract Time:

Contractual Completion Event	Completion Time (# of calendar days from Notice to Proceed date)
Substantial Completion Milestone 2: Natural Gas Line for Boiler Service	360
Substantial Completion Milestone 3: Potable Water, Utility Water, and Sanitary Sewer Yard Piping	390
Substantial Completion Milestone 4: Roadway Connection	420
Substantial Completion Milestone 5: Vehicle Fueling Facility	540
Substantial Completion Milestone 6: Digester Gas Availability	700
Substantial Completion Milestone 7: All Work	790
Milestone 8: Final Completion of all Work	820

The requirements for Substantial Completion are set forth in Article 12.12 of the Agreement. See Section 01 12 16 – WORK SEQUENCE for a complete listing and description of the Project milestones.

Damages for Delays

In accordance with the provisions of Article 9.5, **Liquidated Damages**, for the period of time that any portion of the Work remains unfinished after the time fixed in above **Times Allowed for Completion**, as modified by extensions of time granted by the Owner, it is understood and agreed by the Contractor and the Owner that the Contractor shall pay the Owner the liquidated damages listed below.

Contractual Completion Event	Daily Liquidated Damages
Substantial Completion Milestone 2: Natural Gas Line for Boiler Service	$2,500.00
Substantial Completion Milestone 3: Potable Water, Utility Water, and Sanitary Sewer Yard Piping	$1,000.00
Substantial Completion Milestone 4: Roadway Connection	$1,000.00
Substantial Completion Milestone 5: Vehicle Fueling Facility	$1,000.00
Substantial Completion Milestone 6: Digester Gas Availability	$2,00.00

Contractual Completion Event	Daily Liquidated Damages
Substantial Completion Milestone 7: All Work	$3,500.00
Milestone 8: Final Completion of all Work	$1,600.00

Weather Days

In accordance with the provisions of Article 9.4.2.C, Weather Delays, an allowance of twenty (20) working days of weather caused delay have been included in the time allowed for completion. This allowance represents a reasonable assessment of anticipated lost working days based on historical weather patterns. These weather days shall be included in the Contractor's schedule as specified in Section 01 32 16 - 1.08, PROGRESS SCHEDULES AND REPORTS.

EXHIBIT G

FAITHFUL PERFORMANCE BOND

Pleasant Grove Wastewater Treatment Plant Energy Recovery Project

Bond No. 070210386
Premium $ 95,267.00

PERFORMANCE BOND

This Performance Bond ("Performance Bond"), dated October 2, 2019, is in the penal sum of Twenty Three Million, Three Hundred Forty Nine Thousand, Seven Hundred Twenty Nine Dollars and 00/100 Dollars ($ 23,349,729.00), which is an amount not less than one hundred percent (100%) of the Total Contract Price, and is entered into by and between the undersigned W.M. Lyles Co. ("Principal" or "Contractor") and the undersigned Liberty Mutual Insurance Company ("Surety") to ensure the Principal's faithful performance of the Agreement for the Design-Assist and Construction of the Pleasant Grove Wastewater Treatment Plant Energy Recovery Project ("Design Assist Contract"). This Performance Bond consists of this page and the following Performance Bond Terms and Conditions, Paragraphs 1 through 10. Any singular reference to the Principal, the Surety, the City of Roseville, California ("City") or other party shall be considered plural where applicable.

BOND TERMS AND CONDITIONS

1. The Principal and the Surety, jointly and severally, bind themselves, their heirs, executors, administrators, successors and assigns to the City for the complete and proper performance of the Design Assist Contract, which is incorporated herein by reference.

2. If the Principal completely and properly performs all of its obligations under the Design Assist Contract, the Surety and the Principal shall have no further obligation under this Performance Bond, except as provided below.

3. If there is no City Default, the Surety's obligations under this Performance Bond shall only arise in accordance with the provisions of the Design Assist Contract. Similarly, any obligations to be performed by Surety are detailed in the Design Assist Contract.

4. If the Surety does not proceed as provided in the Design Assist Contract, then the Surety shall be deemed to be in default on this Performance Bond ten (10) calendar days after receipt of an additional written notice from City to the Surety demanding that the Surety perform its obligations under this Performance Bond. At all times the City shall be entitled to enforce any remedy available to the City at law or under the Design Assist Contract including, without limitation, and by way of example only, rights to perform work, protect work, mitigate damages, or coordinate work with other consultants or contractors at Surety's sole expense.

5. The Surety's monetary obligation under this Performance Bond is limited by the amount of this Performance Bond. Subject to these limits, the Surety's obligations under this

Bond are commensurate with the obligations of the Contractor under the Design Assist Contract. The Surety's obligations shall include, but are not limited to:

5.1 The responsibilities of the Contractor under the Design Assist Contract for completion of the Design Assist Contract and correction of defective work;

5.2 The responsibilities of the Contractor under the Design Assist Contract to pay liquidated damages, and damages for which no liquidated damages are specified in the Design Assist Contract, including but not limited to, all valid and proper back charges, offsets, payments, indemnities, defense costs or other damages; and

5.3 Additional legal, design professional and delay costs resulting from the Contractor Default or resulting from the actions or failure to act of the Surety under Paragraphs 3 or 4, above.

6. The Surety shall not be liable to the City or others for the obligations of the Contractor that are unrelated to the Design Assist Contract, and the Balance of the Total Contract Price shall not be reduced or set off on account of any such unrelated obligations. No right of action shall accrue on this Performance Bond to any person or entity other than the City or its heirs, executors, administrators, or successors.

7. The Surety hereby waives notice of any change, alteration or addition to the Design Assist Contract or to related subcontracts, purchase orders and other obligations, including but not limited to changes of time. The Surety consents to all terms of the Design Assist Contract, including provisions on changes to the Contract Documents. No extension of time, Change Order, alteration, Modification, deletion, or addition to the Contract Documents, or of the work required thereunder, shall release or exonerate Surety on this Performance Bond or in any way affect the obligations of Surety on this Performance Bond.

8. Any proceeding, legal or equitable, under this Performance Bond shall be instituted in any court of competent jurisdiction in Placer County, California within two (2) years after the Contractor Default or within two (2) years after the Contractor ceased working or within two (2) years after the Surety refuses or fails to perform its obligations under this Performance Bond, whichever occurs first. If the provisions of this Paragraph 8 are void or prohibited by law, the minimum period of limitation available to sureties as a defense in Placer County shall be applicable.

9. Notice to the Surety or the Principal shall be mailed or delivered to the address shown on the signature pages. Notice to City shall be delivered to:

City Clerk of City of Roseville
311 Vernon Street
Roseville, CA 95678

EXHIBIT G

PERFORMANCE BOND

Pleasant Grove Wastewater Treatment Plant Energy Recovery Project

10. Any provision in this Performance Bond conflicting with any statutory or regulatory requirement shall be deemed deleted herefrom and provisions conforming to such statutory requirement shall be deemed incorporated herein. The intent is that this Performance Bond shall be construed as a statutory bond and not as a common law bond.

LABOR AND MATERIAL BOND

Pleasant Grove Wastewater Treatment Plant Energy Recovery Project

Bond No. 070210386
Premium $ Included in Performance

LABOR AND MATERIAL BOND

This Labor and Material Bond ("Labor and Material Bond") dated October 2, 20 19, is in the penal sum of Twenty Three Million, Three Hundred Forty Nine Thousand, Seven Hundred Twenty Nine Dollars and 00/100 Dollars ($ 23,349,729.00), which is an amount not less than one hundred percent (100%) of the Total Contract Price, and is entered into by and between the undersigned W.M. Lyles Co. ("Principal" or "Contractor") and the undersigned Liberty Mutual Insurance Company ("Surety") to ensure the Principal's payment of claimants pursuant to the Agreement for the Design-Assist and Construction of the Pleasant Grove Wastewater Treatment Plant Energy Recovery Project ("Design Assist Contract"). This Labor and Material Bond consists of this page and the following Labor and Material Bond Terms and Conditions, Paragraphs 1 through 14. Any singular reference to the Principal, the Surety, the City of Roseville, California ("City") or other party shall be considered plural where applicable.

BOND TERMS AND CONDITIONS

1. The Principal and the Surety, jointly and severally, bind themselves, their heirs, executors, administrators, successors and assigns to the City and to Claimants, to pay for labor, materials, Equipment furnished and Services provided in the performance of the Design Assist Contract, which is incorporated herein by reference.

2. With respect to the City, this obligation shall become null and void if and when the Principal:

   2.1 Promptly and fully makes payment, directly or indirectly, for all sums due Claimants, and

   2.2 Fully defends, indemnifies and holds harmless the City from all claims, demands, liens or suits by any person or entity who furnished labor, materials or equipment for use in the performance of the Design Assist Contact, provided the City has promptly notified the Principal and the Surety (at the address described in Paragraph 12 below) of any claims, demands, liens or suits and has tendered defense of such claims, demands, liens or suits to the Principal and the Surety, and provided there is no City Default. Otherwise, this Labor and Material Bond shall be, and remain, in full force and effect.

3. With respect to Claimants, this obligation shall become null and void if and when the Principal promptly and fully makes payment, directly or indirectly through its Subcontractors, for all sums due Claimants; otherwise, this Labor and Material Bond shall be, and remain, in full force and effect.

LABOR AND MATERIAL BOND

EXHIBIT H

LABOR AND MATERIAL BOND

Pleasant Grove Wastewater Treatment Plant Energy Recovery Project

4. The Surety shall have no obligation to Claimants under this Labor and Material Bond until:

   4.1 Claimants who are employed by or have a direct contract with the Contractor have given notice to the Surety (at the address described in Paragraph 12) and sent a copy, or notice thereof, to the City, stating that a claim is being made under this Labor and Material Bond and, with substantial accuracy, the amount of the claim.

   4.2 Claimants who do not have a direct contract with the Contractor:

      4.2.1 Have furnished written notice to the Contractor and sent a copy, or notice thereof, to the City, within ninety (90) days after having last performed labor or last furnished materials or equipment included in the claim stating, with substantial accuracy, the amount of the claim and the name of the party to whom the materials were furnished or supplied or for whom the labor was done or performed; and

      4.2.2 Have either received a rejection in whole or in part from the Contractor, or have not received within thirty (30) days of furnishing the above notice any communication from the Contractor by which the Contractor has indicated the claim will be paid directly or indirectly; and

      4.3.3 Not having been paid within the above thirty (30) days, have sent a written notice to the Surety (at the address described in Paragraph 12) and sent a copy, or notice thereof, to the City, stating that a claim is being made under this Labor and Material Bond and enclosing a copy of the previous written notice furnished to the Contractor.

5. If a notice required by Paragraph 4 above is given by the City to the Contractor or to the Surety, that shall be considered sufficient compliance.

6. When the Claimant has satisfied the conditions of Paragraph 4, the Surety shall promptly and at the Surety's expense take the following actions:

   6.1 Send an answer to the Claimant, with a copy to the City, within forty-five (45) days after receipt of the claim, stating the amounts that are undisputed and the basis for challenging any amounts that are disputed.

   6.2 Pay or arrange for payment of any undisputed amounts.

7. The Surety's total obligation shall not exceed the amount of this Labor and Material Bond, and the amount of this Labor and Material Bond shall be credited for any payments made in good faith by the Surety under this Labor and Material Bond.

EXHIBIT H-2

LABOR AND MATERIAL BOND

8. Amounts due the Contractor under the Design Assist Contract shall be applied to satisfy claims, if any, under this Labor and Material Bond.

9. The Surety shall not be liable to the City, Claimants or others for obligations of the Contractor that are unrelated to the Design Assist Contract. The City shall not be liable for payment of any costs, expenses, or attorney's fees of any Claimant under this Labor and Material Bond, and shall have no obligations to make payments to, give notices on behalf of, or otherwise have obligations to Claimants under this Labor and Material Bond.

10. The Surety hereby waives notice of any change, alteration or addition to the Design Assist Contract or to related subcontracts, purchase orders and other obligations, including but not limited to changes of time. The Surety consents to all terms of the Design Assist Contract, including provisions on changes to the Contract Documents. No extension of time, Change Order, alteration, modification, deletion, or addition to the Contract Documents, or of the work required thereunder, shall release or exonerate Surety on this Labor and Material Bond or in any way affect the obligations of Surety on this Labor and Material Bond.

11. Any proceeding, legal or equitable, under this Labor and Material Bond shall be instituted in any court of competent jurisdiction in Placer County, California within one (1) year from the date on which (i) the Claimant gave the notice required by Paragraph 4.1 or Paragraph 4.3.3, or (ii) the last labor or service was performed by anyone or the last materials or equipment were furnished by anyone under the Design Assist Contract, whichever of (i) or (ii) first occurs. If the provisions of this Paragraph 11 are void or prohibited by law, the minimum period of limitation available to sureties as a defense in Placer County shall be applicable.

12. Notice to the Surety or the Principal shall be mailed or delivered to the address shown on the signature page below. Actual receipt of notice by the Surety, the City or the Principal, however accomplished, shall be sufficient compliance as of the date received at the address shown on the signature page below. Notice to City shall be delivered to:

    City Clerk of City of Roseville
    311 Vernon Street
    Roseville, CA 95678

13. Any provision in this Labor and Material Bond conflicting with any statutory or regulatory requirement shall be deemed deleted herefrom and provisions conforming to such statutory requirement shall be deemed incorporated herein.

    The intent is that this Labor and Material Bond shall be construed as a statutory bond and not as a common law bond.

This Power of Attorney is made and executed pursuant to and by authority of the following By-laws and Authorizations of The Ohio Casualty Insurance Company, Liberty Mutual Insurance Company, and West American Insurance Company which resolutions are now in full force and effect reading as follows:

ARTICLE IV – OFFICERS: Section 12. Power of Attorney.
Any officer or other official of the Corporation authorized for that purpose in writing by the Chairman or the President, and subject to such limitation as the Chairman or the President may prescribe, shall appoint such attorneys-in-fact, as may be necessary to act in behalf of the Corporation to make, execute, seal, acknowledge and deliver as surety any and all undertakings, bonds, recognizances and other surety obligations. Such attorneys-in-fact, subject to the limitations set forth in their respective powers of attorney, shall have full power to bind the Corporation by their signature and execution of any such instruments and to attach thereto the seal of the Corporation. When so executed, such instruments shall be as binding as if signed by the President and attested to by the Secretary. Any power or authority granted to any representative or attorney-in-fact under the provisions of this article may be revoked at any time by the Board, the Chairman, the President or by the officer or officers granting such power or authority.

ARTICLE XIII – Execution of Contracts: Section 5. Surety Bonds and Undertakings.
Any officer of the Company authorized for that purpose in writing by the chairman or the president, and subject to such limitations as the chairman or the president may prescribe, shall appoint such attorneys-in-fact, as may be necessary to act in behalf of the Company to make, execute, seal, acknowledge and deliver as surety any and all undertakings, bonds, recognizances and other surety obligations. Such attorneys-in-fact subject to the limitations set forth in their respective powers of attorney, shall have full power to bind the Company by their signature and execution of any such instruments and to attach thereto the seal of the Company. When so executed such instruments shall be as binding as if signed by the president and attested by the secretary.

Certificate of Designation – The President of the Company, acting pursuant to the Bylaws of the Company, authorizes David M. Carey, Assistant Secretary to appoint such attorneys-in-fact as may be necessary to act on behalf of the Company to make, execute, seal, acknowledge and deliver as surety any and all undertakings, bonds, recognizances and other surety obligations.

Authorization – By unanimous consent of the Company's Board of Directors, the Company consents that facsimile or mechanically reproduced signature of any assistant secretary of the Company, wherever appearing upon a certified copy of any power of attorney issued by the Company in connection with surety bonds, shall be valid and binding upon the Company with the same force and effect as though manually affixed.

I, Renee C. Llewellyn, the undersigned, Assistant Secretary, The Ohio Casualty Insurance Company, Liberty Mutual Insurance Company, and West American Insurance Company do hereby certify that the original power of attorney of which the foregoing is a full, true and correct copy of the Power of Attorney executed by said Companies, is in full force and effect and has not been revoked.

IN TESTIMONY WHEREOF, I have hereunto set my hand and affixed the seals of said Companies this 2 day of October 2019

WARRANTY BOND
(This document shall be executed by Contractor before all Work has been Substantially Complete)

Pleasant Grove Wastewater Treatment Plant Energy Recovery Project

EXHIBIT I

WARRANTY BOND

Pleasant Grove Wastewater Treatment Plant Energy Recovery Project

Bond No. _____
Premium $_____

WARRANTY BOND

This Warranty Bond ("Warranty Bond"), dated _____, 20___, is in the penal sum of _____ for the Agreement for the Design-Assist and Construction of the Pleasant Grove Wastewater Treatment Plant Energy Recovery Project ("Design Assist Contract"), and is entered into by and between the undersigned _____ ("Principal" or "Contractor") and the undersigned _____ ("Surety") to guaranty that all Equipment and Services provided by Contractor under the above-mentioned Design Assist Contract will fulfill the requirements of Contractor's warranties and guarantees included in the Design Assist Contract. This Warranty Bond consists of this page and the following Warranty Bond Terms and Conditions, Paragraphs 1 through 7. Any singular reference to the Principal/Contactor, the Surety, the City of Roseville, California ("City") or other party shall be considered plural where applicable.

BOND TERMS AND CONDITIONS

1. The Principal and the Surety, jointly and severally, bind themselves, their heirs, executors, administrators, successors and assigns to the City for a period of one (1) year following the date of Final Completion, or such longer period specified in the Design Assist Contract, its unconditional warranty of the quality and adequacy of all of the work including, without limitation, all equipment and work provided by Contractor and its subcontractors and subvendors of all tiers in connection with the Design Assist Contract.

2. Neither final payment nor use or occupancy of the Equipment or Services performed by the Contractor shall constitute an acceptance of such Equipment or Services not done in accordance with this Warranty Bond or relieve Contractor of liability in respect to any express guarantees, warranties or responsibilities for faulty materials or workmanship, ordinary wear and tear excepted. If within one (1) year after the date of Final Completion, or such longer period of time as may be prescribed the terms of the Contract Documents, any Equipment or Services is found to be defective, Contractor and Surety shall promptly, without cost to City and in accordance with City's written instructions, correct such defective Equipment or Services. Contractor and Surety shall remove any defective Equipment rejected by City and replace it with Equipment that is not defective. If Contractor or Surety fails to promptly comply with the terms of such instructions, or in an emergency where delay would cause serious risk of loss or damage, City may have the defective Equipment or Services corrected or removed and replaced. Contractor and Surety shall pay for all claims, costs, losses and damages caused by or resulting from such removal and replacement. Where Contractor and Surety fail to correct defective Equipment or Services, or defects are discovered outside the correction period, City shall have all rights and remedies granted by law.

3. As part of the obligation secured hereby and in addition to the face amount specified therefor, there shall be included costs and reasonable expenses and fees, including reasonable attorney's fees, incurred by City.

4. The Surety hereby waives notice of any change, alteration or addition to the Design Assist Contract or to related subcontracts, purchase orders and other obligations, including but not limited to changes of time. The Surety consents to all terms of the Design Assist Contract, including provisions on changes to the Contract Documents. No extension of time, Change Order, alteration, Modification, deletion, or addition to the Contract Documents, or of the work required thereunder, shall release or exonerate Surety on this Warranty Bond or in any way affect the obligations of Surety on this Warranty Bond.

5. If the Surety does not proceed as provided in Paragraph 2 above, then the Surety shall be deemed to be in default on this Warranty Bond ten (10) calendar days after receipt of an additional written notice from City to the Surety demanding that the Surety perform its obligations under this Warranty Bond. At all times the City shall be entitled to enforce any remedy available to the City at law or under the Design Assist Contract including, without limitation, and by way of example only, rights to perform work as Surety's expense, protect work, mitigate damages, or coordinate work with other consultants or contractors.

6. All abbreviations and definitions of terms used in this Warranty Bond shall have the meanings set forth in the Contract Documents, including, without means of limitation, the Design Assist Contract.

7. The foregoing Warranty Bond is in addition to any other guarantees and warranties of Contractor contained in the Contract Documents, and not in lieu of, any and all other liability imposed on Contractor under the Contract Documents and at law with respect to Contractor's duties, obligations, and performance under the Design Assist Contract. In the event of any conflict or inconsistency between the terms of this Warranty Bond and any guaranty, warranty or obligation of the Seller under the Design Assist Contract or at law, such inconsistency or conflict shall be resolved in favor of the higher level of obligation of the Contractor and Surety.

8. Notice to the Surety or the Principal shall be mailed or delivered to the address shown on the signature page below. Actual receipt of notice by the Surety, the City or the Principal, however accomplished, shall be sufficient compliance as of the date received at the address shown on the signature page below. Notice to City shall be delivered to:

ESCROW AGREEMENT FOR SECURITY DEPOSITS IN LIEU OF RETENTION

Pleasant Grove Wastewater Treatment Plant Energy Recovery Project

EXHIBIT J

ESCROW No. 1669

ESCROW AGREEMENT FOR SECURITY DEPOSITS IN LIEU OF RETENTION

(Project: PGWWTP Energy Recovery)

THIS ESCROW AGREEMENT is made and entered into on this 11th day of October, 2019 by and between the:

City of Roseville, whose address is:

311 Vernon Street
Roseville, CA 95678

(hereinafter called "CITY"); and

W. M. Lyles Co., whose address is:
1210 W. Olive Ave., Fresno, CA 93728
PO Box 4438, Fresno, CA 93744

(hereinafter called "CONTRACTOR"); and

Banner Bank, whose address is:
5901 Priestly Dr.,Suite 160
Carlsbad, CA 92008

(hereinafter called "ESCROW AGENT").

For the consideration hereinafter set forth, CITY, CONTRACTOR, and ESCROW AGENT agree as follows:

1. Pursuant to Section 22300 of the Public Contract Code of the State of California, CONTRACTOR has the option to deposit securities, subject to prior approval of CITY, with ESCROW AGENT, as a substitute for retention earnings required to be withheld by CITY pursuant to the contract for public works entered into between the CITY and CONTRACTOR for the Project in the amount of Twenty Three Million, Three Hundred Forty Nine Thousand, Seven Hundred Twenty Nine dollars ($23,349,729.09) dated November 6, 2019, (hereinafter

referred to as the "Contract"). Alternatively, on written request of CONTRACTOR, CITY shall make payments of the retention earnings directly to the ESCROW AGENT.

When CONTRACTOR deposits the securities as a substitute for Contract earnings, the ESCROW AGENT shall notify CITY within ten (10) days of the deposit. The market value of the securities at the time of the substitution shall be at least equal to the cash amount then required to be withheld as retention under the terms of the Contract between CITY and CONTRACTOR. Securities shall be held in the name of ESCROW AGENT, and shall designate CONTRACTOR as the beneficial owner, and shall be limited to those types of acceptable securities as described in Public Contract Code Section 22300.

2. CITY shall make progress payments to CONTRACTOR for those funds which otherwise would be withheld from progress payments pursuant to the Contract provisions, provided that ESCROW AGENT holds securities in the form and amount specified above.

3. When CITY makes payment of retentions earned directly to ESCROW AGENT, ESCROW AGENT shall hold them for the benefit of CONTRACTOR until the time that the escrow created under this Agreement is terminated. CONTRACTOR may direct the investment of the payments into securities. All terms and conditions of this Agreement and the rights and responsibilities of the parties shall be equally applicable and binding when CITY pays ESCROW AGENT directly.

4. CONTRACTOR shall be responsible for paying all fees for the expenses incurred by ESCROW AGENT in administering the Escrow Account and all expenses of CITY. These expenses and payment terms shall be determined by CITY, CONTRACTOR, and ESCROW AGENT.

5. The interest earned on the securities or the money market accounts held in escrow and all interest earning on that interest shall be for the sole account of CONTRACTOR and shall

be subject to withdrawal by CONTRACTOR at any time and from time to time without notice to CITY.

6. CONTRACTOR shall have the right to withdraw all or any part of the principal in the Escrow Account only by written notice to ESCROW AGENT accompanied by written authorization from CITY to ESCROW AGENT that CITY consents to the withdrawal of the amount sought to be withdrawn by CONTRACTOR.

7. CITY shall have a right to draw upon the securities in the event of default by CONTRACTOR. Upon seven (7) days' written notice to ESCROW AGENT from CITY of the default, ESCROW AGENT shall immediately convert the securities to cash and shall distribute the cash as instructed by CITY.

8. Only upon receipt of written notification from CITY certifying that the Contract is final and complete, and that CONTRACTOR has complied with all requirements and procedures applicable to the Contract, ESCROW AGENT shall release to CONTRACTOR all securities and interest on deposit less escrow fees and charges of the Escrow Account. The escrow shall be closed immediately upon disbursement of all moneys and securities on deposit and payments of fees and charges.

9. ESCROW AGENT shall rely on the written notifications from CITY and CONTRACTOR pursuant to Sections (5) to (8), inclusive, of this Agreement and CONTRACTOR shall hold ESCROW AGENT harmless from ESCROW AGENT's release and disbursement of the securities and interest as set forth above.

10. The parties hereto mutually agree that this Agreement is substantially similar to the form under Public Contracts Code Section 22300.

11. The names of the persons who are authorized to give written notice or to receive written notice on behalf of CITY and on behalf of CONTRACTOR in connection with the foregoing, and exemplars of their respective signatures are as follows:

On behalf of CITY:

Environmental Utilities Director
Title

ADDITIONAL INSURED – OWNERS, LESSEES OR CONTRACTORS – SCHEDULED PERSON OR ORGANIZATION

This endorsement modifies insurance provided under the following:

COMMERCIAL GENERAL LIABILITY COVERAGE PART

SCHEDULE

Name Of Additional Insured Person(s) Or Organization(s)	Location(s) Of Covered Operations
Any person or organization contractually requiring status as an additional insured for ongoing operations that you perform for them	The locations as specified in the written contracts or agreements
Information required to complete this Schedule, if not shown above, will be shown in the Declarations.	

A. Section II – Who Is An Insured is amended to include as an additional insured the person(s) or organization(s) shown in the Schedule, but only with respect to liability for "bodily injury", "property damage" or "personal and advertising injury" caused, in whole or in part, by:

1. Your acts or omissions; or
2. The acts or omissions of those acting on your behalf;

in the performance of your ongoing operations for the additional insured(s) at the location(s) designated above.

However:

1. The insurance afforded to such additional insured only applies to the extent permitted by law; and
2. If coverage provided to the additional insured is required by a contract or agreement, the insurance afforded to such additional insured will not be broader than that which you are required by the contract or agreement to provide for such additional insured.

B. With respect to the insurance afforded to these additional insureds, the following additional exclusions apply:

This insurance does not apply to "bodily injury" or "property damage" occurring after:

1. All work, including materials, parts or equipment furnished in connection with such work, on the project (other than service, maintenance or repairs) to be performed by or on behalf of the additional insured(s) at the location of the covered operations has been completed; or
2. That portion of "your work" out of which the injury or damage arises has been put to its intended use by any person or organization other than another contractor or subcontractor engaged in performing operations for a principal as a part of the same project.

© Insurance Services Office, Inc., 2012

C. With respect to the insurance afforded to these additional insureds, the following is added to **Section III – Limits Of Insurance:**

If coverage provided to the additional insured is required by a contract or agreement, the most we will pay on behalf of the additional insured is the amount of insurance:

1. Required by the contract or agreement; or
2. Available under the applicable Limits of Insurance shown in the Declarations;

whichever is less.

This endorsement shall not increase the applicable Limits of Insurance shown in the Declarations.

ADDITIONAL INSURED – OWNERS, LESSEES OR CONTRACTORS – COMPLETED OPERATIONS

This endorsement modifies insurance provided under the following:

COMMERCIAL GENERAL LIABILITY COVERAGE PART
PRODUCTS/COMPLETED OPERATIONS LIABILITY COVERAGE PART

SCHEDULE

Name Of Additional Insured Person(s) Or Organization(s)	Location And Description Of Completed Operations
As required by written contract or agreement	The locations as specified in the written contracts or agreements
Information required to complete this Schedule, if not shown above, will be shown in the Declarations.	

A. **Section II – Who Is An Insured** is amended to include as an additional insured the person(s) or organization(s) shown in the Schedule, but only with respect to liability for "bodily injury" or "property damage" caused, in whole or in part, by "your work" at the location designated and described in the Schedule of this endorsement performed for that additional insured and included in the "products-completed operations hazard".

However:

1. The insurance afforded to such additional insured only applies to the extent permitted by law; and
2. If coverage provided to the additional insured is required by a contract or agreement, the insurance afforded to such additional insured will not be broader than that which you are required by the contract or agreement to provide for such additional insured.

B. With respect to the insurance afforded to these additional insureds, the following is added to **Section III – Limits Of Insurance:**

If coverage provided to the additional insured is required by a contract or agreement, the most we will pay on behalf of the additional insured is the amount of insurance:

1. Required by the contract or agreement; or
2. Available under the applicable Limits of Insurance shown in the Declarations;

whichever is less.

This endorsement shall not increase the applicable Limits of Insurance shown in the Declarations.

PRIMARY AND NONCONTRIBUTORY – OTHER INSURANCE CONDITION

This endorsement modifies insurance provided under the following:

COMMERCIAL GENERAL LIABILITY COVERAGE PART
PRODUCTS/COMPLETED OPERATIONS LIABILITY COVERAGE PART

The following is added to the **Other Insurance** Condition and supersedes any provision to the contrary:

Primary And Noncontributory Insurance

This insurance is primary to and will not seek contribution from any other insurance available to an additional insured under your policy provided that:

(1) The additional insured is a Named Insured under such other insurance; and

(2) You have agreed in writing in a contract or agreement that this insurance would be primary and would not seek contribution from any other insurance available to the additional insured.

DESIGNATED CONSTRUCTION PROJECT(S) GENERAL AGGREGATE LIMIT

This endorsement modifies insurance provided under the following:

COMMERCIAL GENERAL LIABILITY COVERAGE PART

SCHEDULE

Designated Construction Project(s):
The projects as specified in the written contracts or agreements
Information required to complete this Schedule, if not shown above, will be shown in the Declarations.

A. For all sums which the insured becomes legally obligated to pay as damages caused by "occurrences" under Section I – Coverage A, and for all medical expenses caused by accidents under Section I – Coverage C, which can be attributed only to ongoing operations at a single designated construction project shown in the Schedule above:

1. A separate Designated Construction Project General Aggregate Limit applies to each designated construction project, and that limit is equal to the amount of the General Aggregate Limit shown in the Declarations.
2. The Designated Construction Project General Aggregate Limit is the most we will pay for the sum of all damages under Coverage A, except damages because of "bodily injury" or "property damage" included in the "products-completed operations hazard", and for medical expenses under Coverage C regardless of the number of:
   a. Insureds;
   b. Claims made or "suits" brought; or
   c. Persons or organizations making claims or bringing "suits".
3. Any payments made under Coverage A for damages or under Coverage C for medical expenses shall reduce the Designated Construction Project General Aggregate Limit for that designated construction project. Such payments shall not reduce the General Aggregate Limit shown in the Declarations nor shall they reduce any other Designated Construction Project General Aggregate Limit for any other designated construction project shown in the Schedule above.
4. The limits shown in the Declarations for Each Occurrence, Damage To Premises Rented To You and Medical Expense continue to apply. However, instead of being subject to the General Aggregate Limit shown in the Declarations, such limits will be subject to the applicable Designated Construction Project General Aggregate Limit.

WAIVER OF TRANSFER OF RIGHTS OF RECOVERY AGAINST OTHERS TO US

This endorsement modifies insurance provided under the following:

COMMERCIAL GENERAL LIABILITY COVERAGE PART
PRODUCTS/COMPLETED OPERATIONS LIABILITY COVERAGE PART

SCHEDULE

Name Of Person Or Organization:
Any persons or organizations requiring a waiver of transfer of rights of recovery pursuant to the terms of any contract or agreement you enter into with such person or organization
Information required to complete this Schedule, if not shown above, will be shown in the Declarations.

The following is added to Paragraph **8. Transfer Of Rights Of Recovery Against Others To Us** of **Section IV – Conditions:**

We waive any right of recovery we may have against the person or organization shown in the Schedule above because of payments we make for injury or damage arising out of your ongoing operations or "your work" done under a contract with that person or organization and included in the "products-completed operations hazard". This waiver applies only to the person or organization shown in the Schedule above.

A. Paragraphs **2.** and **3.** of the **Cancellation** Common Policy Condition are replaced by the following:

2. All Policies In Effect For 60 Days Or Less

If this policy has been in effect for 60 days or less, and is not a renewal of a policy we have previously issued, we may cancel this policy by mailing or delivering to the first Named Insured, at the mailing address shown in the policy, and to the producer of record, advance written notice of cancellation, stating the reason for cancellation, at least:

a. 10 days before the effective date of cancellation if we cancel for:

(1) Nonpayment of premium; or

(2) Discovery of fraud by:

(a) Any insured or his or her representative in obtaining this insurance; or

(b) You or your representative in pursuing a claim under this policy.

b. 30 days before the effective date of cancellation if we cancel for any other reason.

3. All Policies In Effect For More Than 60 Days

a. If this policy has been in effect for more than 60 days, or is a renewal of a policy we issued, we may cancel this policy only upon the occurrence, after the effective date of the policy, of one or more of the following:

(1) Nonpayment of premium, including payment due on a prior policy we issued and due during the current policy term covering the same risks.

(2) Discovery of fraud or material misrepresentation by:

(a) Any insured or his or her representative in obtaining this insurance; or

(b) You or your representative in pursuing a claim under this policy.

(3) A judgment by a court or an administrative tribunal that you have violated a California or Federal law, having as one of its necessary elements an act which materially increases any of the risks insured against.

© Insurance Services Office, Inc., 2012

(4) Discovery of willful or grossly negligent acts or omissions, or of any violations of state laws or regulations establishing safety standards, by you or your representative, which materially increase any of the risks insured against.

(5) Failure by you or your representative to implement reasonable loss control requirements, agreed to by you as a condition of policy issuance, or which were conditions precedent to our use of a particular rate or rating plan, if that failure materially increases any of the risks insured against.

(6) A determination by the Commissioner of Insurance that the:

(a) Loss of, or changes in, our reinsurance covering all or part of the risk would threaten our financial integrity or solvency; or

(b) Continuation of the policy coverage would:

(i) Place us in violation of California law or the laws of the state where we are domiciled; or

(ii) Threaten our solvency.

(7) A change by you or your representative in the activities or property of the commercial or industrial enterprise, which results in a materially added, increased or changed risk, unless the added, increased or changed risk is included in the policy.

b. We will mail or deliver advance written notice of cancellation, stating the reason for cancellation, to the first Named Insured, at the mailing address shown in the policy, and to the producer of record, at least:

(1) 10 days before the effective date of cancellation if we cancel for nonpayment of premium or discovery of fraud; or

(2) 30 days before the effective date of cancellation if we cancel for any other reason listed in Paragraph **3.a.**

B. The following provision is added to the **Cancellation** Common Policy Condition:

7. Residential Property

This provision applies to coverage on real property which is used predominantly for residential purposes and consisting of not more than four dwelling units, and to coverage on tenants' household personal property in a residential unit, if such coverage is written under one of the following:

Commercial Property Coverage Part

Farm Coverage Part – Farm Property – Farm Dwellings, Appurtenant Structures And Household Personal Property Coverage Form

a. If such coverage has been in effect for 60 days or less, and is not a renewal of coverage we previously issued, we may cancel this coverage for any reason, except as provided in **b.** and **c.** below.

b. We may not cancel this policy solely because the first Named Insured has:

(1) Accepted an offer of earthquake coverage; or

(2) Cancelled or did not renew a policy issued by the California Earthquake Authority (CEA) that included an earthquake policy premium surcharge.

However, we shall cancel this policy if the first Named Insured has accepted a new or renewal policy issued by the CEA that includes an earthquake policy premium surcharge but fails to pay the earthquake policy premium surcharge authorized by the CEA.

c. We may not cancel such coverage solely because corrosive soil conditions exist on the premises. This restriction **(c.)** applies only if coverage is subject to one of the following, which exclude loss or damage caused by or resulting from corrosive soil conditions:

(1) Commercial Property Coverage Part – Causes Of Loss – Special Form; or

(2) Farm Coverage Part – Causes Of Loss Form – Farm Property, Paragraph **D.** Covered Causes Of Loss – Special.

© Insurance Services Office, Inc., 2012

C. The following is added and supersedes any provisions to the contrary:

Nonrenewal

1. Subject to the provisions of Paragraphs **C.2.** and **C.3.** below, if we elect not to renew this policy, we will mail or deliver written notice, stating the reason for nonrenewal, to the first Named Insured shown in the Declarations, and to the producer of record, at least 60 days, but not more than 120 days, before the expiration or anniversary date.

   We will mail or deliver our notice to the first Named Insured, and to the producer of record, at the mailing address shown in the policy.

2. **Residential Property**

   This provision applies to coverage on real property used predominantly for residential purposes and consisting of not more than four dwelling units, and to coverage on tenants' household property contained in a residential unit, if such coverage is written under one of the following:

   Commercial Property Coverage Part

   Farm Coverage Part – Farm Property – Farm Dwellings, Appurtenant Structures And Household Personal Property Coverage Form

   a. We may elect not to renew such coverage for any reason, except as provided in **b.**, **c.** and **d.** below.

   b. We will not refuse to renew such coverage solely because the first Named Insured has accepted an offer of earthquake coverage.

      However, the following applies only to insurers who are associate participating insurers as established by Cal. Ins. Code Section 10089.16. We may elect not to renew such coverage after the first Named Insured has accepted an offer of earthquake coverage, if one or more of the following reasons applies:

      (1) The nonrenewal is based on sound underwriting principles that relate to the coverages provided by this policy and that are consistent with the approved rating plan and related documents filed with the Department of Insurance as required by existing law;

      (2) The Commissioner of Insurance finds that the exposure to potential losses will threaten our solvency or place us in a hazardous condition. A hazardous condition includes, but is not limited to, a condition in which we make claims payments for losses resulting from an earthquake that occurred within the preceding two years and that required a reduction in policyholder surplus of at least 25% for payment of those claims; or

      (3) We have:

         (a) Lost or experienced a substantial reduction in the availability or scope of reinsurance coverage; or

         (b) Experienced a substantial increase in the premium charged for reinsurance coverage of our residential property insurance policies; and

      the Commissioner has approved a plan for the nonrenewals that is fair and equitable, and that is responsive to the changes in our reinsurance position.

   c. We will not refuse to renew such coverage solely because the first Named Insured has cancelled or did not renew a policy, issued by the California Earthquake Authority, that included an earthquake policy premium surcharge.

   d. We will not refuse to renew such coverage solely because corrosive soil conditions exist on the premises. This restriction **(d.)** applies only if coverage is subject to one of the following, which exclude loss or damage caused by or resulting from corrosive soil conditions:

      (1) Commercial Property Coverage Part – Causes Of Loss – Special Form; or

      (2) Farm Coverage Part – Causes Of Loss Form – Farm Property, Paragraph **D.** Covered Causes Of Loss – Special.

3. We are not required to send notice of nonrenewal in the following situations:

   a. If the transfer or renewal of a policy, without any changes in terms, conditions or rates, is between us and a member of our insurance group.

© Insurance Services Office, Inc., 2012

b. If the policy has been extended for 90 days or less, provided that notice has been given in accordance with Paragraph **C.1.**

c. If you have obtained replacement coverage, or if the first Named Insured has agreed, in writing, within 60 days of the termination of the policy, to obtain that coverage.

d. If the policy is for a period of no more than 60 days and you are notified at the time of issuance that it will not be renewed.

e. If the first Named Insured requests a change in the terms or conditions or risks covered by the policy within 60 days of the end of the policy period.

f. If we have made a written offer to the first Named Insured, in accordance with the timeframes shown in Paragraph **C.1.**, to renew the policy under changed terms or conditions or at an increased premium rate, when the increase exceeds 25%.

DESIGNATED INSURED FOR COVERED AUTOS LIABILITY COVERAGE

This endorsement modifies insurance provided under the following:

AUTO DEALERS COVERAGE FORM
BUSINESS AUTO COVERAGE FORM
MOTOR CARRIER COVERAGE FORM

With respect to coverage provided by this endorsement, the provisions of the Coverage Form apply unless modified by this endorsement.

This endorsement identifies person(s) or organization(s) who are "insureds" for Covered Autos Liability Coverage under the Who Is An Insured provision of the Coverage Form. This endorsement does not alter coverage provided in the Coverage Form.

This endorsement changes the policy effective on the inception date of the policy unless another date is indicated below.

Named Insured: W.M. Lyles Co.

Endorsement Effective Date: 05/31/2019

SCHEDULE

Name Of Person(s) Or Organization(s):
All Persons or organizations as required by contract or agreement
Information required to complete this Schedule, if not shown above, will be shown in the Declarations.

Each person or organization shown in the Schedule is an "insured" for Covered Autos Liability Coverage, but only to the extent that person or organization qualifies as an "insured" under the Who Is An Insured provision contained in Paragraph **A.1.** of Section II – Covered Autos Liability Coverage in the Business Auto and Motor Carrier Coverage Forms and Paragraph **D.2.** of Section I – Covered Autos Coverages of the Auto Dealers Coverage Form.

© Insurance Services Office, Inc., 2011

POLICY NUMBER: MWTB31334319

COMMERCIAL AUTO

INSURED: W.M. LYLES Co

EFFECTIVE: 5/31/2019

COMPANY: OLD REPUBLIC INSURANCE COMPANY

BUSINESS AUTO COVERAGE FORM

5. Other Insurance

a. For any covered "auto" you own this Coverage Form provides primary insurance For any covered "auto" you don't own the insurance provided by this Coverage Form is excess over any other collectible insurance However while a covered "auto" which is a "trailer" is connected to another vehicle the Covered Autos Liability Coverage this Coverage Form provides for the "trailer" is

(1) Excess while it is connected to a motor vehicle you do not own or

(2) Primary while it is connected to a covered "auto" you own

b. For Hired Auto Physical Damage Coverage any covered "auto" you lease hire rent or borrow is deemed to be a covered "auto" you own However any "auto" that is leased hired rented or borrowed with a driver is not a covered "auto"

c. Regardless of the provisions of Paragraph

a. above this Coverage Form's Covered Autos Liability Coverage is primary for any liability assumed under an "insured contract"

d. When this Coverage Form and any other Coverage Form or policy covers on the same basis either excess or primary we will pay only our share Our share is the proportion that the Limit of Insurance of our Coverage Form bears to the total of the limits of all the Coverage Forms and policies covering on the same basis

4. **Loss Payment – Physical Damage Coverages**

   At our option, we may:

   a. Pay for, repair or replace damaged or stolen property;

   b. Return the stolen property, at our expense. We will pay for any damage that results to the "auto" from the theft; or

   c. Take all or any part of the damaged or stolen property at an agreed or appraised value.

   If we pay for the "loss", our payment will include the applicable sales tax for the damaged or stolen property.

5. **Transfer Of Rights Of Recovery Against Others To Us**

   If any person or organization to or for whom we make payment under this Coverage Form has rights to recover damages from another, those rights are transferred to us. That person or organization must do everything necessary to secure our rights and must do nothing after "accident" or "loss" to impair them.

B. General Conditions

1. **Bankruptcy**

   Bankruptcy or insolvency of the "insured" or the "insured's" estate will not relieve us of any obligations under this Coverage Form.

2. **Concealment, Misrepresentation Or Fraud**

   This Coverage Form is void in any case of fraud by you at any time as it relates to this Coverage Form. It is also void if you or any other "insured", at any time, intentionally conceals or misrepresents a material fact concerning:

   a. This Coverage Form;

   b. The covered "auto";

   c. Your interest in the covered "auto"; or

   d. A claim under this Coverage Form.

3. **Liberalization**

   If we revise this Coverage Form to provide more coverage without additional premium charge, your policy will automatically provide the additional coverage as of the day the revision is effective in your state.

4. **No Benefit To Bailee – Physical Damage Coverages**

   We will not recognize any assignment or grant any coverage for the benefit of any person or organization holding, storing or transporting property for a fee regardless of any other provision of this Coverage Form.

5. **Other Insurance**

   a. For any covered "auto" you own, this Coverage Form provides primary insurance. For any covered "auto" you don't own, the insurance provided by this Coverage Form is excess over any other collectible insurance. However, while a covered "auto" which is a "trailer" is connected to another vehicle, the Covered Autos Liability Coverage this Coverage Form provides for the "trailer" is:

      (1) Excess while it is connected to a motor vehicle you do not own; or

      (2) Primary while it is connected to a covered "auto" you own.

   b. For Hired Auto Physical Damage Coverage, any covered "auto" you lease, hire, rent or borrow is deemed to be a covered "auto" you own. However, any "auto" that is leased, hired, rented or borrowed with a driver is not a covered "auto".

   c. Regardless of the provisions of Paragraph a. above, this Coverage Form's Covered Autos Liability Coverage is primary for any liability assumed under an "insured contract".

   d. When this Coverage Form and any other Coverage Form or policy covers on the same basis, either excess or primary, we will pay only our share. Our share is the proportion that the Limit of Insurance of our Coverage Form bears to the total of the limits of all the Coverage Forms and policies covering on the same basis.

6. **Premium Audit**

   a. The estimated premium for this Coverage Form is based on the exposures you told us you would have when this policy began. We will compute the final premium due when we determine your actual exposures. The estimated total premium will be credited against the final premium due and the first Named Insured will be billed for the balance, if any. The due date for the final premium or retrospective premium is the date shown as the due date on the bill. If the estimated total premium exceeds the final premium due, the first Named Insured will get a refund.

   b. If this policy is issued for more than one year, the premium for this Coverage Form will be computed annually based on our rates or premiums in effect at the beginning of each year of the policy.

A. Paragraphs **2.** and **3.** of the **Cancellation** Common Policy Condition are replaced by the following:

2. All Policies In Effect For 60 Days Or Less

If this policy has been in effect for 60 days or less, and is not a renewal of a policy we have previously issued, we may cancel this policy by mailing or delivering to the first Named Insured, at the mailing address shown in the policy, and to the producer of record, advance written notice of cancellation, stating the reason for cancellation, at least:

a. 10 days before the effective date of cancellation if we cancel for:

(1) Nonpayment of premium; or

(2) Discovery of fraud by:

(a) Any insured or his or her representative in obtaining this insurance; or

(b) You or your representative in pursuing a claim under this policy.

b. 30 days before the effective date of cancellation if we cancel for any other reason.

3. All Policies In Effect For More Than 60 Days

a. If this policy has been in effect for more than 60 days, or is a renewal of a policy we issued, we may cancel this policy only upon the occurrence, after the effective date of the policy, of one or more of the following:

(1) Nonpayment of premium, including payment due on a prior policy we issued and due during the current policy term covering the same risks.

(2) Discovery of fraud or material misrepresentation by:

(a) Any insured or his or her representative in obtaining this insurance; or

(b) You or your representative in pursuing a claim under this policy.

(3) A judgment by a court or an administrative tribunal that you have violated a California or Federal law, having as one of its necessary elements an act which materially increases any of the risks insured against.

© Insurance Services Office, Inc., 2012

(4) Discovery of willful or grossly negligent acts or omissions, or of any violations of state laws or regulations establishing safety standards, by you or your representative, which materially increase any of the risks insured against.

(5) Failure by you or your representative to implement reasonable loss control requirements, agreed to by you as a condition of policy issuance, or which were conditions precedent to our use of a particular rate or rating plan, if that failure materially increases any of the risks insured against.

(6) A determination by the Commissioner of Insurance that the:

(a) Loss of, or changes in, our reinsurance covering all or part of the risk would threaten our financial integrity or solvency; or

(b) Continuation of the policy coverage would:

(i) Place us in violation of California law or the laws of the state where we are domiciled; or

(ii) Threaten our solvency.

(7) A change by you or your representative in the activities or property of the commercial or industrial enterprise, which results in a materially added, increased or changed risk, unless the added, increased or changed risk is included in the policy.

b. We will mail or deliver advance written notice of cancellation, stating the reason for cancellation, to the first Named Insured, at the mailing address shown in the policy, and to the producer of record, at least:

(1) 10 days before the effective date of cancellation if we cancel for nonpayment of premium or discovery of fraud; or

(2) 30 days before the effective date of cancellation if we cancel for any other reason listed in Paragraph **3.a.**

B. The following provision is added to the **Cancellation** Common Policy Condition:

7. Residential Property

This provision applies to coverage on real property which is used predominantly for residential purposes and consisting of not more than four dwelling units, and to coverage on tenants' household personal property in a residential unit, if such coverage is written under one of the following:

Commercial Property Coverage Part

Farm Coverage Part – Farm Property – Farm Dwellings, Appurtenant Structures And Household Personal Property Coverage Form

a. If such coverage has been in effect for 60 days or less, and is not a renewal of coverage we previously issued, we may cancel this coverage for any reason, except as provided in **b.** and **c.** below.

b. We may not cancel this policy solely because the first Named Insured has:

(1) Accepted an offer of earthquake coverage; or

(2) Cancelled or did not renew a policy issued by the California Earthquake Authority (CEA) that included an earthquake policy premium surcharge.

However, we shall cancel this policy if the first Named Insured has accepted a new or renewal policy issued by the CEA that includes an earthquake policy premium surcharge but fails to pay the earthquake policy premium surcharge authorized by the CEA.

c. We may not cancel such coverage solely because corrosive soil conditions exist on the premises. This restriction **(c.)** applies only if coverage is subject to one of the following, which exclude loss or damage caused by or resulting from corrosive soil conditions:

(1) Commercial Property Coverage Part – Causes Of Loss – Special Form; or

(2) Farm Coverage Part – Causes Of Loss Form – Farm Property, Paragraph **D.** Covered Causes Of Loss – Special.

© Insurance Services Office, Inc., 2012

C. The following is added and supersedes any provisions to the contrary:

Nonrenewal

1. Subject to the provisions of Paragraphs C.2. and C.3. below, if we elect not to renew this policy, we will mail or deliver written notice, stating the reason for nonrenewal, to the first Named Insured shown in the Declarations, and to the producer of record, at least 60 days, but not more than 120 days, before the expiration or anniversary date.

   We will mail or deliver our notice to the first Named Insured, and to the producer of record, at the mailing address shown in the policy.

2. **Residential Property**

   This provision applies to coverage on real property used predominantly for residential purposes and consisting of not more than four dwelling units, and to coverage on tenants' household property contained in a residential unit, if such coverage is written under one of the following:

   Commercial Property Coverage Part

   Farm Coverage Part – Farm Property – Farm Dwellings, Appurtenant Structures And Household Personal Property Coverage Form

   a. We may elect not to renew such coverage for any reason, except as provided in b., c. and d. below.

   b. We will not refuse to renew such coverage solely because the first Named Insured has accepted an offer of earthquake coverage.

      However, the following applies only to insurers who are associate participating insurers as established by Cal. Ins. Code Section 10089.16. We may elect not to renew such coverage after the first Named Insured has accepted an offer of earthquake coverage, if one or more of the following reasons applies:

      (1) The nonrenewal is based on sound underwriting principles that relate to the coverages provided by this policy and that are consistent with the approved rating plan and related documents filed with the Department of Insurance as required by existing law;

      (2) The Commissioner of Insurance finds that the exposure to potential losses will threaten our solvency or place us in a hazardous condition. A hazardous condition includes, but is not limited to, a condition in which we make claims payments for losses resulting from an earthquake that occurred within the preceding two years and that required a reduction in policyholder surplus of at least 25% for payment of those claims; or

      (3) We have:

         (a) Lost or experienced a substantial reduction in the availability or scope of reinsurance coverage; or

         (b) Experienced a substantial increase in the premium charged for reinsurance coverage of our residential property insurance policies; and

      the Commissioner has approved a plan for the nonrenewals that is fair and equitable, and that is responsive to the changes in our reinsurance position.

   c. We will not refuse to renew such coverage solely because the first Named Insured has cancelled or did not renew a policy, issued by the California Earthquake Authority, that included an earthquake policy premium surcharge.

   d. We will not refuse to renew such coverage solely because corrosive soil conditions exist on the premises. This restriction (d.) applies only if coverage is subject to one of the following, which exclude loss or damage caused by or resulting from corrosive soil conditions:

      (1) Commercial Property Coverage Part – Causes Of Loss – Special Form; or

      (2) Farm Coverage Part – Causes Of Loss Form – Farm Property, Paragraph D. Covered Causes Of Loss – Special.

3. We are not required to send notice of nonrenewal in the following situations:

   a. If the transfer or renewal of a policy, without any changes in terms, conditions or rates, is between us and a member of our insurance group.

© Insurance Services Office, Inc., 2012

b. If the policy has been extended for 90 days or less, provided that notice has been given in accordance with Paragraph **C.1.**

c. If you have obtained replacement coverage, or if the first Named Insured has agreed, in writing, within 60 days of the termination of the policy, to obtain that coverage.

d. If the policy is for a period of no more than 60 days and you are notified at the time of issuance that it will not be renewed.

e. If the first Named Insured requests a change in the terms or conditions or risks covered by the policy within 60 days of the end of the policy period.

f. If we have made a written offer to the first Named Insured, in accordance with the timeframes shown in Paragraph **C.1.**, to renew the policy under changed terms or conditions or at an increased premium rate, when the increase exceeds 25%.

WAIVER OF OUR RIGHT TO RECOVER FROM OTHERS ENDORSEMENT - CALIFORNIA

We have the right to recover our payments from anyone liable for an injury covered by this policy. We will not enforce our right against the person or organization named in the Schedule. (This agreement applies only to the extent that you perform work under a written contract that requires you to obtain this agreement from us.)

You must maintain payroll records accurately segregating the remuneration of your employees while engaged in the work described in the Schedule.

The additional premium for this endorsement shall be 0 % of the California workers' compensation premium otherwise due on such remuneration.

CALIFORNIA CANCELATION ENDORSEMENT

This endorsement applies only to the insurance provided by the policy because California is shown in Item 3.A. of the INFORMATION PAGE.

The cancelation condition in Part Six (Conditions) of the policy is replaced by these conditions:

CANCELATION

1. You may cancel this policy. You must mail or deliver advance written notice to us stating when the cancelation is to take effect.

2. We may cancel this policy for one or more of the following reasons:

   a. Non-payment of premium;

   b. Failure to report payroll;

   c. Failure to permit us to audit payroll as required by the terms of this policy or of a previous policy issued by us;

   d. Failure to pay any additional premium resulting from an audit of payroll required by the terms of this policy or any previous policy issued by us;

   e. Material misrepresentation made by you or your agent;

   f. Failure to cooperate with us in the investigation of a claim;

   g. Failure to comply with Federal or State safety orders;

   h. Failure to comply with written recommendations of our designated loss control representatives;

   i. The occurrence of a material change in the ownership of your business;

   j. The occurrence of any change in your business or operations that materially increases the hazard for frequency or severity of loss;

   k. The occurrence of any change in your business or operation that requires additional or different classification for premium calculation;

From the WCIRB's California Workers' Compensation Insurance Forms Manual Copyright 1999.

INSURED COPY

l. The occurrence of any change in your business or operation which contemplates an activity excluded by our reinsurance treaties.

3 If we cancel your policy for any of the reasons listed in (a) through (f), we will give you 10 days advance written notice, stating when the cancelation is to take effect. Mailing that notice to you at your mailing address shown in Item 1 of the Information Page will be sufficient to prove notice. If we cancel your policy for any of the reasons listed in Items (g) through (l), we will give you 30 days advance written notice; however, we agree that in the event of cancelation and reissuance of a policy effective upon a material change in ownership or operations, notice will not be provided.

4. The policy period will end on the day and hour stated in the cancelation notice.

INSURED COPY

No action shall be taken against us with respect to Coverage A unless, as a condition precedent thereto, you shall have fully complied with all the terms of this Policy, and until the amount the **Responsible Entity** is legally obligated to pay shall have been finally determined either by judgment after actual contested trial or arbitration, or other method of dispute resolution for which we have given prior written approval.

No action shall be taken against us with respect to Coverage B, C, D or E unless, as a condition precedent thereto, you shall have fully complied with all the terms of this Policy, and until the amount you are legally obligated to pay shall have been finally determined either by judgment after actual contested trial or arbitration, or other method of dispute resolution for which we have given prior written approval.

No person or organization shall have any right under this Policy to join us in any action against you. No **Responsible Entity** shall be an **Insured** under this Policy.

F. Assignment of Interest

It is agreed that the insurance provided herein and your interests hereunder cannot be transferred or assigned to another party without our express written consent.

G. Cancellation and Termination

1. The premium paid for this Policy shall be fully earned in the first twelve months of the **Policy Period**.

2. This Policy may only be cancelled by us for one or more of the following reasons:

   a. non-payment of premium; or
   b. a material misrepresentation or concealment of facts; or
   c. a material breach of any provision of this Policy.

   If this Policy is cancelled by us, notice of cancellation will be sent in writing to you, at the address indicated on the Declarations. We will provide such written notice at least ninety (90) days prior to the date such cancellation is to take effect; except that, in the event of cancellation for non-payment of premium, we will provide only fifteen (15) days written notice. If the premium is paid by a premium financing company and the premium financing company, acting under a valid premium finance agreement with you, requests cancellation of the Policy due to non-payment of premium from you in the first twelve (12) months of the **Policy Period**, the earned premium shall be computed short-rate of the twelve-month earned policy term premium and returned to the premium finance company.

   The effective date and hour of cancellation will be stated in such notice. Cancellation by us also cancels the Automatic Extended Reporting Period and any Optional Extended Reporting Period; the **Policy Period**, the Automatic Extended Reporting Period, and any Optional Extended Reporting Period will end on that date. If we cancel for the reason specified in Subparagraph (a), there shall be no return premium. If we cancel for reasons stated in Subparagraphs (b) or (c) in the first twelve (12) months of the **Policy Period**, the earned premium shall be computed pro-rata of the twelve-month earned policy term premium. Payment of any return premium shall not be a condition of cancellation.

3. This Policy may be cancelled by the first **Named Insured** for any reason. In the event that the first **Named Insured** cancels the Policy, the earned premium shall be computed under the customary short rate table and procedure as a percentage of the total Policy premium stated in the Declarations, and we will return the earned premium to the first **Named Insured**. Cancellation by the first Named Insured shall also cancel the Automatic Extended Reporting Period and any Optional Extended Reporting Period on the date of cancellation.

4. Notwithstanding the foregoing, if you report a **Claim** or **First Party Claim** to us prior to the

COUNCIL COMMUNICATION

CC #: 1527
File #: 0800-04 & 0201-01

Title:	Local Road Safety Plan - Professional Services Agreement Amendment and Budget Adjustment
Contact:	Heather Chan 916-746-1300 hcchan@roseville.ca.us

Meeting Date: 6/16/2021
Item #: 7.29.

RECOMMENDATION TO COUNCIL

Staff recommends the City Council:

1) Adopt a resolution to authorize the City Manager to execute the First Amendment to Professional Services Agreement with Kimley-Horn and Associates for continued development of the Local Road Safety Plan, and
2) Adopt an ordinance to approve a budget adjustment in the amount of $61,000 for the continuing development of a Local Road Safety Plan for the City of Roseville.

BACKGROUND

In the April 15, 2020 meeting, Council approved a budget adjustment for the initial development of the Local Road Safety Plan (LRSP). Subsequently, Caltrans allocated additional funding for LRSP development to the City based on a revised grant criteria associated with the City's total lane miles. Staff was successful in obtaining $47,700 in additional grant funding for the continued development of the City's LRSP through the Highway Safety Improvement Program (HSIP).

The LRSP will provide the framework for local stakeholders to identify, analyze, and prioritize roadway safety improvements within the City. The plan will identify goals, objectives, and strategies to reduce collisions focusing most importantly on reducing fatalities and the most serious injury collisions. In addition, the LRSP will soon be a requirement for several state and federal transportation safety grant applications the City may want to pursue for various transportation projects in the future.

The recommended budget adjustment is needed to budget the $47,700 additional state grant funds for the project and to provide $13,300 in matching funds from the Highway User Tax Fund.

In the August 5, 2020 meeting, Council approved a Professional Services Agreement with Kimley-Horn and Associates for the initial development of the LRSP. With the additional funding received, staff identified additional and/or expanded scope of work to address within the City's

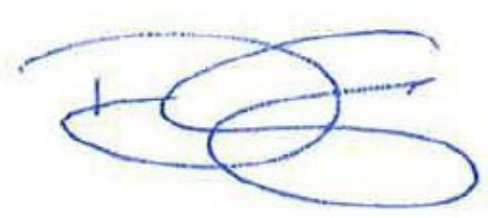
LRSP including preparation of additional diagrams, additional crash data analysis, project development and grant identification and application assistance. The revised scope of work for Kimley-Horn necessitates a contract amendment in an amount not to exceed $52,684.66, bringing their total compensation for the LRSP to $132,566.95.

FISCAL IMPACT

The City's Local Road Safety Plan project is estimated to cost $151,000 in staff time and professional services. At the April 15, 2020 meeting, Council approved a budget adjustment for $90,000 ($72,000 of which was grant funding, and $18,000 of which was Highway User Tax funding). The recommended budget adjustment will appropriate an additional $61,000 to the project, with $47,700 of grant funds and $13,300 of Highway User Tax funding. No General Fund resources will be used for the project.

ENVIRONMENTAL REVIEW

The California Environmental Quality Act (CEQA) does not apply to activities that will not result in a direct or reasonably foreseeable indirect physical change in the environment, or is otherwise not considered a project as defined by CEQA Statute §21065 and CEQA State Guidelines §15060(c)(3) and §15378. Approval of the City's Local Road Safety Plan and budget adjustment meets the above criteria and is not subject to CEQA. No additional environmental review is required.



CITY COUNCIL STRATEGIC PLAN/OVERARCHING GOALS

Goal C - Maintain a safe and healthy community
Goal E - Deliver exceptional city services
Goal F - Invest in well-planned infrastructure and growth

Resolution 21-262

Amendment to Professional Services Agreement

Ordinance 6374

Budget Adjustment

RESOLUTION NO. 21-262

APPROVING A FIRST AMENDMENT TO PROFESSIONAL SERVICES AGREEMENT, BY AND BETWEEN THE CITY OF ROSEVILLE AND KIMLEY-HORN AND ASSOCIATES, INC., AND AUTHORIZING THE CITY MANAGER TO EXECUTE IT ON BEHALF OF THE CITY OF ROSEVILLE

WHEREAS, a first amendment to professional services agreement for continuing the development of a Local Road Safety Plan, by and between the City of Roseville and Kimley-Horn and Associates, Inc., has been reviewed by the City Council; and

NOW, THEREFORE, BE IT RESOLVED by the Council of the City of Roseville that said first amendment is hereby approved and that the City Manager is authorized to execute it on behalf of the City of Roseville.

PASSED AND ADOPTED by the Council of the City of Roseville this____day of _____, 20_, by the following vote on roll call:

FIRST AMENDMENT TO

PROFESSIONAL SERVICES AGREEMENT

Local Road Safety Plan

THIS FIRST AMENDMENT TO AGREEMENT is made and entered into this ___ day of _____, 20__, by and between the City of Roseville, a municipal corporation ("CITY"), and Kimley-Horn and Associates, Inc., a North Carolina corporation ("CONSULTANT"); and

W I T N E S S E T H:

WHEREAS, CITY and CONSULTANT previously entered into a Professional Services Agreement dated August 5, 2020 ("Agreement") regarding a local road safety plan for the City of Roseville ("Project"); and

WHEREAS, CITY desires to amend the Agreement to include additional services as described in CONSULTANT's letter/proposal, which is attached hereto as Exhibit "A" and incorporated herein by reference; and

WHEREAS, CONSULTANT is willing and able to provide such additional services.

NOW, THEREFORE, the parties agree as follows:

1. CONSULTANT shall provide additional services as described in Exhibit "A" of this First Amendment to Agreement.

2. Section 2 of the Agreement is amended by adding an additional paragraph to read as follows:

"CITY shall pay fifty-two thousand, six hundred eighty-four dollars, and sixty-six cents ($52,684.66), in consideration of the additional services as set forth in Exhibit "A" to the First Amendment to Agreement. This brings the total not to exceed contract amount to one hundred thirty-two thousand, five hundred sixty-six dollars, and ninety-five cents ($132,566.95)."

3. All other provisions of the Agreement shall remain unchanged and in full force and effect.

IN WITNESS WHEREOF, the City of Roseville, a municipal corporation, has authorized the execution of this First Amendment to Agreement in duplicate by its City Manager and attested to by its City Clerk under the authority of Resolution No. _____, adopted by the Council of the City of Roseville on the ___ day of _____, 20__, and CONSULTANT has caused this First Amendment to Agreement to be executed.

EXHIBIT "A"

Roseville LRSP Amendment #1

Background

In late 2020, Caltrans modified the amount of grant funding that agencies could receive to complete their LRSP. The City of Roseville applied for and received additional funding from Caltrans for their LRSP as a result of the new funding requirements established. The purpose of this Amendment is to increase the scope of the LRSP for Roseville to account for the additional funding received.

Task 11.0 Project Management

This task includes general project administration, including management of project staff and accounting over the extended duration of the project. This task also includes additional ongoing coordination with the City to discuss project progress and key milestones.

Task 12.0 Field Review

Kimley-Horn will conduct the field review at an additional five locations for a total of ten locations. Notes will be prepared at the additional five locations, and Kimley-Horn will work with Roseville to narrow the list of projects down to seven. (Previous scope included five.)

Task 13.0 Collision Diagrams

Kimley-Horn will prepare collision diagrams for up to seven locations. The locations will be determined in coordination with the City.

Task 14.0 Additional Crash Data Analysis

Kimley-Horn will conduct crash data analysis in addition to the crash data analysis conducted and included in the Roseville LRSP Safety Analysis Technical Memorandum (dated January 2021). Additional crash data analysis could include additional maps, tables, collision diagrams, answering specific questions on crashes at specific intersections, etc. Twenty-five hours are included under this task.

Task 15.0 Develop Projects

Kimley-Horn will develop two additional projects for up to seven total projects (this includes the five projects from the base scope). Kimley-Horn will also look at the intersection of Vernon and Atlantic to determine if a project should be identified at this location. Kimley-Horn will review the previous HSIP application for this location.

Task 16.0 Incorporate Additional Findings into LRSP

The additional information will be incorporated into the LRSP prepared under the base scope of services.

Task 17.0 HSIP Grant Application Information

HSIP Cycle 11 is expected to be released in 2022, and the application is not currently available. Kimley-Horn will utilize the previous HSIP Cycle 10 application to prepare materials in support of a future grant application to be completed by the City after the LRSP is completed. Kimley-Horn will work with the City to determine which project will receive documentation for a future grant application. The following

information will be included in the documentation provided to the City for use in the HSIP Cycle 11 application:

- Project Identification (5,000 characters or less)
- Prior Attempts to Address the Safety Issues (5,000 characters or less)
- Other Comments (5,000 characters or less)
- Engineer's Checklist
- Vicinity Map/Location Map
- Project Map Showing Existing and Proposed Conditions (Planning Level)
- Pictures of Existing Condition
- HSIP Analyzer
- Collision Diagram
- Collision List

If the selected location includes work on the State Highway System, the City will be responsible for coordination with Caltrans or other required parties.

ORDINANCE NO. 6374

ORDINANCE OF THE COUNCIL OF THE CITY OF ROSEVILLE AUTHORIZING CERTAIN AMENDMENTS TO THE FISCAL YEAR 2020-21 BUDGET AND DECLARING THIS ORDINANCE TO BE IMMEDIATELY EFFECTIVE AS AN APPROPRIATION MEASURE

THE CITY OF ROSEVILLE ORDAINS:

SECTION 1. The City of Roseville Annual Budget, Fiscal Year 2020-21, is hereby amended as listed on the attached budget adjustment for continuing the development of a Local Road Safety Plan.

SECTION 2. This ordinance is hereby declared to be an appropriation measure, immediately effective pursuant to the provisions of Section 5.03 of the Charter.

SECTION 3. The City Clerk is hereby authorized and directed to post a true copy of the foregoing ordinance in each of three (3) conspicuous locations in the City and she shall immediately after such posting enter in the ordinance book, under the record of the ordinance, a certificate under her hand stating the time and place of such publication by posting.

PASSED AND ADOPTED by the Council of the City of Roseville, this _____ day of _____, 2021, by the following vote on roll call:

ACCOUNT STRING				BUDGET ($)	DESCRIPTION
Fund	Account	Center	Project	Adjustment	
2305	3601	00000	000000	(13,300)	Reduce Highway User Tax Fund Balance
			TOTAL	(13,300)	

Justification for Budget Adjustment:

This $61,000 budget adjustment is requested to continue the development of a Local Road Safety Plan (LRSP) which will soon be a requirement by Caltrans to apply for transportation safety grants. A previous budget adjustment (in the amount of $90,000) was approved in April 2020 for the initial development of the LRSP. Caltrans has allocated additional funding to the City of Roseville based on a revised criteria for the Grant; $47,700 is reimbursable from a Caltrans Grant and the remaining $13,300 will come from Highway Users Tax (HUT) fund balance.

Title:	Dry Creek Wastewater Treatment Plant Cogeneration Project - Budget Adjustment
Contact:	Todd Jordan 916-746-1829 tjordan@roseville.ca.us

Meeting Date: 6/16/2021
Item #: 7.30.

RECOMMENDATION TO COUNCIL

Staff recommends that the City Council adopt an ordinance approving the attached budget adjustment to cover costs for City staff labor on the Dry Creek Wastewater Treatment Plant Cogeneration Project.

BACKGROUND

The Dry Creek Wastewater Treatment Plant Cogeneration Project (400109) is complete but currently has a balance of $239,367.32 due to higher than anticipated City staff labor expenses. Staff utilized the design-assist project delivery method which promotes collaboration between project contractors and City staff. Environmental Utilities staff completed the construction of pipeline improvements and associated asphalt repairs due to such construction. These improvements were a result of plant staff collaborating with the contractor on repairing unforeseen issues with pipeline conflicts on the project.

In order to close the project by the end of FY2021, staff recommends increasing the project budget by $239,368.

FISCAL IMPACT

Approval of the attached budget adjustment authorizes an additional $239,368 in funding from the Wastewater Rehabilitation Fund (reducing that fund's available resources), increasing the total project budget to $10,143,725.

ENVIRONMENTAL REVIEW

The California Environmental Quality Act (CEQA) does not apply to activities that will not result in a direct or reasonably foreseeable indirect physical change in the environment, or is otherwise not considered a project as defined by CEQA Statute §21065 and CEQA State Guidelines

§15060(c)(3) and §15378. Approval of a budget adjustment meets the above criteria and is not subject to CEQA. No additional environmental review is required.

ORDINANCE NO. 6376

ORDINANCE OF THE COUNCIL OF THE CITY OF ROSEVILLE AMENDING SECTION 14.24.079 OF CHAPTER 14.24 OF TITLE 14 OF THE ROSEVILLE MUNICIPAL CODE REGARDING LOW INCOME RATE REDUCTION

THE CITY OF ROSEVILLE ORDAINS:

SECTION 1. Section 14.24.079 of Chapter 14.24 of Title 14 of the Roseville Municipal Code is hereby amended to read as follows:

14.24.079 Low-income rate reduction.

A. Effective July 1, 1998, any household with a total income no greater than 200% of the Federal Poverty Level (FPL) issued by the Department of Health and Human Services (HHS) may apply for a 15 percent rate reduction of all charges in the standard residential rate. Applications for reduced rates shall be on forms supplied by the city. All information required to be given on such forms shall be supplied by the applicant on behalf of the household under penalty of perjury.

B. Reduced rates shall be granted to qualifying household which file applications with the director of finance. A change of address terminates the special rate provided in this section, but a new application at a new address may be made and the reduced rate shall be allowed, if the requirements set out in this section are satisfied.

C. For the purposes of this section, a "qualifying household" is defined as any household with a verifiable gross household income no greater than 200% of the Federal Poverty Level (FPL) issued by the Department of Health and Human Services (HHS).

D. This rate reduction replaces the senior citizen rate reduction, Municipal Code Section 14.24.075, for new applicants. Current senior citizen rate reduction participants may choose to remain on the existing senior reduced rate or apply for the low-income rate reduction.

E. No household may participate in more than one city electric rate reduction program concurrently.

SECTION 2. This ordinance shall be effective at the expiration of thirty (30) days from the date of adoption.

SECTION 3. The City Clerk is hereby directed to cause this ordinance to be published in full at least once within fourteen (14) days after it is adopted in a newspaper of general circulation in the City, or shall within fourteen (14) days after its adoption cause this ordinance to be posted in full in at least three (3) public places in the City and enter in the Ordinance Book a certificate stating the time and place of said publication by posting.

COUNCIL COMMUNICATION

CC #: 1523
File #: 0202

Title:	Annual City of Roseville Interest Rate Swaps Report for Fiscal Year 2019-20
Contact:	Nick Rosas 916-774-5314 nrosas@roseville.ca.us

Meeting Date: 6/16/2021
Item #: 7.32.

RECOMMENDATION TO COUNCIL

Staff recommends that Council accept the following informational report on the performance of the City's outstanding interest rate swaps for the Electric Department system debt.

BACKGROUND

In accordance with the City of Roseville Swap Policy, a written report detailing the status of all swaps entered into by the City shall be provided to the City Council on an annual basis.

Starting in 2002, Electric began to diversity its debt portfolio with the use of interest rate swaps. The purpose of these swaps was to reduce debt service cost over fixed rate debt while limiting the unpredictability of variable rate debt. Swaps reduce debt service by taking on additional risks (e.g. basis risk, liquidity renewal risk, and counterparty risk). These instruments are not executed for speculative reasons.

The City makes fixed interest payments to Morgan Stanley in exchange for floating rate interest payments based on the notional amount of the 2008A Electric bonds. In 2012, the 2008A Electric bonds were refunded by the 2012 Electric bonds and the 2012 Electric bonds were purchased by U.S. Bank through a direct purchase agreement. The direct purchase option removed the liquidity banking trading risk, remarketing risk, and any London Inter-Bank Offered Rate (LIBOR) manipulation. In November 2019, the interest rate swap agreement with the Bank of America Merrill Lynch was terminated with a termination payment of $7,176,500, the 2012 Certificates of Participation were paid down $36,000,000, and U.S. Bank renewed the terms of the direct purchase agreement on the remaining balance for another 3.5 year term based on 80% of one-month LIBOR plus 60 basis points (bps).

FISCAL IMPACT

This is an informational item only. As such, there is no fiscal impact.

ENVIRONMENTAL REVIEW

The California Environmental Quality Act (CEQA) does not apply to activities that will not result in a direct or reasonably foreseeable indirect physical change in the environment, or is otherwise not considered a project as defined by CEQA Statute §21065 and CEQA State Guidelines §15060(c)(3) and §15378. The informational report meets the above criteria and is not subject to CEQA. No additional environmental review is required.

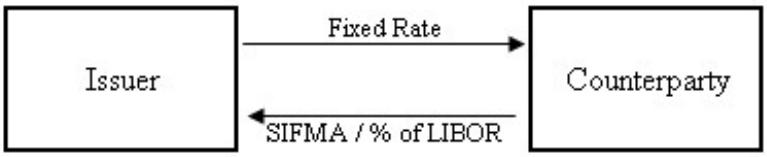
Description

Interest Rate Swap Report FY 2020

INTEREST RATE SWAPS REPORT



For the Year Ended June 30, 2020

Prepared by
Nick Rosas
Accounting Manager
City of Roseville

General Information – Interest Rate Swaps

An interest rate swap is a contract between two parties to exchange certain cash flows for a defined period of time related to an underlying asset or liability without actually exchanging the underlying principal amount. The computational base on which the swapped payments are calculated is referred to as the "notional amount." Interest rate swaps are used to convert one interest rate basis to a different basis (e.g., from floating to fixed or fixed to floating) and enable bond issuers to accomplish financial goals such as hedging variable rate exposure, improving asset/liability matches or reducing borrowing costs.

In the municipal marketplace, the two parties to a swap are called "counterparties" and consist of an agency, such as the City of Roseville, and a financial institution. The counterparties exchange interest payments on specific dates according to a predetermined formula. Only the net payment amount is exchanged. The floating rate resets are generally based on the LIBOR[1] or SIFMA[2] index.

Swap Risks

1. Basis Risk: (1) the degree to which the difference between two prices fluctuates; (2) the residual risk that remains after a hedge has been placed; (3) the risk from receiving one floating rate, such as SIFMA and paying another, such as the interest rate on your own obligations.

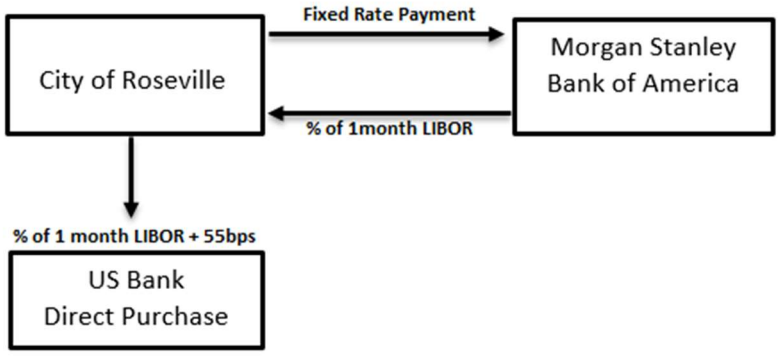
2. Counterparty Risk: The risk that the party on the other side of a swap transaction does not fulfill its obligations under the swap.

3. Rollover Risk: Rollover risk occurs when the term of the swap does not match the term of the asset or liability that the swap is intended to hedge.

4. Tax Risk: Tax risk arises since SIFMA is a tax-exempt index whereas LIBOR is a taxable index, implying that the ratio of SIFMA to LIBOR should approximately be 1-Marginal tax rate. As tax rates increase, SIFMA as a percent of LIBOR should decrease, whereas if tax rates decrease, the reverse would theoretically hold true. Historically the ratio has averaged at approximately 67% of 1-Month LIBOR. Simply stated, basis/tax law risk is the risk of a change in the SIFMA/LIBOR ratio.

5. Termination Risk: During the term of the swap either party may decide to terminate the swap or some contractual provisions may require the swap to be terminated. Unless the swap is at the market, upon termination one of the parties will need to make a termination payment depending upon market interest rates relative to the swap fixed rate. If market rates are higher than the swap fixed rate the party receiving the fixed rate will need to make the termination payment and vice versa.

[1] London Interbank Offered Rate (LIBOR) is a daily reference rate based on the interest rates at which banks offer to lend unsecured funds to other banks. LIBOR is currently scheduled to be phased out of use by the end of 2021. An interest rate swap that relies on LIBOR as a basis for rate calculation will need to seek a replacement rate index in accordance with the swap agreement.
[2] The Securities Industry and Financial Markets Association (SIFMA) Municipal Swap Index is a 7-day high-grade market index comprised of tax-exempt VRDOs.



City of Roseville Interest Rate Swaps

The City's exposure to Electric System variable rate debt has been hedged through an interest rate swap.

Structure of the City's Interest Rate Swaps Related to the 2012 Electric System Revenue Refunding Certificates of Participation

The City has an interest rate swap with Morgan (counterparty) that is structured as a *floating-to-fixed rate* swap. These swaps are based on the notional amount of the 2008A Electric System Revenue Refunding COPs (2008A COPs). The City makes fixed interest payments to the counterparties in exchange for floating rate interest payments (SIFMA or percent of LIBOR) made by the counterparties. A floating-to-fixed rate swap enables the City to structure a synthetic fixed rate liability.

The 2008A COPs were refunded by the 2012 Electric System Revenue Refunding Certificates of Participation (2012 COPs) and the 2012 COPs were purchased by U.S. Bank through a direct purchase agreement.

Background

Due to the liquidity crunch in early 2008, the auction-rate market began to fail. The City took quick action to resolve the high reset rates and downgrade of the bond insurer (FGIC) by terminating the 2005 Electric swap and refunding the outstanding par. On May 13, 2008 the City issued the 2008 Electric System Revenue Certificates of Participation Series A (2008A COPs) and Series B (2008B COPs) in the original principal amounts of $90,000,000 and $64,500,000 respectively, to defease the 2005 Electric COPs Series B and C.

The 2008A COPs were issued as variable rate securities (VRDOs) with interest calculated weekly. The rate fluctuated according to the market conditions but was capped at 12%. The City entered into a 27-year interest rate swap agreement with Morgan Stanley (60%) and Bank of America (40%) for the entire amount of the 2008A COPs. The combination of the variable rate 2008A COPs and a floating-to-fixed rate swap creates a synthetic fixed rate debt for the City.

In November 2012 the 2008A COPs were refunded by the 2012 Electric System Revenue Refunding Certificates of Participation (2012 COPs) and the 2012 COPs were purchased by U.S. Bank through a direct purchase agreement. The direct purchase agreement acts similar to a loan and was analyzed as the most cost effective option regarding the refunding of the 2008A COPs. The direct purchase option removed the liquidity bank trading risk, remarketing risk, and any LIBOR manipulation. Risks associated with the viability of a Letter of Credit provider are essentially removed. U.S. Bank offered a 3.5 year term based on 70.5% of one-month LIBOR plus 62.5 basis points (bps).

In May 2016 U.S. Bank renewed the terms of the direct purchase agreement with a 3.5 year term based on 70.5% of one-month LIBOR plus 55 bps.

On November 1, 2019 the City paid down $36,000,000 of the outstanding 2012 COPs, terminated the interest rate swap agreement with Bank of America for a cost of $7,176,500, and renewed the U.S. Bank direct placement for the remaining $54,000,000 at an interest rate of 80% of one-month LIBOR plus 60 basis points. The Morgan Stanley interest rate swap agreement remains in effect.

Interest Rate Swaps Related to the 2012 Electric System Revenue Refunding Certificates of Participation

Annual Reporting Requirements

Description	
Original notional amount - Total	$90,000,000

Fiscal Impact

The following chart details the 2008A COPs and 2012 Direct Purchase Bonds savings when compared to a conventional fixed rate issue. For the year ended June 30, 2020 the 2008A/2012 bonds had savings of $544,682 and have achieved total savings of over $12.5 million compared to a conventional fixed rate issue.

June 30th	Planned 2008 Debt Service	Conventional Fixed Debt Service	Planned Savings	Actual 2008 Debt Service	Actual Savings
2006	$ 3,217,723	$ 4,098,280	$ 880,557	$ 3,082,768	$ 1,015,512
2007	3,480,935	4,457,344	976,409	3,033,424	1,423,920
2008	3,439,643	4,321,714	882,072	4,206,828	114,887
2009	3,557,232	4,517,335	960,103	4,604,131	(86,796)
2010	3,628,393	4,517,335	888,942	3,774,816	742,519
2011	3,628,393	4,517,335	888,942	3,782,223	735,112
2012	3,629,892	4,517,335	887,443	3,924,644	592,691

2015	3,628,393	4,517,335	977,044	3,422,447	1,094,888
2016	3,629,892	4,517,335	972,599	3,425,498	1,091,837
2017	3,628,374	4,517,335	977,679	3,483,903	1,033,432
2018	3,628,393	4,517,335	976,409	3,485,797	1,031,538
2019	3,628,393	4,517,335	977,044	3,499,961	1,017,374
2020	2,177,935	2,710,401	532,466	2,617,453	92,948
	$ 52,160,359	**$ 65,278,424**	**$ 13,555,610**	**$ 53,196,379**	**$ 12,082,045**

Actual savings to date	**$ 12,082,045**
Actual versus planned savings variance to date	**$ (1,036,021)**
Actual versus planned savings - percent of savings	**89.13%**

Notes

- Savings carried over from 2005 bond issue
- Price date of 5/13/2008
- Fixed swap rate of 3.321% ($54M) and 3.364% ($36M) (70.5% of 1-month LIBOR)
- Assumption that Electric variable rate securities trade at 70.5% of LIBOR (no trading differential)
- Conventional fixed rate estimated as of 5/13/2008 (arbitrage yield of 4.80%)

COUNCIL COMMUNICATION

CC #: 1529
File #: 0721-05

Title:	Mahany Park Open Space Multi-Use Trail Feasibility Study
Contact:	Jeannie Gandler 916-746-1289 jgandler@roseville.ca.us

Meeting Date: 6/16/2021
Item #: 7.33.

RECOMMENDATION TO COUNCIL

The Transportation Commission recommends that the City Council:

1. Accept the Mahany Open Space Multi-Use Trail Feasibility Study; and,
2. Direct staff to pursue funding for environmental review, project engineering and trail construction.

BACKGROUND

The Mahany Park Open Space Multi-Use Trail Feasibility Study has been prepared to evaluate the feasibility for paved Class I trails in the approximately 133-acre Mahany Park Open Space Study Area that is located in western Roseville between Fiddyment Road and Woodcreek Oaks Boulevard, south of Pleasant Grove Boulevard. The study area is adjacent to Mahany Park, the Roseville Aquatics Complex, and Woodcreek High School on the east and bounded by residential development on the north and south.

Paved trails are planned for the Study Area in the General Plan, the Roseville Open Space Overarching Management Plan (OSOMP), the City of Roseville Bicycle Master Plan (BMP) and adjacent Specific Plans. This study refines the trail alignments previously identified in the above documents. Please see the attached Transportation Commission staff report for more background information.

Public Engagement
A robust public engagement process was developed to inform the public about the study. Consistent with COVID-19 precautions and public health guidelines, the public engagement process included:

- A project website created and updated frequently by City staff.
- An informational video about the project.
- Two interactive online surveys (instead of in-person workshops).
    - The first survey informed the public about the study and gathered information about how people currently use the open space, and how they would like to use the open space. The survey results contributed to development of trail alignment options.

- The second survey presented and requested public feedback on trail alignment alternatives.

The above engagement opportunities were shared with the public using a variety of outreach methods as described in the Transportation Commission staff report.

Trail Alignment Options
The planning process started with a thorough existing conditions assessment and opportunities and constraints analysis. This process included reviewing existing planning documents, field walks, a Biological Constraints Report, consultation with utilities and regulatory agencies, phone interviews with stakeholders including Woodcreek High School biology and extra-curricular program teachers, and comments obtained through the first online survey.

The project team then developed trail alignment options for the study area. To simplify the presentation of the trail alignment options, the Study Area was split into east and west sections. Three trail alignment options were developed for the western half of the Study Area and two trail alignment options were developed for the eastern half of the Study Area. Any of the western trail alignment options would connect with either of the eastern trail alignments. The trail alignment options were presented to the public as part of the second online survey.

Recommended Trail Alignment
After reviewing the project goals and the results of the second online survey, the project team developed a recommended trail alignment. The recommended alignment proposes approximately 2.4 miles of new trail through the Study Area that would:

- Close gaps in the Class I trail and bikeway system resulting in connections to surrounding neighborhoods, schools, parks, transit stops, roads and businesses, for safe use by people of all ages, abilities and incomes;
- Provide permanent, all-weather crossings of creeks in the Study Area to allow safe use year-round;
- Provide varying lengths of recreational loop opportunities;
- Protect natural resources, including vernal pool habitat;
- Maintain required access for existing utilities; and
- Include a variety of amenities along the trail.

The preliminary cost to construct the trail, including a mid-block crossing on Fiddyment Road, ranges from $4.3 million, using standard paving materials, to $6.7 million if permeable materials are used throughout. This cost estimate includes all of the remaining steps to complete the project, which include traffic studies for a potential mid-block crossing of Fiddyment Road, geotechnical studies, additional studies required by regulatory agencies, preliminary engineering, environmental reviews, permitting, final design, and construction.

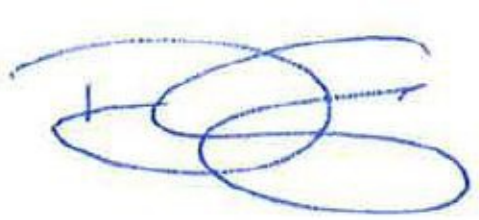
Parks, Recreation & Libraries Commission and Transportation Commission Review
The study, including the recommended trail alignment, was presented to the Parks, Recreation and Libraries Commission and the Transportation Commission at their May 3, 2021 and May 18, 2021 meetings, respectively. No formal action was sought from the Parks, Recreation and Library Commission, and commissioners commented that the study is well-considered and responsive to the public's needs. The Transportation Commission unanimously recommended the City Council accept the study. Notice of the meetings was provided to the project email list (approximately 1,000 interested persons), the City's Trail Alert email service (approximately 7,000 recipients), the City News email service (approximately 48,000 recipients), the City website and other online and social media platforms. No public comment was received at either meeting.

FISCAL IMPACT

Funding for the next steps of this project have not been identified. At City Council direction, staff will pursue funding through various federal, state, and local sources over the next several years to complete the project. General Fund resources were not used for this study and are not used for multi-use trail construction.

ENVIRONMENTAL REVIEW

The California Environmental Quality Act (CEQA) does not apply to feasibility and planning studies for possible future actions which the agency has not approved or funded (CEQA Guidelines §15262). Because the Mahany Park Open Space Multi-Use Trail Feasibility Study only authorizes feasibility and planning studies it is statutorily exempt from CEQA review. Following completion of these studies the City and/or participating entities will refine the project proposal and conduct CEQA review prior to project approval.



CITY COUNCIL STRATEGIC PLAN/OVERARCHING GOALS

Goal A - Remain fiscally responsible in a changing world
Goal C - Maintain a safe and healthy community
Goal E - Deliver exceptional city services

Respectfully Submitted,

EXECUTIVE SUMMARY

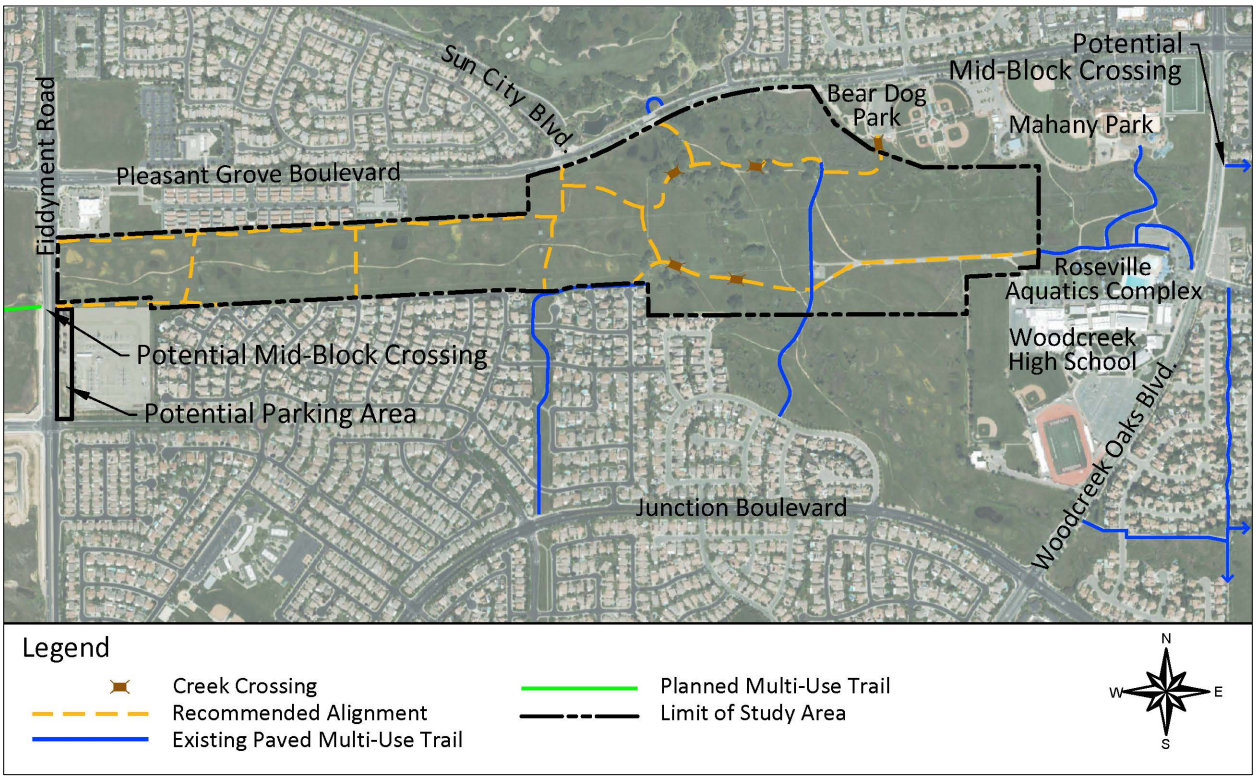
The Mahany Park Open Space Multi-Use Trail Feasibility Study evaluates current conditions and recommends an alignment and cost estimate for a paved, multi-use trail in the Mahany Park open space (see Study Area Map below). A connected, paved trail system would mitigate impacts of current use on sensitive habitats and provide safe, convenient access to the City's multi-use trail network for people of all ages, abilities, and incomes through the study area.

STUDY AREA MAP

The consulting team documented existing conditions in the study area through site surveys, field walks, trail user counts, review of existing documents, meetings with regulatory agency and utility representatives, and used this information to assess opportunities and constraints. A project development team composed of City of Roseville staff and the consulting team was established and met monthly to review and discuss field and technical reports, project updates, existing conditions, public engagement, and potential trail alignments. Technical teams were established as needed to address specific issues, such as educational opportunities, utility access requirements, and regulatory coordination.

A robust public engagement process was developed to inform the public about current conditions and trail user preferences, however, due to COVID-19 precautions and public health guidelines, public engagement components of the study had to be adjusted. A project website (www.roseville.ca.us/mahanytrail) was created, updated frequently by City staff, and includes an informational video. Due to the COVID-19 pandemic, face-to-face workshops were replaced with two interactive online surveys to learn trail user preferences and to present project alignment alternatives

leading to the final recommendation. Communication to encourage public participation included: direct mailers, a feature story on ABC 10, email newsletters, Facebook, Twitter, Instagram, Nextdoor, and signage in the project area.



Constructed vernal pool in the Study Area.

Early in the study process, the consulting team met with regulatory agencies who oversee mitigation measures established when residential construction projects were approved along the southern border of the study area in the early 1990s. At that time, the west half of the Mahany Park Open Space was established as a preserve, and approximately 10 acres of vernal pools were created interspersed with naturally occurring vernal pools. Due to the regulatory history, the presence of these vernal pools and other sensitive resources, including seasonal wetlands, seasonal and perennial creeks, riparian and oak woodland habitat, and the potential for a number of protected species to occur on the site, coordination with the U.S. Fish and Wildlife Service, California Department of Fish and Wildlife, and U.S. Army Corps of Engineers was an important component of this study. Each agency confirmed that the conceptual alignment would be feasible with the appropriate standard permits and agreements.

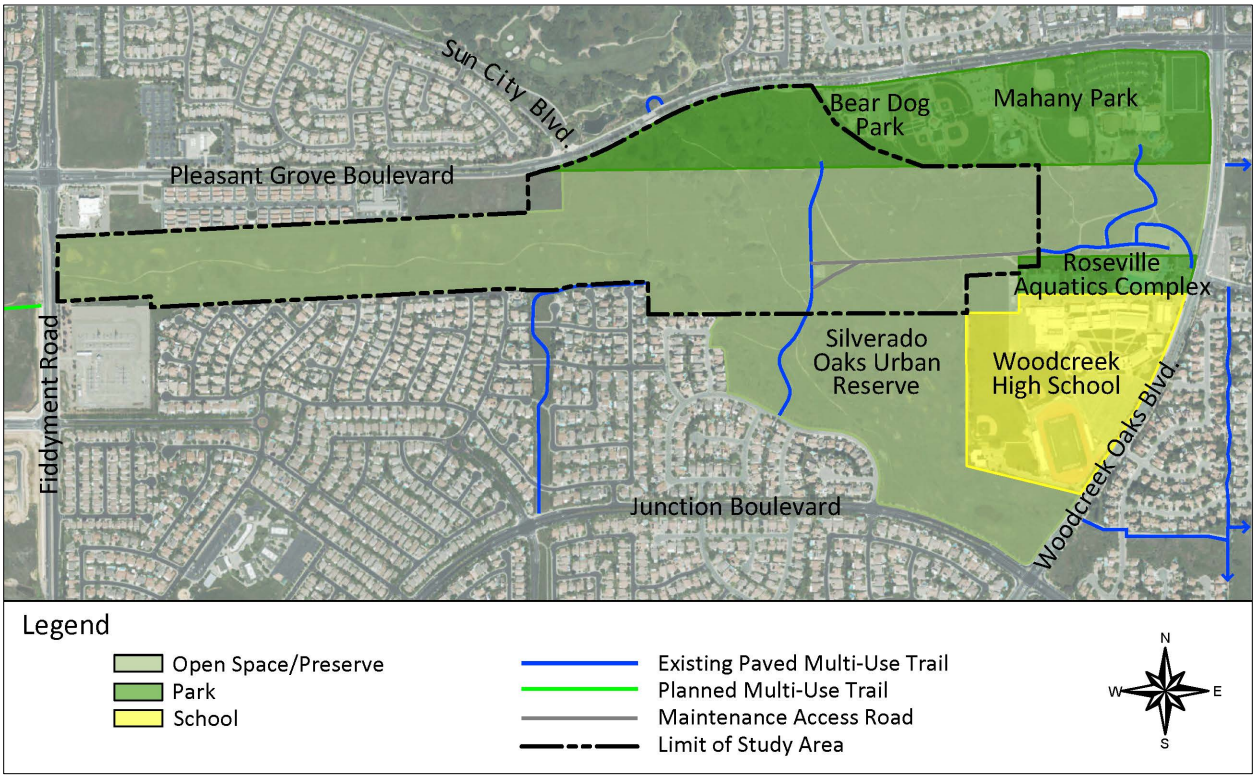
Analysis of existing planning documents, meetings with technical staff, utility companies, regulatory agencies, nearby schools, the Utility Exploration Center, and results from the public engagement components, including two interactive online surveys, led to the recommended alignment shown below. The proposed alignment would result in 2.4 miles of paved trail which provides recreational loops and connects users to all existing and planned trails surrounding the Mahany Park open space.

RECOMMENDED TRAIL ALIGNMENT

When constructed, the proposed trail will allow for year-round use of the area and provide important transportation connections north to south and east to west through the open space by closing gaps in the trail and bikeway system. Adding educational components identifying vernal pools, native plants, and species may help alleviate the impact current usage has had on sensitive habitats and help users understand the importance of staying on paved trails to preserve the protected natural resources in the study area.

The preliminary estimated cost to construct the trail, including a mid-block crossing, on Fiddyment Road, ranges from 4.3 million dollars using standard paving materials to 6.7 million dollars if permeable materials are used throughout. This cost estimate includes all of the remaining steps to complete the project, which include additional traffic studies for a proposed mid-block crossing of Fiddyment Road, geotechnical studies, additional studies required by regulatory agencies, preliminary engineering, environmental reviews, permitting, final design, and construction (see Table 3 in Section 4.7).

User-created dirt paths impact natural resources like this seasonal stream.



Funding for the next steps necessary to construct the recommended trail alignment has not been identified. As directed by City Council, staff will pursue funding through various federal, state, regional and local sources over the next several years to complete the project. General Fund and Measure B funds were not used for this study and are not used for multi-use trail construction.

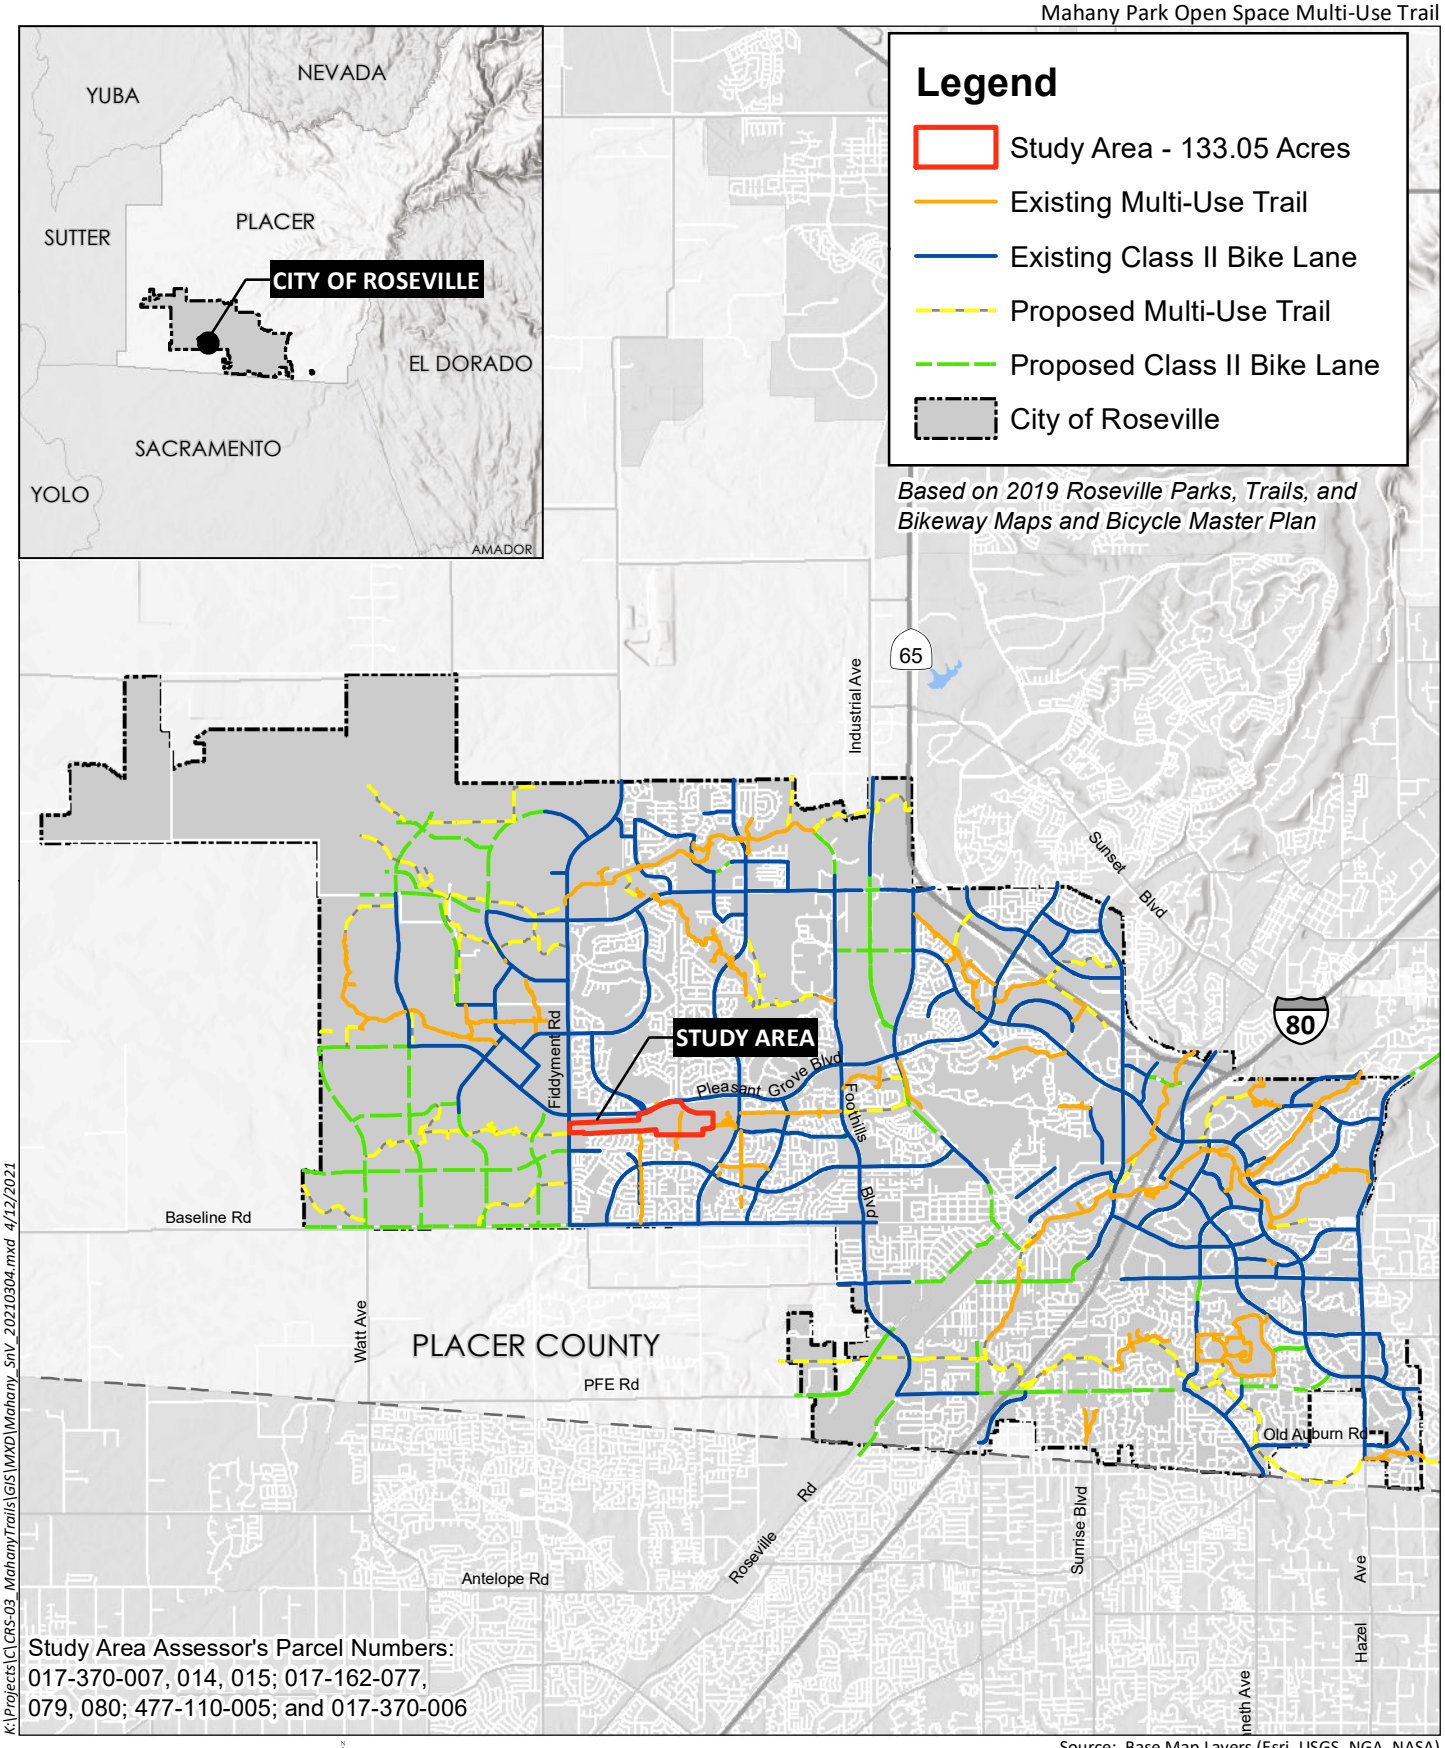
This page intentionally left blank

1.0 INTRODUCTION

The approximately 133-acre Mahany Park Open Space Multi-Use Trail Study Area (Study Area) is located in western Roseville between Fiddyment Road and Woodcreek Oaks Boulevard, south of Pleasant Grove Boulevard (Figure 1). Part of the project area is a public park, but most of the area is designated as an open space preserve. It is adjacent to Mahany Park, the Roseville Aquatics Complex, and Woodcreek High School on the east and bounded by residential development on the north and south. The Silverado Oaks Urban Reserve, another open space preserve, is also located immediately south of the Study Area.

Figure 1
SITE LOCATION AND LAND USE

The purpose of this feasibility study is to explore the potential for a paved multi-use trail through the Mahany Park Open Space, resulting in a conceptual alignment, cost estimates and next steps leading to construction. The Study Area includes open space and open space preserves that were established to protect natural resources, including vernal pools, wetlands, creeks, and oak trees. The area is popular for walking, running, and biking and many user-created dirt paths have been established through the area. A paved, connected trail system through the Mahany Park open space may reduce impacts to natural resources, would provide additional recreational opportunities, and would improve the connectivity of the City's trail system providing more opportunities for active transportation for people of all ages, abilities, and incomes.



A trail through this area has been considered in several previous planning documents, including the Roseville Open Space Preserve Overarching Management Plan, the City of Roseville Bicycle Master Plan, and Specific Plans for developments adjacent to the area. This document refines the trail alignment

previously considered in those documents based on site conditions, public input, information gathered from regulatory, utility, and City agencies, and the input of the City's project development team.

Existing paved trails in the Study Area end suddenly.

The City of Roseville has an extensive trail and bikeway system, which includes over 36 miles of off-street multi-use trails and over 90 miles of Class II bike lanes (Roseville 2021). As shown in Figure 1, paved multi-use trails enter the Study Area at four locations, but there are no complete paved trails through the Study Area. Existing and planned Class I paved, multi-use trails and Class II bike lanes in the City are shown on Figure 2. The recommended alignment would add approximately 2.4 miles of paved, multi-use trails in the Study Area. The proposed trails would close gaps in the existing multi-use trail system by connecting to existing multi-use trails that end at or near the Study Area. When complete, the additional trails would connect Fiddyment Road in the west with Mahany Regional Park, the Roseville Aquatic Center, Woodcreek High School, and ultimately Woodcreek Oaks Boulevard in the east. The additional trails would provide connections between Pleasant Grove Boulevard to the north and the existing multi-use trails that extend through existing neighborhoods to the south.

HELIX Environmental Planning

City Bikeway Network

Figure 2

2.0 BACKGROUND

The initial phase of the project consisted of site assessments and research to identify the opportunities and constraints of the Study Area. The Study Area was surveyed by biologists and arborists to assess and document the existing natural resources that have the potential to limit improvements. Landscape architects assessed the existing use, recreation amenities and infrastructure, demographics of the surrounding community, and school locations and attendance areas to identify community needs, opportunities, and constraints. The consultant and technical teams met with regulatory agencies and utility companies to identify design requirements and confirm the development approval process. The consultant team reviewed existing planning documents including trail design guidelines, specific plans, the City General Plan. Additionally, on-site trail use counts and an extensive public engagement component consisting of two interactive online surveys were used to gather information about existing and desired use patterns, current access points and desired access points, and preferred trail alignments and amenities.

Three alternative alignment options were developed using the opportunities and constraints identified in the Existing Conditions Report and input from City staff. Prior to the second public engagement effort, the alternative alignments were reviewed with environmental regulatory agencies to ensure that they could be permitted in the open space preserve. Following this preliminary environmental review, the alternative alignments were presented for public comment in the second virtual survey.

2.1 EXISTING CONDITIONS REPORT

The Existing Conditions Report documented the existing conditions, identified design opportunities and constraints, and provided a summary of applicable design guidelines (*Mahany Park Open Space Trail Existing Conditions Report* - Appendix A). The Study Area has a well-developed network of informal dirt paths as well as abundant natural resources, including vernal pool complexes in the western half of the site and mature oak trees and creeks in the eastern half of the site, which are shown on Figure 3. Additionally, there are both overhead and underground utilities throughout the Study Area. Opportunities and constraints are discussed in detail in Section 2.1.2 and identified in Figure 4.

Figure 3
EXISTING CONDITIONS

2.1.1 Existing Documents

A number of existing documents are relevant to this project because they include conceptual alignments for a trail through the Study Area or goals and requirements that should be considered during trail design. These documents are discussed in detail in the Existing Conditions Report (Appendix A) and are summarized below:

- The *Roseville Open Space Preserve Overarching Management Plan* (OSPOMP) provides a universal approach and specific goals for open space management, maintenance, and monitoring in all City open space. The OSPOMP replaces individual management plans written for each open space as they were established. It specifically discusses bike trails and related amenities, defines different types of open space management areas, and includes recreation goals and actions related to the installation of trails within the Study Area. The OSPOMP includes a conceptual alignment for a Class I bike trail within the Study Area, and includes goals and recommendations to discourage user-created trails through sensitive habitats, reclaim user-created paths in open space preserves, protect biological resources by discouraging vandalism, and off-leash dogs, and encourage safe trail use (Roseville 2011). Since the majority of the Study Area is an open space preserve established to preserve natural resources, any trail in the area must meet the goals of the OSPOMP.
- The *City of Roseville General Plan* (General Plan) includes Circulation, Open Space and Conservation, and Parks and Recreation Elements which focus on the preservation and enhancement of the open space and trail networks. The General Plan includes planned Class I bikeways crossing through the Study Area both east to west and north to south. The General Plan elements address development of a bikeway network, including through the Study Area, and access to open space areas for recreation and education to the extent possible while preserving and enhancing natural resources (Roseville 2020). Design of a new trail must address the multiple goals of recreation, education, circulation, and preservation of natural resources.
- The *City of Roseville Bicycle Master Plan* (BMP) guides bikeway policies, programs, and development standards within the City of Roseville. The BMP identifies four Class I bikeways that terminate at or in the Study Area and proposes two additional segments of Class I bike trail within the Study Area, consisting of a north-south trail connecting the existing bikeways and an east-west trail from Mahany Park to Fiddyment Road. It also encourages associated support amenities, such as wayfinding signage, trail maps, and mile markers (Roseville 2008). Standards established in the BMP should be incorporated into the trail design.
- The *Del Webb Specific Plan, Northwest Roseville Specific Plan, North Roseville Specific Plan,* and *Sierra Vista Specific Plan* all include portions of, or are adjacent to, the Study Area. Each specific plan has a Circulation Element and all are consistent with General Plan goals for an extensive bikeway network in the City that include connections through the Study Area. The specific plans also address the importance of preserving open space and natural resources, including vernal pools and oak woodlands. A multi-use trail through the Study Area is an integral part of the bicycle/pedestrian master plans in the circulation elements in each of these specific plan areas.
- The *City of Roseville Design and Construction Standards* (City Standards) provide requirements for the design and construction of civil improvements within the City, including bikeways. Design of the trail through the Study Area must meet the minimum standards established in the City Standards.

- The City of Roseville Flood Damage Prevention Ordinance (Flood Ordinance) requires that new development not increase the base flood height by more than one-tenth of a foot in areas where a floodplain elevation has been established but no floodway has been designated. The Kaseberg Creek East Branch is subject to this requirement. Design of the creek crossings must meet the standards established in the Flood Ordinance.

2.1.2 Opportunities and Constraints

The existing conditions in the Study Area were assessed through site walks, trail user counts, interviews with key stakeholders, and biological surveys. Additionally, the demographics of the community and neighborhood schools were researched. This information was used to identify current use of the open space, the opportunities that could facilitate trail construction or improve trail user experience, and constraints that limit where a trail can be located. A feature may simultaneously be both an opportunity and a constraint. Opportunities identified on the site include:

Mature oak trees are a unique feature of the Study Area.

- Connections to existing paved multi-use trails including the bicycle/pedestrian trail undercrossing of Pleasant Grove Boulevard;
- Gravel maintenance access road to lift station;
- User-created dirt trails that indicate the routes users wish to take;
- City monitoring well and potential future permanent well, which may allow construction of joint access facilities;
- Woodcreek Oaks High School that uses the area for education and sports activities;
- A pipe culvert that provides a crossing of one of the smaller seasonal creeks;
- Points of interest that provide good views, unique educational opportunities, or opportunities for trail connections. Photographs of the points of interest are in included in Appendix B of the Existing Conditions Report (Appendix A);
- Natural resources such as vernal pools, oak trees, and creeks that provide visual interest and educational opportunities; and
- Mature oak trees that provide shade.

Constraints identified on the site include:

- Existing utilities including overhead utility lines, sewer lift station, and City well site;
- Surrounding residences that are sensitive to changes in noise, traffic, and the visual characteristics of the Study Area;
- Existing walls and fences around the perimeter that limit access points; and

- Sensitive natural resources including vernal pools and seasonal wetlands, mature oak trees, creeks, and riparian habitats.

These opportunities and constraints are summarized in Figure 4, located following page 8, and discussed in more detail below.

2.1.2.1 Constructed Features

Although the Study Area is an open space, there are many constructed features on site, both formal and informal. Formal improvements include a paved multi-use trail connecting to Silverado Oaks Urban Preserve to the south; a gravel maintenance access road connecting the sewer lift station to Mahany Park to the east; perimeter post and cable fences, gates, retaining walls, and soundwalls; utilities; and preserve signs. Utilities are a particular constraint to trail design as extensive overhead power lines and high voltage transmission lines and towers belonging to Pacific Gas and Electric (PG&E), Western Area Power Authority (WAPA), Sacramento Municipal Utility (SMUD), and Roseville Electric run through the open space, and a sewer trunk line with a lift station crosses the eastern half of the site from north to south (see Appendix A, Figure 8). Additionally, a monitoring well is present near the intersection of Sun City Boulevard and Pleasant Grove Boulevard. If this site is selected for a permanent well location, the new well building would likely be located on the east side of the parcel near the existing monitoring well and is expected to be constructed between 2023 and 2025.

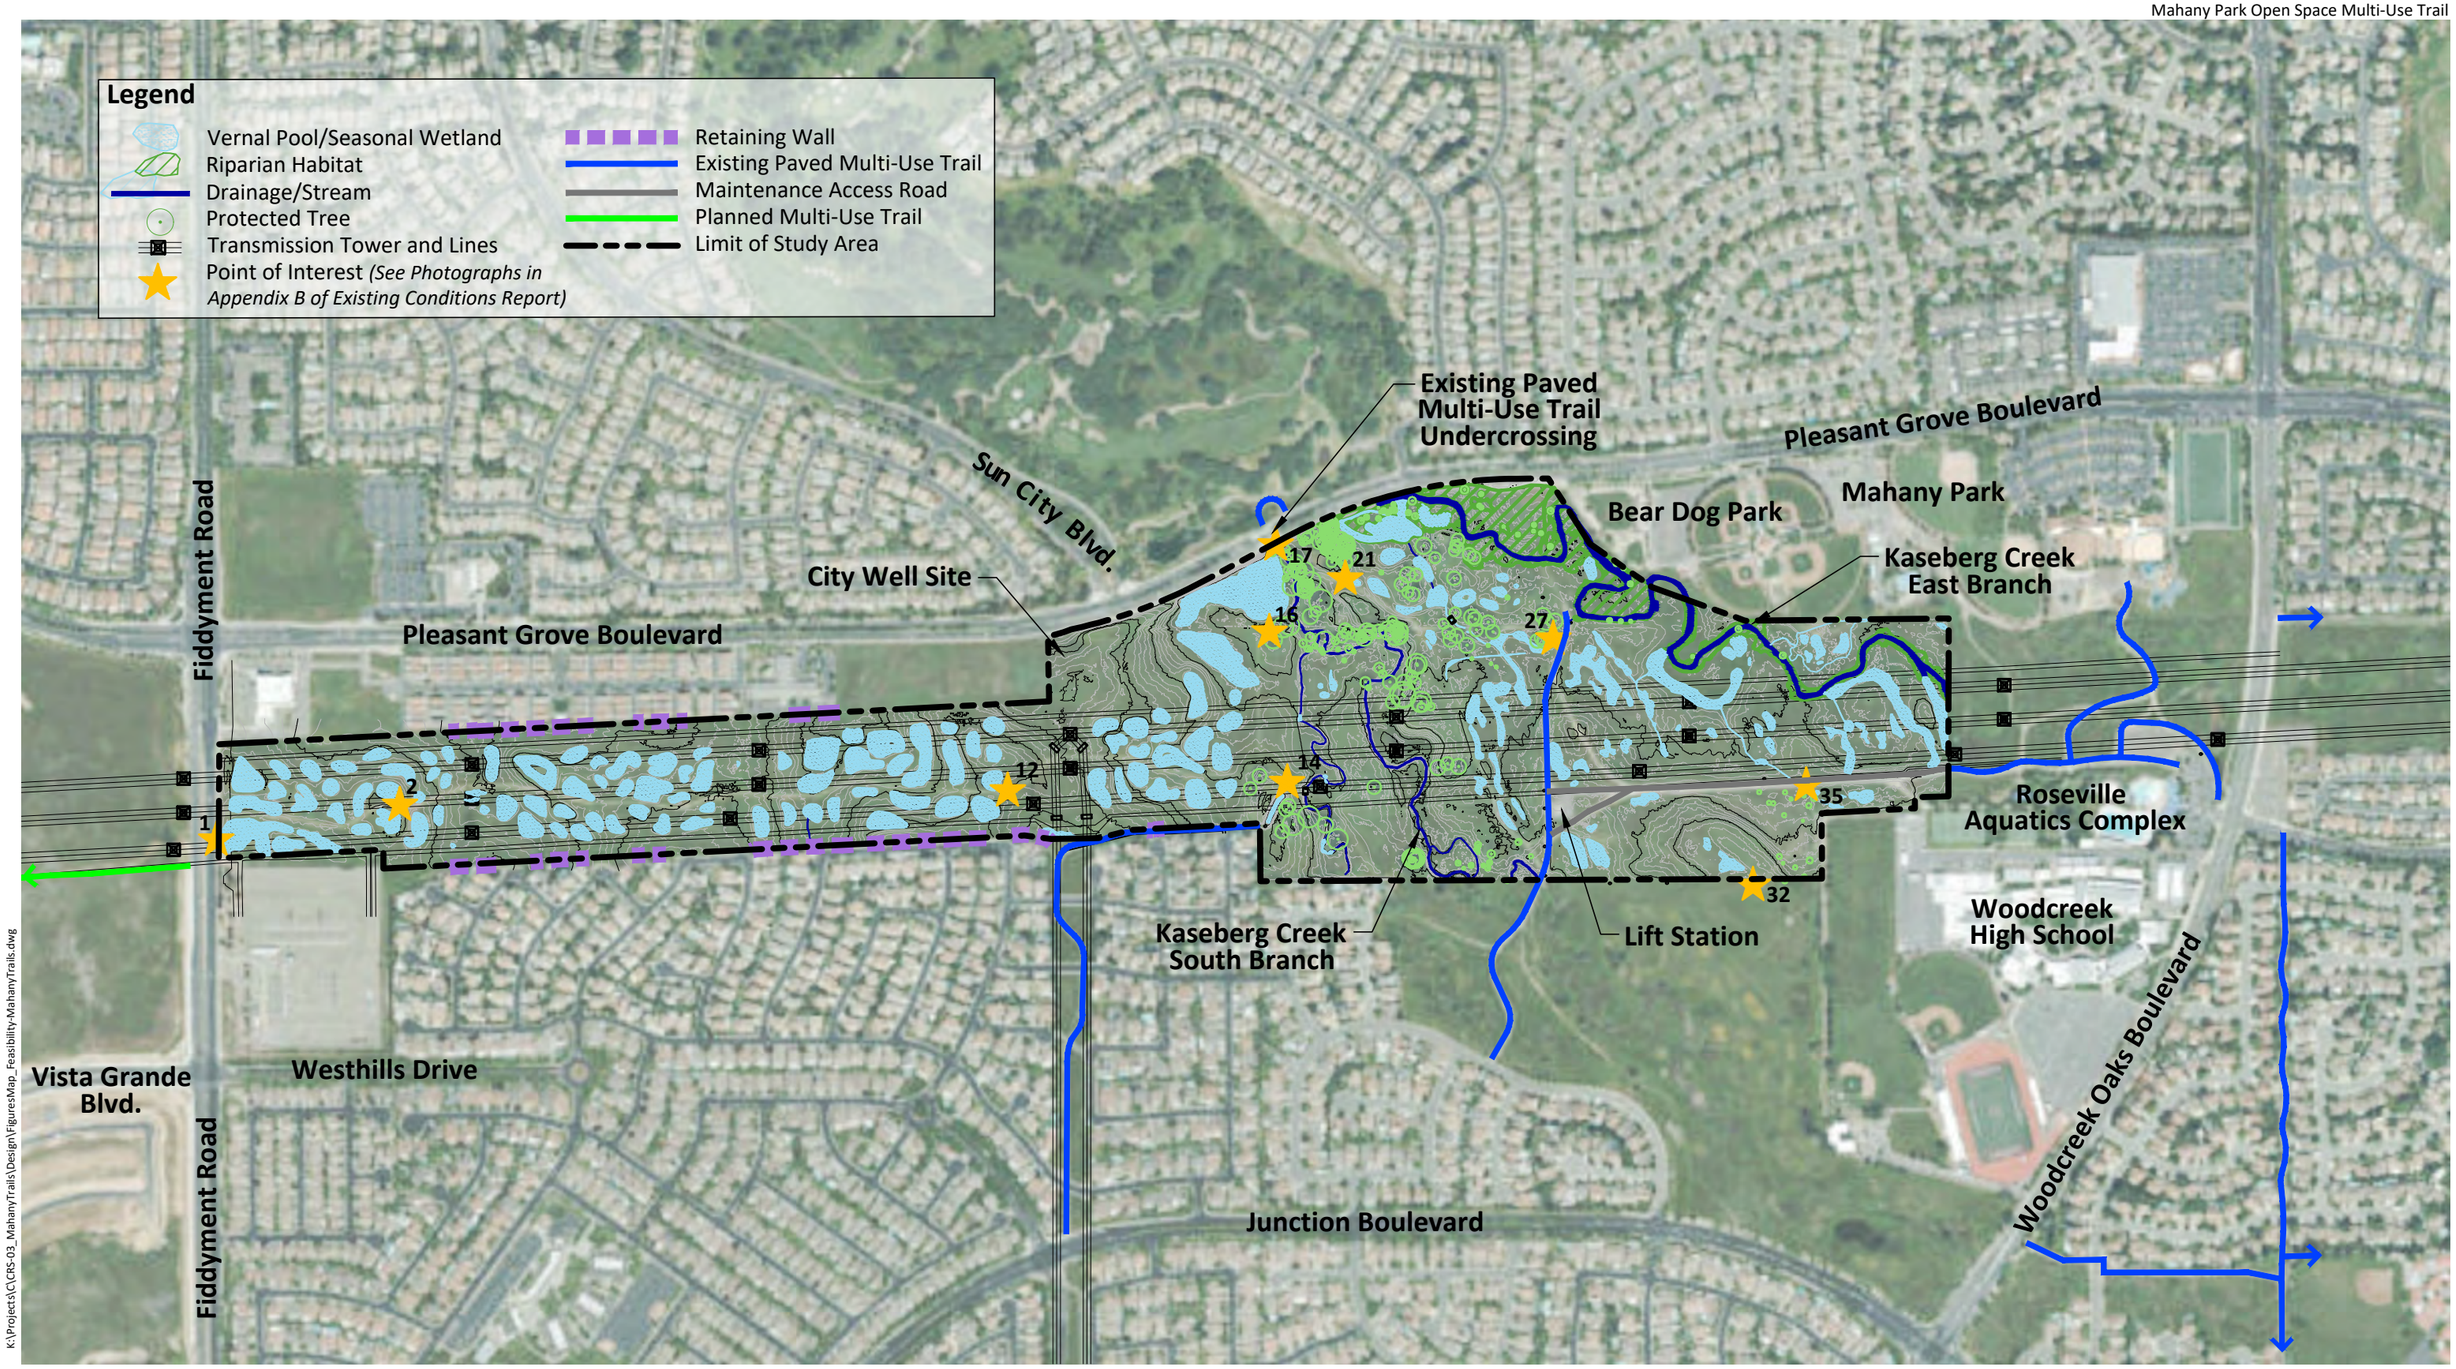
Informal improvements consist of a large network of user-created dirt paths and creek crossings. The existing dirt paths illustrate where people want to travel through the Study Area and also indicate what slopes and distances they are willing to navigate. These informal paths are also used extensively by Woodcreek High School classes and sports clubs. Along the informal paths users have constructed bike jumps, “fairy gardens” with small figures and structures, and makeshift bridges, typically of plywood, scrap lumber, or branches. Informal paths are useful to the design process because they clearly show how users wish to access the site, However, they often conflict with the City’s goals to protect natural resources and create hazards that result in public safety concerns.

Example of user-created bridge over Kaseberg Creek East Branch constructed of pallets.

2.1.2.2 Biological Resources

Although most of the Study Area is annual grassland habitat, sensitive habitats including vernal pools and seasonal wetlands, perennial and seasonal creeks, riparian habitat along Kaseberg Creek, and oak woodland composed of protected native oak trees are also present (Figure 4). Vernal pools are

Riparian areas are important habitat for mallards and other species.



naturally-occurring depressions in soils containing a hardpan or other impermeable layer that prevents water from draining through the soil. They fill with water during the winter and spring rainy season. Vernal pools support unique plants and animals that are found only in California's central valley, including some endangered and threatened species. Seasonal wetlands are similar to vernal pools in that they are wet only in the winter and spring, but typically hold water for a shorter time or may only have saturated soils and no water on the surface. Seasonal wetlands are also important habitat for many animals and plants. The network of creek channels in the Study Area includes Kaseberg Creek East Branch, a perennial creek that flows year-round, and Kaseberg Creek South Branch, which includes two smaller seasonal creek channels that only carry water after rain events. Riparian habitat is found along Kaseberg Creek East Branch (Figure 4) and includes plants that thrive on the year-round water such as willows and cottonwoods. Groves of mature oak trees form oak woodland habitat in the eastern half of the site. In addition to providing food and shelter for many species of wildlife, oak trees with a trunk greater than six inches in diameter are protected by the City of Roseville Tree Ordinance.

The potential for special-status species, plants and animals that are listed on the federal or state endangered species list or otherwise legally protected, to occur on the site was assessed. Thirty-three special-status species were identified with the potential to occur on the site. Although only one of these species, an active white-tailed kite nest, was observed during the general site surveys, those surveys were not targeted specifically for those species, so more may be present. The Biological Constraints Report provides a detailed discussion of natural resources in the Study Area, special-status species that might be found in the Study Area, and recommended design and construction measures to avoid or minimize impacts to sensitive biological resources (Appendix B).

The Study Area is home to many species; including acorn woodpeckers.

The location of sensitive habitats is an important constraint to trail design. Impacts to them should be avoided to the greatest extent possible to be consistent with the City's goals for preservation of natural resources as established in the 2035 General Plan, Open Space and Conservation Element, and the requirements of the OSPOMP. However, sensitive habitats also provide opportunities for scenic views, public education, and providing shade for trail users.

HELIX Environmental Planning

Opportunities and Constraints

Figure 4

2.1.3 Design Guidelines

Due to the utilities and protected natural resources in the Study Area, additional design requirements apply to the project. In addition to the City Standards, design of the trail must also be consistent with the OSPOMP and access and setback requirements of the various utility companies. Since the design guidelines vary between agencies, shared improvements such as gates and access roads should be designed to meet the most stringent requirements. The applicable design guidelines are included in Section 4.0 of the Existing Conditions Report (Appendix A) and summarized below.

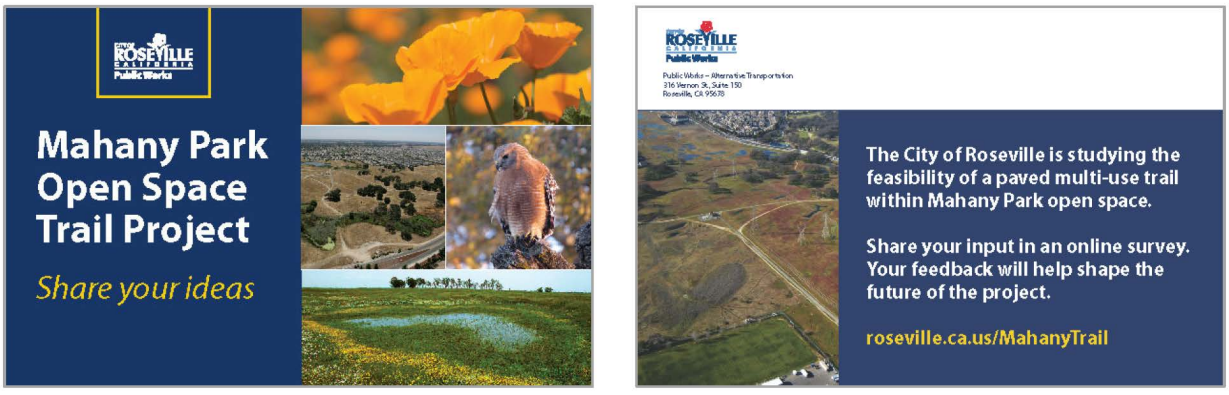
- Trail shall be 10 feet wide with a minimum 2-foot-wide graded shoulder and one shoulder shall consist of class II aggregate base and the other of decomposed granite.
- Trail segments serving as maintenance roads must be a minimum of three-inch-thick asphalt over eight-inch-thick aggregate base.
- Post and cable fence must be a minimum of three feet from paved surface.
- Width of access points for maintenance vehicles shall be at least 20 feet.
- No excavation within 10 feet of any SMUD structure.
- Creek crossings must not increase flood elevation by more than one-tenth of a foot.
- Safety and directional signs are required. Interpretive signs may be installed as appropriate.

2.2 REGULATORY AGENCY COORDINATION

Many of the sensitive biological resources are regulated by state and federal agencies. Federally-protected species are regulated by the U.S. Fish and Wildlife Service (USFWS). The U.S. Army Corps of Engineers (USACE) regulates creeks and certain other wetlands that are subject to Federal law. The California Department of Fish and Wildlife (CDFW) regulates creeks, riparian areas, and species protected by the state of California. Creeks, seasonal wetlands, vernal pools, and other water bodies are regulated by the Regional Water Quality Control Board (RWQCB). Consultation and permits from these agencies are required prior to impacting a regulated resource. As part of the preliminary design process, these agencies were contacted to determine if the conceptual design was feasible, identify any agency concerns or standards pertaining to design of the trail, and review the permit process. A summary of the discussions with the regulatory agencies is included in Appendix C.

Since the majority of the site was established to protect the vernal pool habitat and because vernal pools are subject to regulation as a wetland and as habitat for special-status species, avoiding or minimizing impacts to vernal pools is a prime concern for the agencies described above. Minimizing impacts includes avoiding direct impacts caused by constructing the trail through a pool and minimizing indirect impacts, such as changing the drainage patterns around vernal pools with grading and paving. To minimize impacts to this sensitive habitat, the trail should be located away from the pools whenever possible.

Creek crossings were another major point of concern to regulatory agencies because there is the potential to impact water bodies and riparian habitat. Constructing a bridge that completely spans the channel, rather than installing a pipe or box culvert is one way to minimize impacts to these resources. The trail should also be kept outside of the riparian habitat whenever possible.



If special-status species, as described in Section 2.1.2.2, are found in the Study Area in the future, there may be additional design requirements to avoid or minimize impacts to them. Recommendations for additional studies and permits are discussed further in Section 4.

2.3 PUBLIC ENGAGEMENT

Public engagement was an important part of the project that directly influenced the development of the recommended trail alignment. Due to social distancing requirements caused by the COVID-19 pandemic, all outreach efforts were virtual. Members of the public were informed about the project and opportunities to provide their input through the City's social media, e-mail lists, and project website; signs posted in the Study Area; a local TV news story; and direct mailing to local residents. In lieu of in-person workshops, two online surveys were developed to inform and engage the public in the process of developing a recommended trail alignment.

2.3.1 First Online Survey

The purpose of the first online survey was to introduce the project, share the reasons why it is being done, and gather information on how respondents currently access and use the Study Area and how they would like to access and use it. The survey also gathered information about preferred trail amenities, and views about the pros and cons of a paved multi-use trail in the Study Area. The survey was available online from May 26, 2020 to June 12, 2020. It was publicized by the City through email to more than 48,000 recipients, social media (Facebook, Twitter, Instagram, and Nextdoor) resulting in more than 27,000 impressions, and direct mailing to more than 7,500 households in the neighborhoods surrounding the Study Area. Informational signs with the survey website were also placed around the Study Area. Additionally, the City shared an informational video on its YouTube, social media, website, and e-mail channels and ABC 10 aired a news story about the project. A total of 1,306 responses were received.

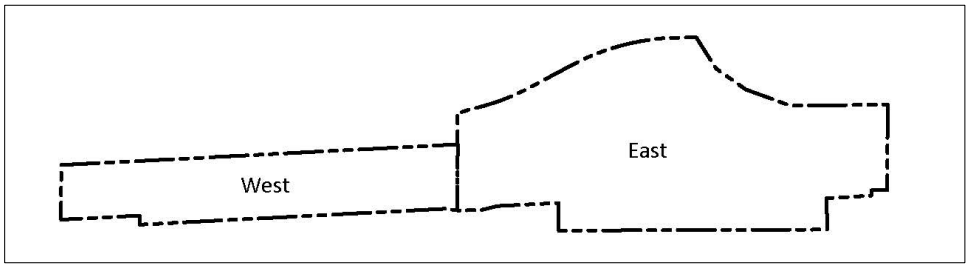
Front *Back*

Postcard mailed to residences within a half-mile of the Study Area notifying them of the first online survey.

Social media post used to publicize the first online survey.

Informational signs posted around the open space to advertise the first online survey.

The results of the first online survey indicated that the existing gravel access road on the east and the gate and dirt path at Fiddyment Road are the two most-used access points, followed by Mahany Park's parking lot, Silverado Oaks Urban Reserve on the south, Pleasant Grove Boulevard bicycle/pedestrian underpass, and Pleasant Grove Boulevard by Bear Dog Park. The most desired access points are the existing gravel maintenance road on the east, the dirt path at Fiddyment Road, and Bear Dog Park on Pleasant Grove Boulevard. The most used and most desired access points are shown on Figure 6 of the Existing Conditions Report (Appendix A). There was strong support for including trash cans, benches, dog waste stations, and directional, wayfinding, and educational signs in the project as well as significant interest in exercise stations. Overall, there was strong support for the concept of a paved trail, with almost half the respondents indicating they have no concerns; however respondents expressed a desire to retain dirt trails for aesthetic and recreation purposes. Additionally, there was concern that improved access from the surrounding neighborhood may lead to increased traffic. A summary of the first online survey is included in Appendix D of the Existing Conditions Report (Appendix A).



The results of the first online survey were used to develop potential trail alignment options. Many of the suggested amenities have been included in the conceptual design, as discussed in Section 3.3. Additionally, the desire to retain dirt paths led to the consideration of expanded shoulders along the proposed trail. Potential off-site parking locations at the west end of the Study Area were considered to address concerns about increased traffic in residential neighborhoods.

2.3.2 Second Online Survey

The purpose of the second online survey was to present the options for a trail alignment through the Study Area and gather feedback to inform a final recommendation. The trail alignment options presented in the survey were developed based on the opportunities and constraints and biological resources reports, results of the first online survey, regulatory agency coordination, and City goals and policies.

To simplify the presentation of the alignment options, the Study Area was split into east and west sections (Figure 5). Three alignment options were developed for the western half of the Study Area and two alignment options were developed for the eastern half of the Study Area. Any of the western options could be used with either of the eastern alignment options.

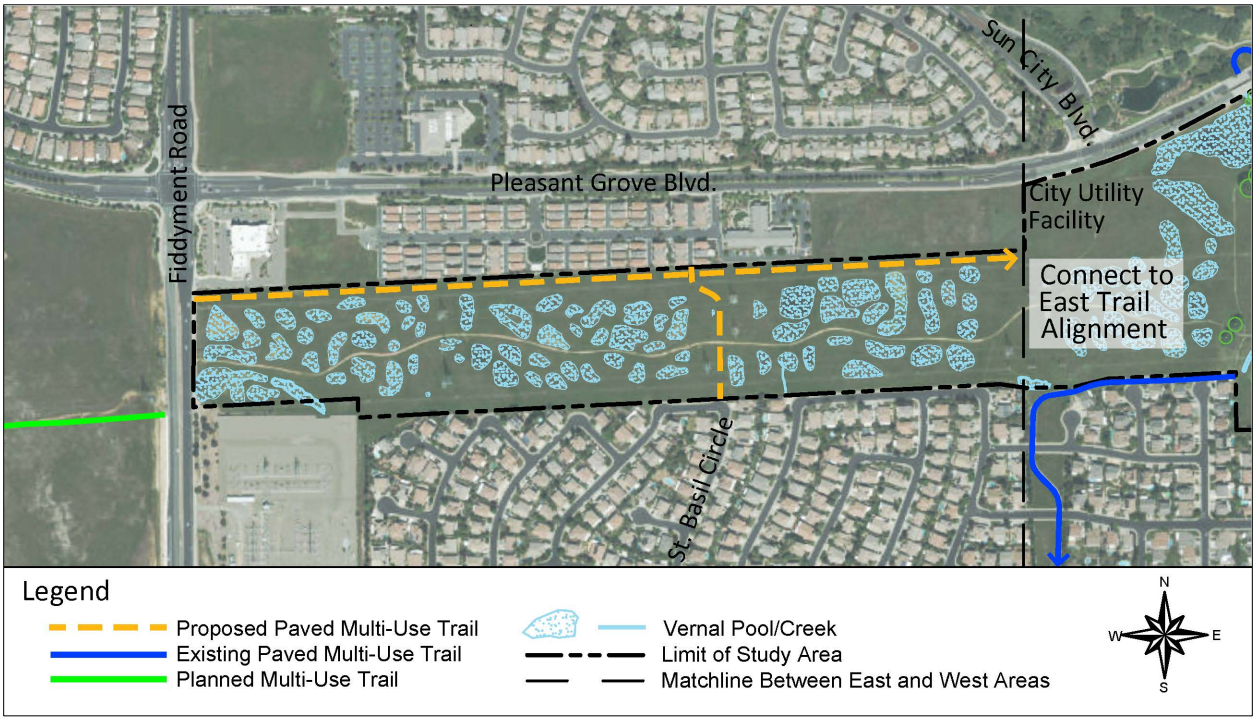


Figure 5
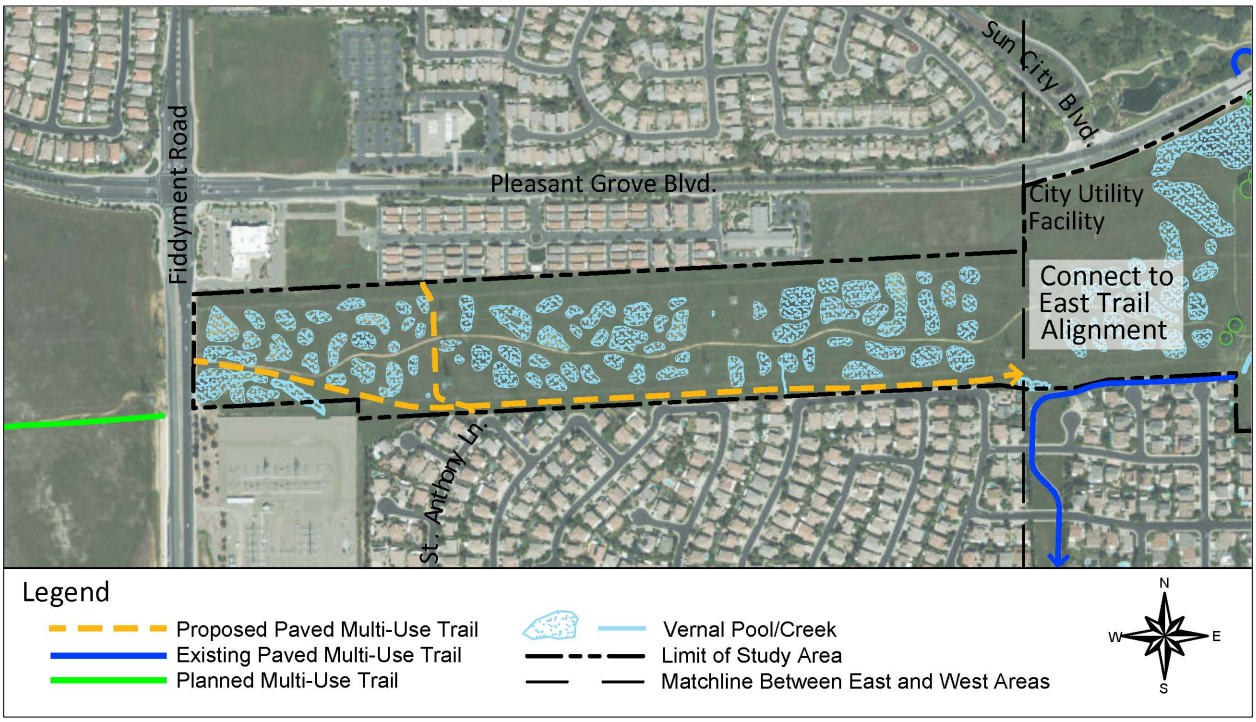
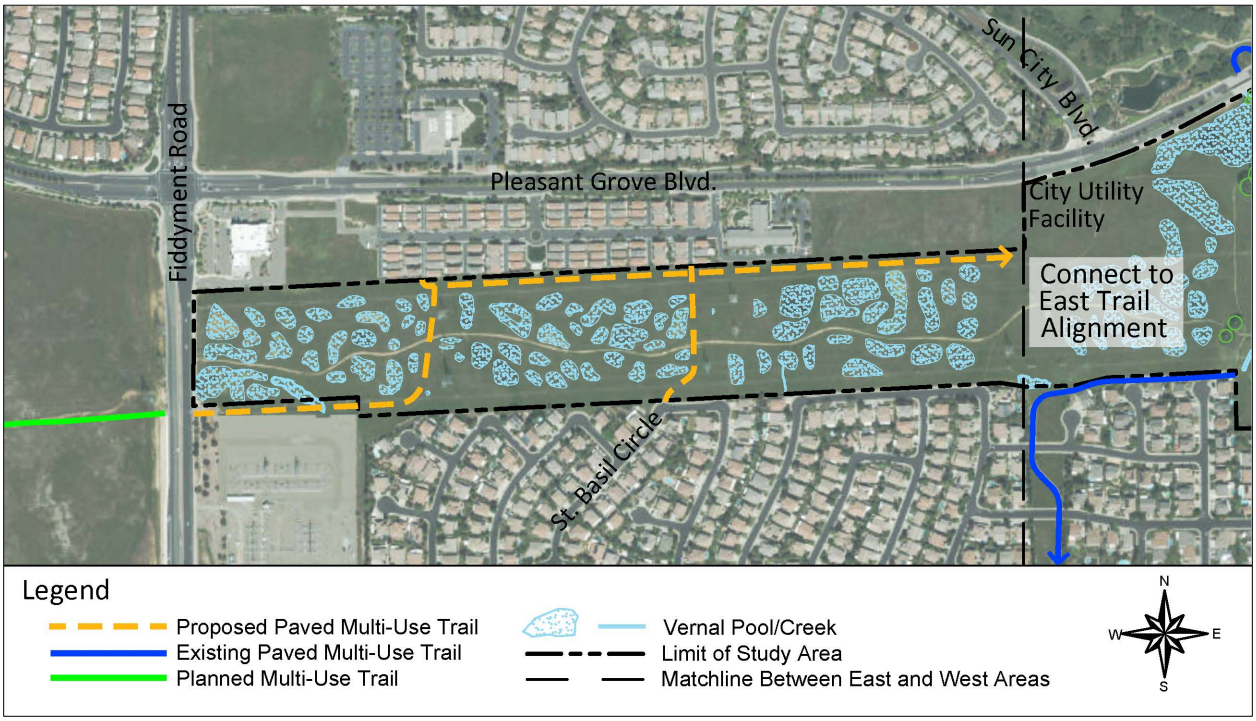
STUDY AREA SECTIONS

2.3.2.1 Western Area Options



Western Option A (Figure 6) located the proposed trail along the northern edge of the Study Area between the utility lines and the northern property boundary. This option included a connection between the residential developments to the north and south of the Study Area at Saint Basil Circle. This option provides a connection to Fiddyment Road closest to the existing signalized intersection with Pleasant Grove Boulevard.

Figure 6
WESTERN OPTION A

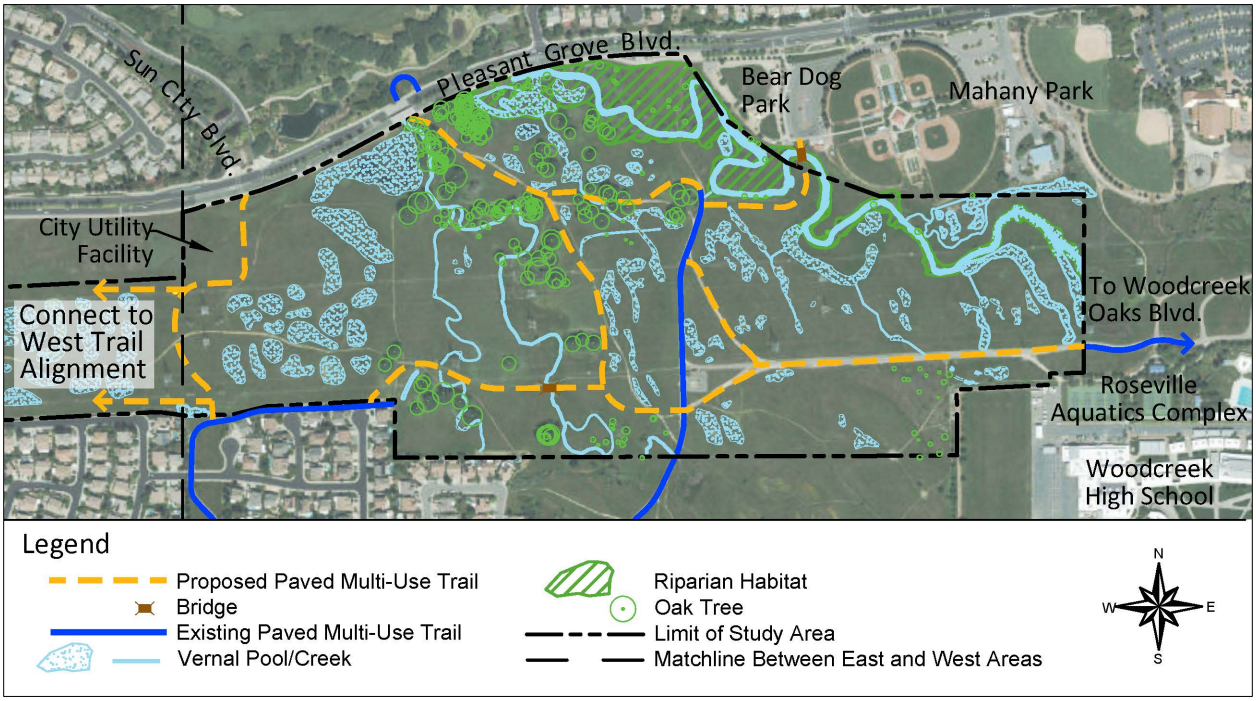


Western Option B (Figure 7) located the proposed trail mostly along the southern edge of the Study Area, veering north through the vernal pool complex for the final 900 feet to meet Fiddyment Road at the existing gate near the center of the western property line. This option included a connection between the residential developments to the north and south of the Study Area at Saint Anthony Lane.

Figure 7
WESTERN OPTION B

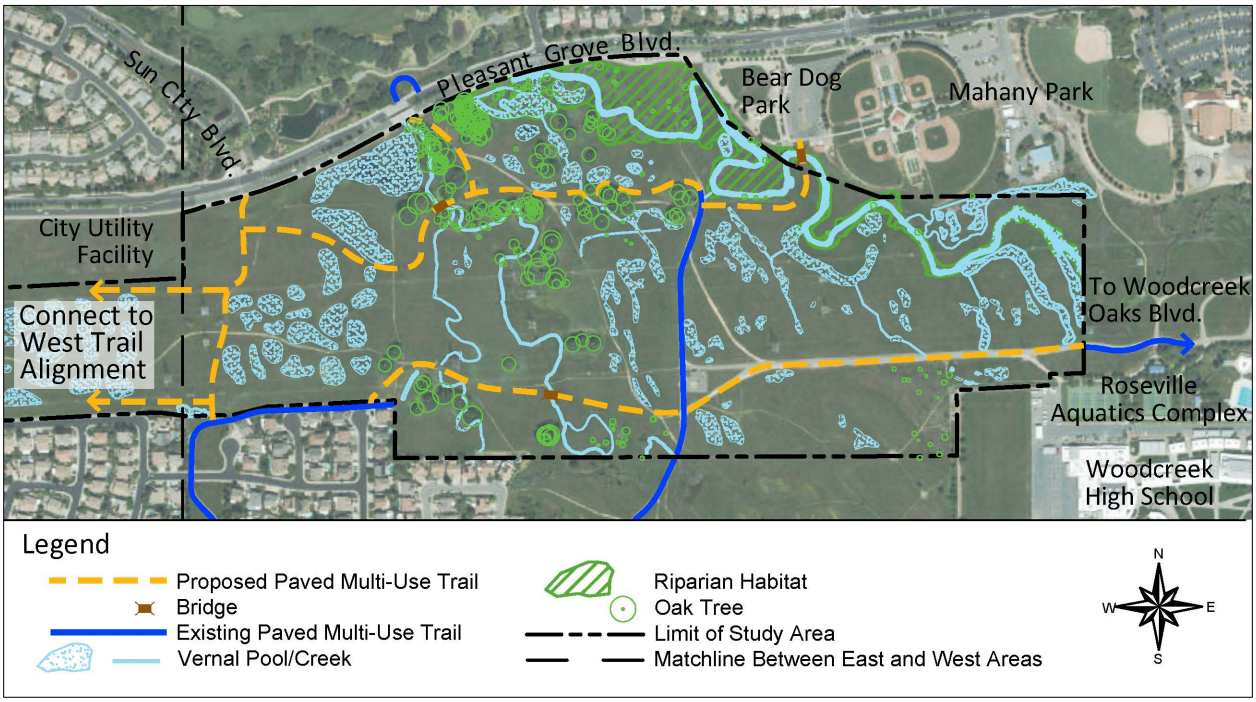
Western Option C (Figure 8) located the majority of the proposed trail along the northern boundary, before curving south through the vernal pool complex to extend along the southern boundary for the western 800 feet. It also includes two connections between the residential developments to the north and to the south of the Study Area. This option connects to Fiddyment Road directly across from the planned trail in the Sierra Vista Specific Plan and would require a mid-block crossing on Fiddyment Road. Although this option provides the most direct connection to the City's bikeway network, the southern connection to Fiddyment Road would require construction on the City-owned parcel to the south and will directly impact a vernal pool.

Figure 8
WESTERN OPTION C



.

2.3.2.2 Eastern Area Options



Eastern Option A (Figure 9) proposed a small loop trail in the eastern third of the Study Area consisting of the existing multi-use trail and one of the largest existing dirt paths. This option includes a bridge over Kaseberg Creek for a year-round connection to Bear Dog Park, connections to the existing multi-use trails adjoining the Study Area, and connections to the signalized intersection of Sun City Boulevard and Pleasant Grove Boulevard. This option includes a second bridge over the seasonal creek to allow year-round use of the trail.

Figure 9
EASTERN OPTION A

Eastern Option B (Figure 10) proposed an approximately one-mile loop trail connecting the existing multi-use trails in and adjacent to the Study Area. A new trail segment connects the signalized intersection of Sun City Boulevard and Pleasant Grove Boulevard and the existing greenbelt bike trail just south of the Study Area. This north-south segment is connected to the existing multi-use trail in the Study Area by two trail segments to form a loop. This option includes three new bridges allowing year around use of the trail network through the Study Area. This option also includes a connection to Bear Dog Park and all the existing multi-use trails adjoining the Study Area.

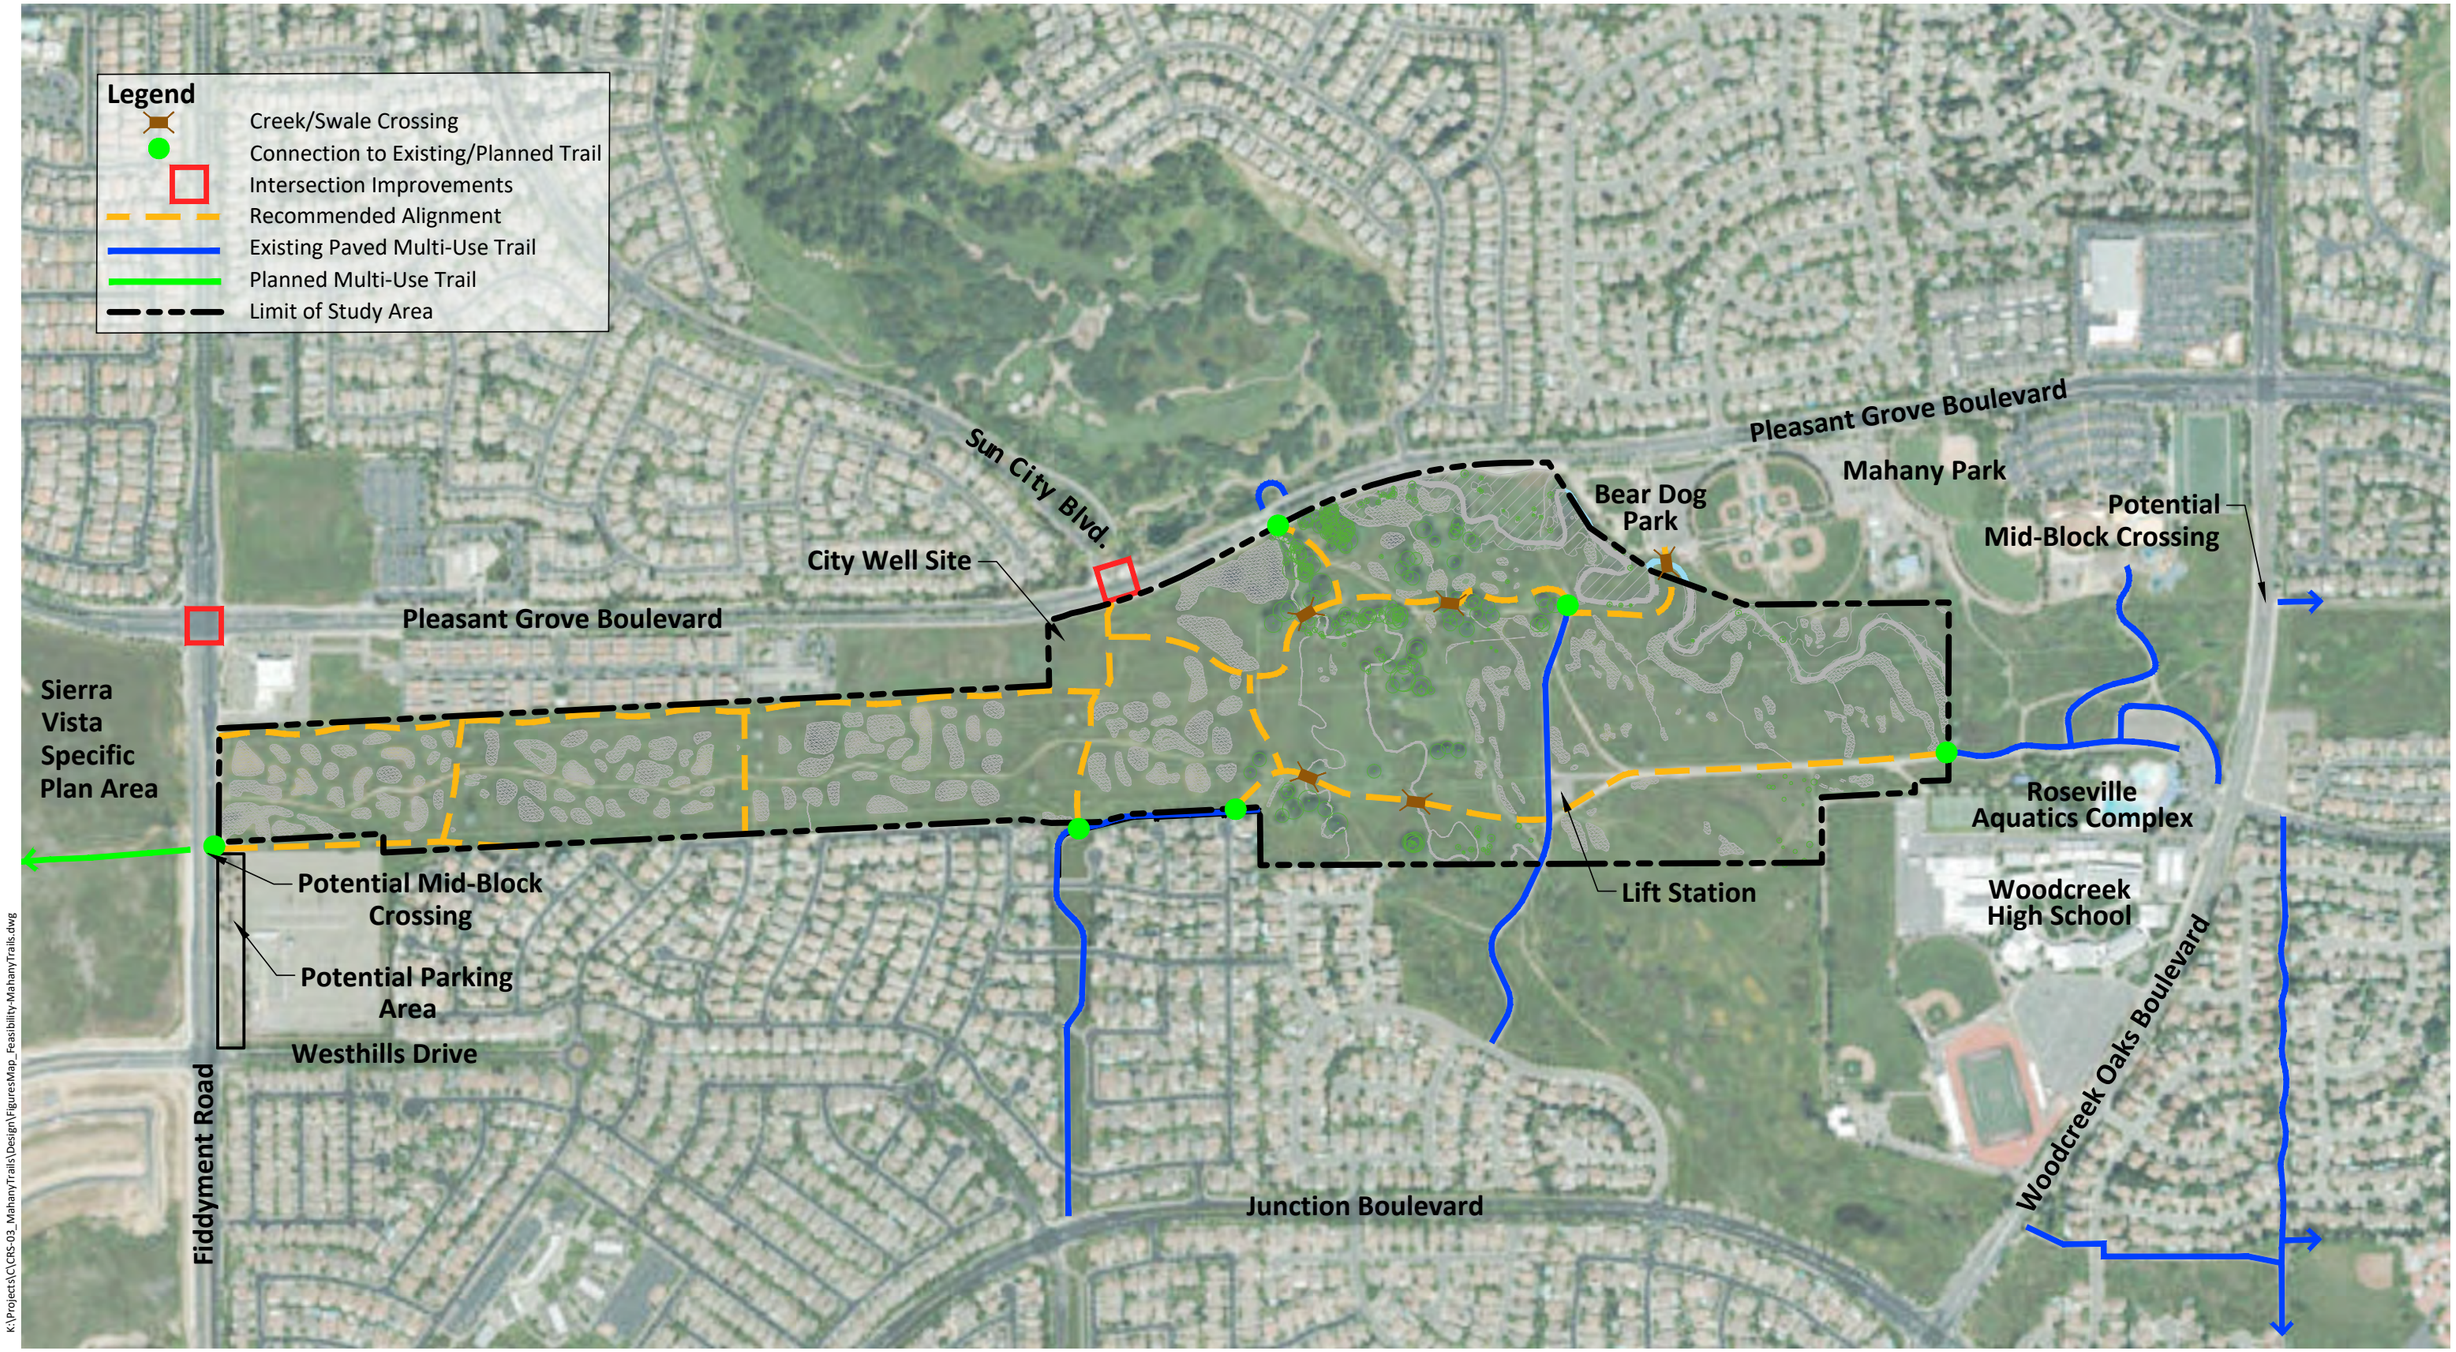
Figure 10
EASTERN OPTION B

The second online survey was available between October 31 and November 13, 2020. The survey was publicized via the City's existing communication links, including emails to almost 55,000 recipients, newsletters, social media (Facebook, Twitter, Instagram, and Nextdoor), and lawn signs with the website address that were placed along paths in the Study Area and in the neighboring community directing people to the survey. This outreach effort resulted more than 15,200 impressions. A total of 326 survey responses were received. The summary of the responses to the second virtual survey is included in Appendix D.

Overall, respondents preferred Western Option A, which locates the trail along the north boundary of the site, due to its connection to Fiddyment Road and the location of the north-south connection to residential neighborhoods. There was also significant interest in Western Option C due to the potential mid-block crossing connection to trails in the Sierra Vista Specific Plan Area. However, this option also generated concerns about increased costs and longer schedule due to environmental impacts because of the trail's proximity to vernal pools.

Eastern Option B, which provides the longer loop trail, and includes areas of shaded trail through the oak woodlands, was slightly preferred over Eastern Option A.

The survey format also encouraged written comments from survey participants. Common issues of concern included safety in crossing Fiddyment Road and other larger streets, potential disruptions or increase in parking/traffic in nearby neighborhoods, impacts to natural resources, and the desire for continued use of the existing dirt paths. Respondents also noted suggestions for other trail amenities, including privacy fences, benches, dog waste stations, exercise stations, bathrooms, directional and educational signage, and shade.



3.0 RECOMMENDED PROJECT

The recommended project was developed using information from existing planning documents; site assessments resulting in the Biological Resources and Opportunities and Constraints Reports; interviews with stakeholders; a robust public engagement program including two online, interactive surveys; consultation with regulatory agencies; and ongoing coordination with City departments. These efforts identified a recommended project which will:

- Provide multiple, connections to the surrounding neighborhoods, schools, trails, roads, and parks;
- Provide permanent all-weather crossings of creeks in the Study Area to allow safe use year-round;
- Protect natural resources, including vernal pool habitat;
- Maintain required access for existing utilities;
- Close gaps in the trail and bikeway system to provide safe, convenient bicycle/pedestrian connections to recreational, educational and employment opportunities for people of all ages, abilities, and incomes; and
- Include a variety of amenities along the trail.

3.1 ALIGNMENT

The recommended alignment (Figure 11) combines elements of multiple options presented in the second online survey. It addresses gaps in the existing bikeway system with approximately 2.4 miles of new trail connecting to all of the existing multi-use trails. The recommended alignment provides access through the open space preserve while protecting sensitive habitats and provides opportunities for users to learn more about why it is important to protect these areas. It provides safe, convenient bicycle/pedestrian connections to recreational, educational, and employment opportunities for people of all ages, abilities, and incomes.

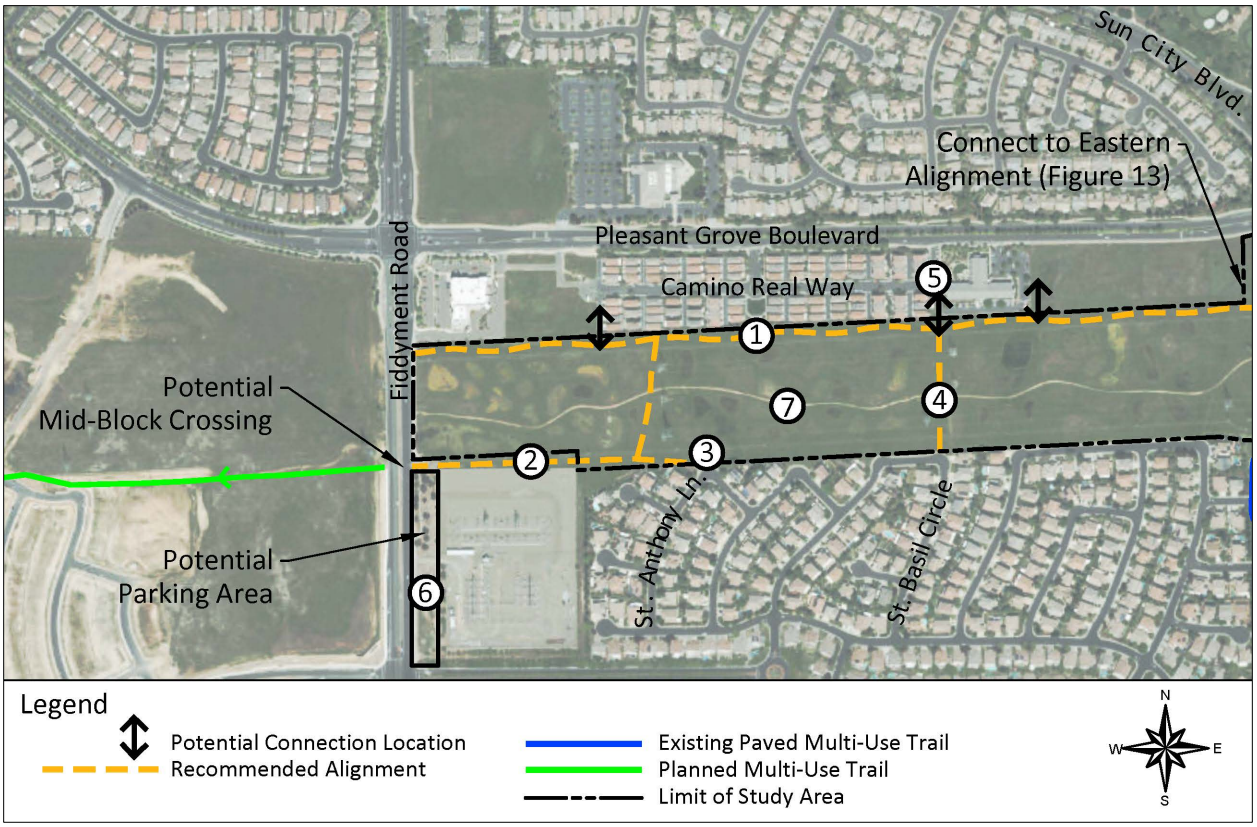
0 600 FEET

N W E S

HELIX Environmental Planning



Recommended Trail Alignment

Figure 11

3.1.1 Recommended Western Alignment

The recommended western alignment combines elements of Western Options A and C. Key features of the recommended alignment in this area are shown in Figure 12 and described below.

Figure 12
RECOMMENDED WESTERN ALIGNMENT

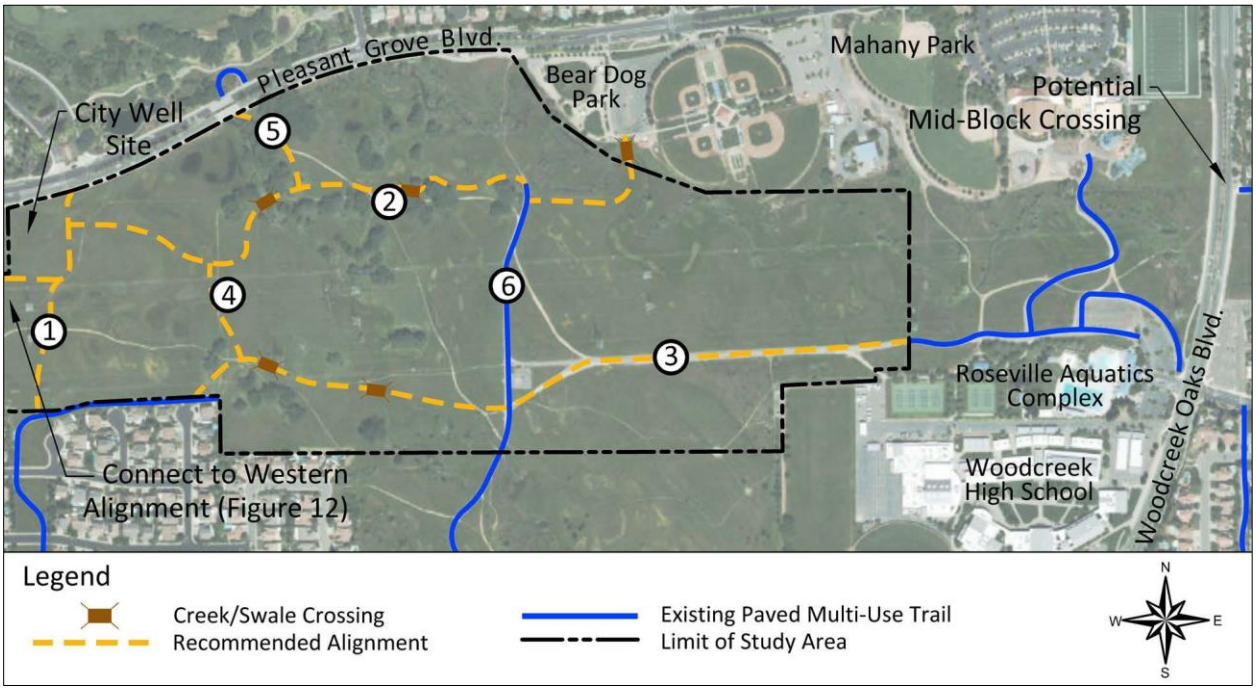
1. The recommended trail alignment meanders between the existing utility lines and the northern property boundary of the Study Area. This alignment places the majority of the trail away from vernal pools and overhead utility lines. Additionally, the width of the area allows the trail to be set back from adjacent residences to the north. The trail meanders gently through the area to provide interest for users, a concern expressed in the second online survey. This trail segment offers a connection to Fiddyment Road close to the Pleasant Grove Boulevard intersection to facilitate active transportation connections between neighborhoods, schools, recreational and employment opportunities in west Roseville.

2. This trail segment crosses through the vernal pool complex and runs along the wall adjacent to the existing electrical substation to Fiddyment Road. This location was chosen to take advantage of a break in the vernal pool complex and minimize locating the trail directly adjacent to residences south of the Study Area. This segment will connect with the planned trail in the Sierra Vista Specific Plan area on the east side of Fiddyment Road and will require safety improvements to provide a mid-block crossing.

3. A short trail segment connects the segment described in #2 with Saint Anthony Lane to provide access to the bikeway network from this neighborhood.

4. This trail segment connects the northern trail segment to the neighborhoods in the south. This location was chosen to take advantage of a break in the vernal pool complex, in order to minimize impacts to this habitat, and to provide evenly spaced access to the bikeway network.

5. An access point to the neighborhoods north of the Study Area is needed to provide a connection to the bikeway network, but its exact location has not been determined. Potential connection locations are limited by a number of retaining walls located along the northern boundary of the Study Area. A possible location is an extension of the trail segment described in #4. This location is also located near the Eskaton senior living facility which may facilitate access to the open space for residents with limited mobility. Another possible location is at the west end of Camino Real Way, however there are concerns that either of these connections would worsen already limited parking availability in the neighborhood to the north. Alternately, it may be feasible to include a trail access point with a future project on the currently undeveloped property between Pleasant Grove Boulevard and the recommended trail alignment.



6. This area has been identified as potential off-street parking on City-owned property along Fiddyment Road. This area could provide a parking option on the west end of the Study Area, reducing the potential for people to park in the nearby residential neighborhoods.

7. The dirt path which meanders through the center of the west half of the Study Area, encroaches on the vernal pool complex and is not recommended for improvement as a formal trail, or for continued use. This dirt path should be restored to grassland to reduce impacts to sensitive habitat and special-status species, consistent with the OSPOMP.

3.1.2 Recommended Eastern Alignment

The recommended eastern alignment provides "loop" trails that connect existing trails and many of the most heavily used access points. This design modified Eastern Option B by adding a second short connection between the north and south sides of the loop. Key features of the recommended alignment in this area are shown in Figure 13 and described below.

Figure 13
RECOMMENDED EASTERN ALIGNMENT

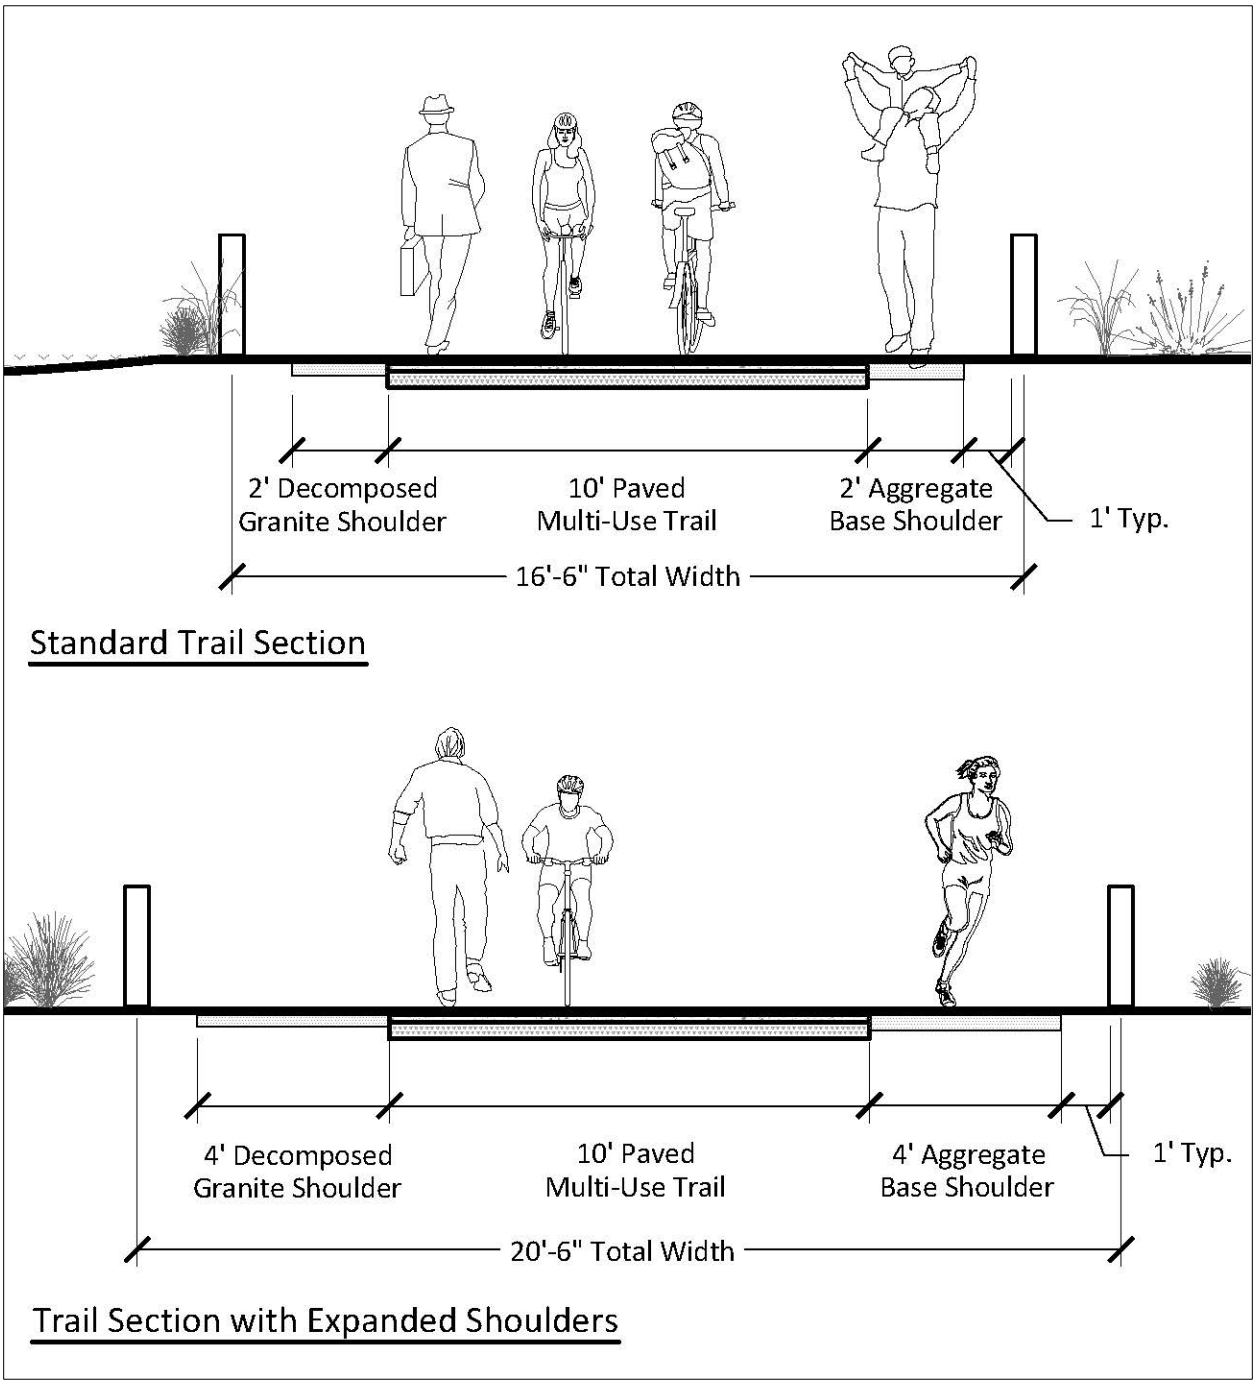
1. This trail segment extends the existing multi-use trail from the neighborhood to the south through the vernal pool preserve to the Sun City Boulevard intersection. This central north-south segment is a vital connection in the bikeway network because it connects to the west area trail that leads to Fiddyment Road, to Pleasant Grove Boulevard and the Sun City neighborhood to the north, and to the two trails that form the loop in the east side of the Study Area. This trail segment provides opportunities for education and rest areas with good views across the vernal pool landscape. A City well site is being explored next to this trail segment. Future trail construction will require coordination with the City's Environmental Utilities department to explore funding opportunities for a shared access facility.

2. The northern trail segment winds around seasonal wetlands and through oak woodlands on the way to Bear Dog Park, which was identified through the public engagement process as one of the most desired access points to the Study Area. This segment creates permanent crossings over the seasonal creek, a small seasonal swale, and Kaseberg Creek and also provides segments of shaded trails, which were identified as highly desired by participants in the public engagement process The location of this trail segment provides unique opportunities for educational opportunities relating to the oak woodlands, creeks, and riparian habitat.

3. The southern trail segment starts at the end of the existing multi-use trail that currently provides connections to Woodcreek High School, the Roseville Aquatic Center, and the eastern portion of Mahany Park. This segment will pave the existing gravel maintenance road and includes two creek crossings, thereby providing year-round access through the site. This connection also provides access to the City bikeway network east of Woodcreek Oaks Boulevard.

4. A short spur trail connects the northern and southern trails (#2 and #3) before they cross the seasonal drainages, forming an inner loop. This short connector trail between the north and south trails provides users with options for length of trail they wish to travel.

5. This trail segment connects northern trail segment (#2) to the existing Pleasant Grove Boulevard undercrossing. This is an important connection because it provides access to the wide sidewalks and Class II bike lanes on the north side of Pleasant Grove Boulevard



6. Trail segments #2 and #3 connect with the existing multi-use trail that runs north/south through the Silverado Oaks Preserve.

3.2 TRAIL DESIGN

The trail will generally use the City Standard trail design in accordance with the current City *Design and Construction Standards*. All of the constructed trails will consist of a ten-foot wide paved trail with one aggregate base shoulder and one decomposed granite shoulder. In response to public comments indicating a desire to retain dirt trails, wider shoulders may be used in some areas to provide additional areas of unpaved trail. Figure 14 shows typical trail sections.

The City Standards refer to Caltrans standards for design speed, turning radii, and other engineering design requirements. The standard design speed for multi-use trails is 20 mph, which requires a minimum radius of 90 feet and stopping distance of 125 feet. Additionally, any areas steeper than 4% for more than 500 feet require design using a design speed of 30 mph and stopping distance of 230 feet (Caltrans 2019). Although the recommended alignment incorporated these standards to the greatest extent possible, site constraints such as steep slopes near creek channels and locations of protected oak trees, create areas where the design standards cannot be met. Areas that exceed 5% slope or do not comply with minimum radius standards and therefore will require additional consideration during project design are shown in Appendix E. Countermeasures, such as warning signs and striping, will be required on any trail sections that do not meet the design standards.

Figure 14
TYPICAL TRAIL SECTIONS

3.2.1 Pavement Materials

Although the current City Standard for trails outside of flood zones is asphalt paving, concrete; permeable asphalt; permeable concrete; or stabilized decomposed granite or #9 crushed gravel may be considered for some trail sections. Although other materials are more expensive to install than standard asphalt, they may provide other benefits that balance the life-cycle cost. Pavement materials options should be explored during preliminary engineering. Key design considerations of these materials are summarized in Table 1 (FHWA 2012 and 2015).

Table 1
PAVEMENT MATERIALS OPTIONS

Material	Pro	Con	Estimated Cost per LF of Trail
Standard Asphalt	• City Standard material • Can be resurfaced • Standard paint markings can be used	• Requires periodic resurfacing	$30
Pervious Asphalt	• Reduced runoff may reduce impacts on vernal pool and creek hydrology • Less ponding makes safer to use in rain	• Cannot be resurfaced by seal coating or crack sealing • Requires regular vacuuming to maintain permeability • Paint pavement markings should be limited to retain permeability • Requires specialized installation	$60
Standard Concrete	• Longer lifespan than asphalt paving • Currently used in floodprone areas of City bikeways • Standard paint markings can be used	• Less flexible than asphalt • Cracks or uneven sections are hard to repair and can cause a safety hazard	$130
Pervious Concrete	• Longer lifespan than asphalt • Reduced runoff may reduce impacts on vernal pool and creek hydrology • Less ponding makes safer to use in rain	• Requires regular vacuuming to maintain permeability • Paint pavement markings should be limited to retain permeability • Requires specialized installation	$190
Decomposed Granite	• Provides softer, more natural surface for running and mountain biking • Reduced runoff may reduce impacts on vernal pool and creek hydrology	• High maintenance costs for washout and weed control • Easily rutted in wet weather	$135
Stabilized Crushed Gravel	• Provides softer, more natural surface for running and mountain biking • Reduced runoff may reduce impacts on vernal pool and creek hydrology	• May be rutted in wet weather • Requires weed control	$150

3.2.1.1 Lift Station Access

There is an existing lift station on the eastern end of the site at the end of the existing gravel maintenance road (Figure 4). The recommended trail segment between the existing parking lots at the Aquatics Center to the east and the lift station, which is currently a gravel maintenance road, should be engineered to accommodate heavy construction vehicles. Access and clearance requirements in this area should be confirmed with City Environmental Utilities staff during preliminary engineering.

3.2.2 Creek and Swale Crossings

In order to allow safe year-round trail use and maintain the existing hydrology, permanent crossings of creeks and swales will be constructed. Swales are small depressions where water flows but that do not have a defined bed and bank, they often connect vernal pools and seasonal wetlands. These crossing structures may be large bridges across the seasonal and perennial creeks or small pipes that allow water to flow under the trail from one wetland to another. Based on the creeks and wetlands mapped in the Existing Conditions Report, five crossings will be required for the recommended alignment (Figure 11).

Existing bridge over seasonal creek in the Silverado Oaks Open Space just south of the Study Area.

It is anticipated that three larger creek crossings will be necessary to provide year-round use of the proposed trail. The crossings of the larger creeks can be either bridges or open-bottom culverts. Bridges can span a long distance and be installed entirely outside of the creek channel, which can reduce environmental impacts and avoid or minimize the need for permits from regulatory agencies, but often cost more to construct. An open-bottom culvert is typically a three-sided concrete box with no bottom, which allows the native streambed to be preserved. Culverts are often installed within the stream channel, requiring permits from regulatory agencies, but may also span over the channel similar to a bridge. One crossing is planned to use a large existing pipe culvert through which the western seasonal drainage flows. The final crossing is expected to be a new small pipe culvert over a seasonal swale. The exact design and material of crossings will be determined during preliminary engineering and should consider construction, maintenance, and permitting costs as well as the requirements of the Flood Ordinance. Additionally, the large existing pipe culvert should be investigated further during preliminary engineering to verify its ability to support a paved trail.

3.2.3 Connections to Existing and Planned Bikeway System

3.2.3.1 Planned and Existing Bikeways

The recommended alignment connects to all five of the existing multi-use trails that enter the Study Area and provides important bicycle/pedestrian connections from surrounding residential areas to transit stops, employment, education, and recreation opportunities (Figure 11). Additionally, the trail

will connect to the planned multi-use trail in the Sierra Vista Specific Plan area by way of a mid-block crossing, which is discussed below.

3.2.3.2 Road Crossings

The recommended alignment will connect with Fiddyment Road at two locations (Figure 11). The northern connection is located closest to the intersection with Pleasant Grove Boulevard and provides access for people desiring to travel to the neighborhoods to the north and west. Intersection improvements to facilitate bicycle traffic that should be considered during preliminary engineering, include:

- High-visibility bike lanes;
- Widening sidewalks to 10-feet wide between Study Area and Fiddyment Road/Pleasant Grove Boulevard intersection to allow shared use in both directions;
- Leaning rails, if compatible with right turn pocket; and
- Bicycle signal improvements.

Example of intersection improvements for bicyclists.

The southern connection aligns with the future multi-use trail in the Sierra Vista Specific Plan Area. Due to the high volume and speed of traffic on Fiddyment Road, this southern connection is not feasible without a mid-block crossing. Due to the overhead utility lines in the area, this crossing is expected to be an at-grade crossing and should include:

- High-visibility crosswalks;
- Pedestrian hybrid beacon or pedestrian signal;
- Crossing warning signs;
- Warning signage and stop lines; and
- Adequate nighttime lighting (Fehr and Peers 2020).

View of mid-block crossing location on Fiddyment Road looking toward the Sierra Vista Specific Plan Area.

The recommended alignment connects to Pleasant Grove Boulevard at the existing signalized intersection with Sun City Boulevard (Figure 11). Although there is an existing crosswalk at this location, the addition of intersection improvements to facilitate bike crossings should be investigated further during preliminary engineering. This connection is intended to be an access point for local residents taking advantage of the existing crosswalk at the intersection rather than an access point for regional users, no parking is provided at this location.

The recommended alignment also connects to the existing bicycle/pedestrian undercrossing of Pleasant Grove Boulevard (Figure 11), which provides access to the sidewalk and Class II bike lane on the north side of the street. Currently, there is a driveway apron that allows access between the undercrossing

and the westbound bike lane. A connection from the undercrossing to the eastbound bike lane on Pleasant Grove Boulevard was not considered at this location due to the steep existing grades and surrounding biological resources, but the eastbound bike lane will be accessible at the Sun City Boulevard intersection. Additionally, high-visibility bike lanes along Pleasant Grove Boulevard should be considered during preliminary engineering.

Although the Study Area does not extend to Woodcreek Oaks Boulevard, it will form a major link between the trail system east of Woodcreek Oaks Boulevard and the western portion of the City, potentially increasing the amount of trail-user traffic crossing this road. Currently the multi-use trail connects to the signalized intersection at McAnally Drive and trail users return to the trail system to the east by using the sidewalk (Figure 11). A dirt trail and wooden bridge connect the gravel parking area in Mahany Park to Woodcreek Oaks in a direct crossing from this trail. However, if east-west through-traffic increases, there may be increased demand for a more direct at-grade mid-block crossing between Mahany Park and the eastern trail system across Woodcreek Oaks Boulevard. This crossing would require similar improvements to those described above for a Fiddyment Road crossing.

3.2.4 Restoration

There are currently many user-created dirt paths through the Study Area. Eliminating use of the trails by educating and redirecting users to the new paved trails with post and cable fencing and signage may be sufficient for some of the smaller trails to naturally revegetate without further intervention. However, due to the compacted soil and width of the larger trails, it may be necessary for more active restoration to be completed in some areas. Active restoration may include tilling the soil to reduce compaction and seeding with native plants. Any restoration activities should be completed in accordance with the OSPOMP.

Large dirt paths through the vernal pool complex should be restored.

3.3 TRAIL AMENITIES

Survey respondents expressed interest in a variety of improvements and amenities in addition to multi-use paved trails. Benches, trash cans, dog waste stations, and signage are all amenities requested by survey participants that are compatible with a trail through the open space preserve. Shade, safety lighting, and parking are amenities that should be considered in selected areas, but may not be appropriate additions throughout the Study Area. Some improvements suggested by survey participants, such as additional restrooms, drinking fountains, dirt mountain bike trails, and basketball courts are not recommended for inclusion in the project due to the Study Area's designation as an open space, its proximity to developed recreation facilities, and lack of utility

Existing bench along gravel access road near Woodcreek High School.

connections. The City may consider these improvements at other locations. All trail amenities should be designed in accordance with the current City Standards.

3.3.1 Benches

The results of both outreach surveys indicated a strong desire from the public for benches and other resting points along the trails. Design best practices recommend placing benches at approximately 1/4-mile intervals or a slow 10-minute walk along trails. Additionally, benches should be placed at points of interest to take advantage of good views or significant natural features and at trail intersections or other natural congregation points. Whenever possible benches should be placed to take advantage of shade provided by existing trees or include with a roof or canopy to provide shade.

3.3.2 Trash Stations

Providing trash cans is an important aspect of reducing littering within the open space preserve. The site is heavily used for walking dogs and is located near the dog park, so dog waste bag dispensers should be placed with trash cans, at trail entrances and intersections. They should be well-separated from benches, wayfinding, and interpretive signs to minimize noxious smells at stopping points.

3.3.3 Signage

3.3.3.1 Share the Trail Etiquette Guidelines

In 2010, staff from the Alternative Transportation, Engineering, Parks, Open Space, Police, Fire, City Attorney and Risk Management Departments/Divisions met to review the nature of complaints related to trail use, and trail etiquette guidelines from other jurisdictions.

Share the Trail Etiquette Guidelines resulted from this collaborative effort, along with consideration of trail behaviors and results from a widely circulated public opinion survey. Share the Trail Etiquette Guidelines are a detailed list of recommendations for trail users developed to reduce trail user conflict. The guidelines, which were incorporated into a “Share the Trail” sign and trail markings, are:

- Use the trail responsibly,
- Don’t block the trail,
- Keep dogs under control – 6’ leash maximum,
- Travel at a safe speed,
- Pass with care,
- Bicyclists keep right except to pass, and
- Pedestrians keep left to face oncoming bicyclists.

Trail Etiquette sign.

In addition to the signs and markings placed on the trail, Share the Trail education is communicated in the following ways:

- City website www.roseville.ca.us/sharethetrail.
- Video posted to websites, shown on COR-TV, shared on social media channels, in email newsletters, and at special events.
- Handouts distributed to the public at special events, on trails by Police Department representatives and City maintenance crews at parks, City facilities, and local bike shops.
- Parks, Trails & Bikeways Map.

In addition to the signs and markings developed for Share the Trail Etiquette guidelines, additional signage to inform trail users about sensitive habitats will be necessary and may include:

- Habitat Restoration Area – Stay on Trail
- Open Space Preserve – Stay on Trail
- Dogs Must be on Leash – 6' Maximum (Roseville Municipal Code 8.02.240)

Share the Trail Etiquette Guidelines and guidelines for preserving and/or restoring open space habitats and sensitive areas will be part of the final project design.

Informational trail signs and pavement markings.

3.3.3.2 Interpretive Signs

Interpretive trail signs provide self-guided education opportunities for trail users of all ages and abilities to develop a connection and appreciation for the surrounding landscape. Interpretive signs may describe the animals, plants, creeks, and plants that surround trails and can instill an appreciation of a natural habitat along with a renewed respect for preserving it and inspire people to make choices that preserve and improve their City. Due to the many natural resources, sensitive habitats, utilities and history in the study area, there is great potential for educational opportunities. Interpretive signs to educate and inform trail users should be developed and incorporated into trail design in coordination with the City's Utility Exploration Center, nearby schools and in coordination with the City's existing interpretive sign programs. Interpretive signage topics may include:

Example of interpretive sign.

- Natural habitats on site: Vernal pools, oak woodland, annual grassland, riparian woodlands, and the importance of open space preserves to plants and wildlife in an urban area.
- Plants and wildlife: Rare or unique species found here; what you can do to protect wildlife and keep it wild.
- Creeks and their watersheds: Water cycle and the watershed that runs through the City flows to the Sacramento River and ultimately to the ocean.

- Importance of your choices: How decisions made at home affects natural habitats and water quality.
- Storm water: Where does water go, how is it treated, what pollutants are a problem, how you can help keep storm water clean.
- Electrical power grid – Where to the lines run; how does the substation work, power line safety, renewable energy, what's that buzzing sound?
- Recycled water: How wastewater is handled, why this is a valuable resource, how you can help keep treatment costs low.

3.3.3.3 Wayfinding Signs

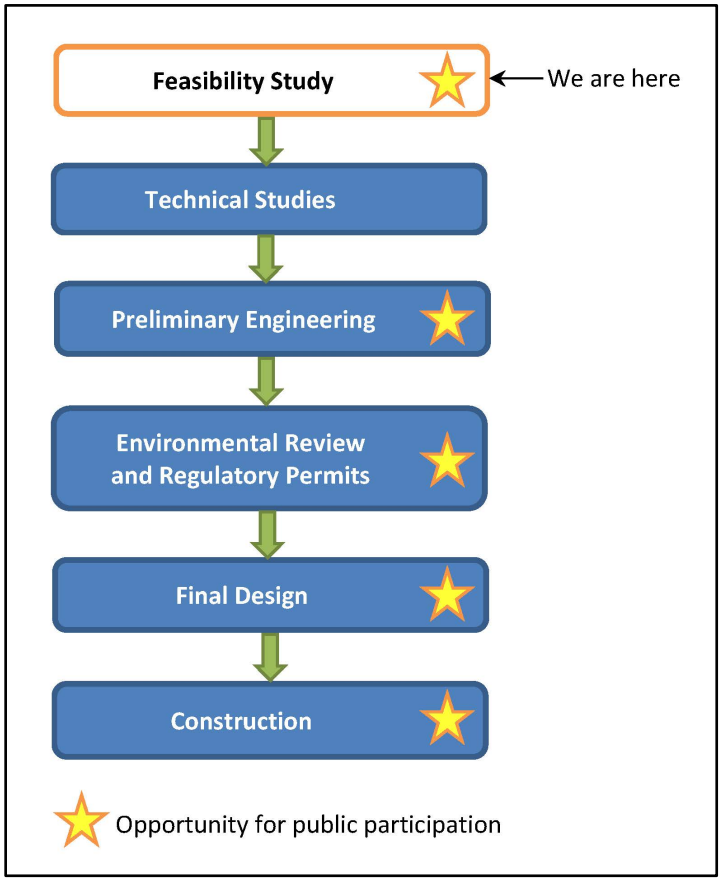
Wayfinding signs provide guidance to visitors to help them navigate the trail system. Site-specific wayfinding signs provide a map of the trail network within the Study Area and connections to local roads and the City's bikeway network. Wayfinding signs should be placed at major intersections within the Study Area and at the connections to trails that extend offsite.

3.3.4 Trees and Shaded Trails

In addition to the desire for shaded benches described above, many people expressed desire for more shade along the trails. Due to the proximity of overhead utility lines and vernal pools, adding trees is likely not feasible in the western half of the Study Area. There is some potential for tree planting in the eastern half of the Study Area outside of the utility easements. Any planting should be consistent with the OSPOMP which requires that only native species should be planted in the Study Area. Current guidelines restrict tree height to ten to fifteen feet at maturity, depending on the utility, within an electrical transmission line easement, so oak tree planting is not feasible on much of the Study Area. In areas where trees can be planted, they should be placed on the south or west side of the trail or bench for maximum shade impact. Planting for shade could also provide planting locations for mitigation oak trees, however this would require ongoing maintenance to ensure establishment of the mitigation trees. There is no irrigation connection currently available on the site, therefore mitigation planting would likely require hand watering for three to five years during establishment. The final determination of whether mitigation trees or other native landscape is installed will be made during preliminary engineering.

3.3.5 Lighting

Although often desired for security and to allow safe trail use at night, artificial lighting can also have negative effects. Artificial lighting at night may impact plants and wildlife by interfering with their natural circadian rhythms. Installing new lighting can also be disruptive to adjacent residents. Due to the Study Area designation as an open space preserve, lighting should be kept to the minimum required for safety and security. To further reduce impacts from artificial lighting, motion-controlled lights that brighten when a trail user approaches, should be considered. Solar-powered LED lights provide a viable option for installing lights in areas without an electrical supply. The exact type and location of lighting along the trail will be determined during preliminary engineering.



3.3.6 Parking

Although no new parking is proposed within the Study Area, there may be a need for additional parking if use of the Study Area increases. The majority of the existing public parking is at the east end of the Study Area at Mahany Park and the Roseville Aquatic Complex. There is no public parking on the west end of the Study Area. To provide parking facilities along Fiddyment Road, the City could investigate a joint use agreement with the CVS shopping center immediately north of the Study Area. There may also be sufficient space to develop off-street parking between Fiddyment Road and the electrical substation (Figure 13).

4.0 NEXT STEPS

This study represents the first step in constructing multi-use trails through the Study Area. Prior to construction, additional planning and design will be required. Responses received through the public engagement process indicated there is a strong for trail users and nearby residents to be kept informed and engaged in the next steps leading to trail construction. Additional opportunities for public input and participation will occur throughout the design process, as shown in Figure 15 and discussed in the appropriate sections below. Estimated costs for planning, design, and construction are included in Section 4.6.

Figure 15
NEXT STEPS*

* Dependent on funding

4.1 TECHNICAL STUDIES

Technical studies provide detailed information that are critical to design decisions and the environmental review process. Although a biological constraints report was prepared as part of this study, the report should be updated to reflect current conditions before environmental review for the project begins. Focused biological resource surveys and a formal aquatic resource delineation report may be required. Additionally, a cultural resources evaluation is expected to be needed. An assessment

of existing transportation conditions around the Study Area, which provided general recommendations for safety improvements to existing roads (see Section 3.2.3.2), was prepared for this study (Fehr and Peers 2020), however, additional in-depth traffic studies are required for development of mid-block crossings and site-specific recommendations. Geotechnical studies will also be required as a basis for engineering design of the creek crossings. These studies typically take two to three months to complete and should be done prior to the start of preliminary design, so study results and recommendations can be integrated into the design.

4.2 PRELIMINARY ENGINEERING

Design will begin with preliminary engineering, when the final alignment, trail materials, amenities, bridges, and overall project footprint will be determined based on project budget and City priorities. For this project, preliminary engineering will also include additional public outreach, particularly regarding connections with adjoining neighborhoods. As part of the preliminary engineering design requirements for the various utilities (WAPA, SMUD, PG&E, Roseville Electric, City sewer and storm water departments) should be confirmed. The decision to construct one or both of the recommended connections to Fiddyment Road will be made during this phase. Although costly, the mid-block crossing provides a direct connection to the City bikeway network and improved safety, which could help this project score higher in the competitive grant process. Preliminary engineering must be completed to facilitate environmental review and regulatory permitting. Preliminary engineering is expected to take three to six months.

4.3 ENVIRONMENTAL REVIEW

Although a trail through the Study Area has been conceptually reviewed in previous documents, a project specific environmental review will be required to ensure compliance with the California Environmental Quality Act (CEQA). This will include a public review and comment period. Based on the size and the potential environmental impacts of the project, an Initial Study will be necessary to determine if a Mitigated Negative Declaration will be appropriate, or if a more in-depth environmental review is necessary. If federal funds are used to construct the project, then a National Environmental Protection Act (NEPA) evaluation will also be required.

The environmental review process can begin once preliminary design is complete (see Section 4.5). However, if design changes later result in impacts outside of the project scope considered in the environmental review, a supplemental review may be required. The environmental review process for a project of this size typically take six to nine months to complete.

4.4 REGULATORY PERMITS

As discussed in Section 2.2, permits from the California Department of Fish and Wildlife, U.S. Fish and Wildlife Service, Regional Water Quality Control Board, U.S. Army Corps of Engineers, may be required prior to construction of any improvement that will impact a protected aquatic feature, habitat, or special-status species.

- CDFW: Since the project will construct trail through riparian habitat, a Lake and Streambed Alteration agreement will likely be required even if the creek crossings do not directly impact the channel. Additionally, if special-status species are discovered on site during the additional biological resource surveys an Incidental Take Permit may be required.

- USFWS: Since the proposed alignment directly impacts a vernal pool, coordination with the USFWS will be required. Additionally, if special-status species are discovered on site during the additional biological resource surveys an Incidental Take Permit may be required.
- RWQCB: Since the proposed alignment directly impacts a vernal pool, a permit from this agency will be required. This permit will also cover any project impacts to areas within the creek channels.
- USACE: If the bridges are designed to avoid all impacts to jurisdictional waters by spanning the channel completely and existing regulations are still applicable, no permit from this agency is anticipated to be required.

The regulatory permit process may take six months to a year, or longer, depending on the type and extents of resources impacted. This process can be started concurrently with the environmental review process at the time a stable project description and adequate design information is available, but the CEQA or NEPA documents must be complete prior to the issuance of regulatory permits. Each permit will likely include mitigation requirements that should be integrated into the final construction documents. The costs and benefits of avoiding impacts to jurisdictional features should be evaluated during the preliminary design phase of construction documents to determine the best project design.

4.5 FINAL DESIGN

Following completion of the preliminary engineering, environmental review and regulatory permitting, full construction documents consisting of plans, specifications, and estimates will be prepared in accordance with City Standards. The construction documents will include information on trail alignment and design, site grading, creek crossings, benches/rest areas, signage, connections to existing trails, midblock crossings, and any other improvements included in the project such as parking, planting, or lighting, as well as measures for protection of sensitive habitats and erosion control measures. Improvement plans must be submitted to WAPA and SMUD independently for approval prior to construction. Review of plans in relation to Roseville Electric, sewer, and water will be completed as part of the standard City plan review process. The City will include public review and comment opportunities in the plan review process. The final design process typically requires nine months to a year to complete. Environmental review and regulatory permitting should be completed prior to the completion of final construction documents so that appropriate avoidance and mitigation measures can be integrated into the project.

4.6 CONSTRUCTION

Although construction will be primarily completed by a contractor, there are opportunities for community involvement, including installation of benches, dog waste stations, small community-built bridges, or tree planting. Additionally, there may be opportunities for community members to “adopt” a creek or trail segment following construction. Construction is anticipated to be completed in approximately 6 months, but the schedule will depend on weather conditions and the details of the final design. The cost to construct the trail will depend on which paving materials are selected, the extent of expanded shoulders, site amenities, and materials costs at the time of construction. Overall, the construction cost of the trail is expected range between approximately $275 per linear foot, if standard asphalt and shoulders are used, to $460 per linear foot, if pervious materials and expanded shoulders are selected.

Table 2
CONSTRUCTION COST ESTIMATE

Item	Quantity	Unit	Unit Price	Total Cost
Paved Trail	12,625	LF		
Standard Asphalt			$30	$378,750
Pervious Asphalt			$60	$757,500
Standard Concrete			$130	$1,641,250
Pervious Concrete			$190	$2,398,750
Decomposed Granite Shoulder	12,625	LF		
Standard 2’ width			$27	$340,875
Expanded 4’ width			$54	$681,750
Aggregate Base Shoulder	12,625	LF		
Standard 2’ width			$2.50	$31,563
Expanded 4’ width			$5	$63,125
Striping	12,625	LF	$9	$113,625
Post and Cable Fence	25,250	LF	$30	$757,500
Bridges (3 total)	1	EA	$250,000	$250,000
Rest node	11	EA	$6,500	$71,500
Trash Station		EA	$3,800	$41,800
Informational Signs	20	EA	$300	$6,000
Interpretive/Wayfinding Signs	15	EA	$1,400	$21,000
At-grade mid-block crossing	1	EA	$350,000	$350,000
Miscellaneous Construction Costs				$1,100,000

The estimates shown in Table 2 are based on the following City design standards and assumptions:

- Paved trails are ten feet wide.
- Standard asphalt paved trail includes two inches of asphalt over four inches of Class II aggregate base.
- Pervious asphalt paved trail includes three inches of pervious asphalt over six inches of pervious base.
- Standard concrete paved trail includes four inches of concrete over four inches of Class II aggregate base.
- Pervious concrete paved trail includes four inches of pervious concrete over six inches of pervious base.
- Aggregate base shoulder is four inches deep. (2 feet wide per City Standard, additional cost for wider shoulders).
- Decomposed granite shoulders are 3 inches deep and stabilized with organic binder. (2 feet wide per City Standard, additional cost for wider shoulders).
- Bridges include two 20-foot long and one 30-foot long, 10-foot wide metal pre-fabricated bridge with concrete abutments. The cost for a pipe culvert for the swale crossing is included in miscellaneous construction costs.
- Rest node includes City Standard bench installed on 5’ x 11’ three-inch deep decomposed granite pad, and standard 4’ x 12’ fabric shade shelter.

- Trash Station includes and trash can with dog waste bag dispenser installed on 5’ x 5’ three-inch deep decomposed granite pad.
- Interpretive and wayfinding signs will be 24” x 36”, mounted on a standard single-post pedestal. Costs of signs includes 6’ x 6’ three-inch deep decomposed granite pad.
- Miscellaneous construction costs for items not specifically included in table, such as mobilization, grading, and erosion control, is estimated as the median of 30% of itemized costs.

4.7 FUNDING

As shown in Table 3, the total estimated cost to implement the complete project is between $4.3 million and $6.7 million. This includes approximately $865,000 for planning, permitting, and design and $3,400,000 to $5,800,000 in construction costs, depending on materials.

Table 3
IMPLEMENTATION COST ESTIMATE

Step	Estimated Cost
Technical Studies	
Biological Resources Assessment and Special-Status Species Surveys	$16,000
Aquatic Resource Delineation	$10,000
Cultural Resources Assessment	$12,000
Traffic Study	$40,000
Geotechnical Study	$20,000
Preliminary Engineering	$60,000
Public Engagement	$85,000
Environmental Review[1]	
CEQA Document	$40,000
NEPA Document Support[1]	$25,000
Regulatory Permits[2]	
CDFW SAA	$9,000
RWQCB Permit	$8,000
USFWS Consultation	$12,000
Mitigation Fees[3]	$30,000
Final Design	$500,000
Construction	$3,430,000 - $5,820,000
Total Project Cost	$4,297,000 - $6,697,000

[1] Assumes Caltrans or other lead agency prepares NEPA document with technical study support from applicant.
[2] Assumes crossings fully span creeks, one vernal pool is directly impacted, and no additional special-status species identified in technical studies. Actual regulatory permits required will depend on project design and regulatory requirements at the time.
[3] Assumes 5:1 mitigation for impacts to 0.02 acres of vernal pool at rate of $300,000 per acre and any impacts to riparian habitat will be mitigated on site as part of project design. Actual mitigation requirements will be determined as part of the regulatory permitting process.

Funding has not been identified for the next steps required for trail construction. If directed by City Council, staff will pursue funding through various competitive federal, state, and regional grant programs and local sources over the next several years to complete the project. General Fund and Measure B funds are not used for multi-use trail construction. Transportation, sustainability, and recreation-related grants are typically funded through annual appropriation bills, bond measures, or fee

programs. Some programs are cyclical, with additional rounds of funding becoming available over time, while other programs end once their funds are distributed. Lists of potential grant opportunities are listed on the State of California's website (www.grants.ca.gov) and Sacramento Area Council of Governments (SACOG) website (https://www.sacog.org/statewide-funding-opportunities). Grant applications are typically competitive and eligible projects, application requirements, and scoring criteria may change over time as grant funding is renewed. Potential funding sources that may be pursued for this project include:

- Active Transportation Program (ATP) – The goal of this state program is to increase biking and walking trips, improve safety and mobility of non-motorized users, reduce greenhouse gas emissions, and enhance public health. ATP funds are administered through Caltrans and SACOG. No matching funds are required.
- Recreation Trails Program (RTP), non-motorized trails – This federally funded program is administered through the California Department of Parks and Recreation Office of Grants and Local Services. This grant program requires that the applicant match at least 12% of the total project cost. Eligible projects must be listed on the state or local transportation improvement plan. This program is currently only funded through fiscal year 2020.
- Affordable Housing and Sustainable Communities Grant Program – This program administered by the California Strategic Growth Council funds projects that allow residents to drive less by making sure housing, jobs, and key destinations are accessible by walking, biking, and transit. This program requires matching funds.
- Congestion Mitigation and Air Quality (CMAQ) Program – This program is funded by the Federal government and administered locally by the Placer County Transportation Planning Agency (PCTPA). The purpose of the program is to fund transportation projects designed to reduce traffic congestion and improve air quality.
- Transportation Development Act (TDA) – This program creates the Local Transportation Fund with revenue derived from ¼% of the state retail sales tax. These funds may be used for a wide variety of transportation projects, including bicycle and pedestrian facilities.
- Habitat Conservation Fund – This state grant program is administered through the California Department of Parks and Recreation Office of Grants and Local Services. Eligible projects include nature interpretation programs to bring urban residents into park and wildlife areas and protection of various plant and animal species. Matching funds are required.
- Wildlife Conservation Board Public Access Program – This program is administered by the Wildlife Conservation Board with the goal to increase public access to wildlife-oriented activities, including ADA trails, interpretive signs, and bird observation areas.
- Habitat Enhancement and Restoration Program – This program run by the California Habitat Conservation Board funds projects that provide assistance for the restoration and enhancement of fish and wildlife resources. No matching funds are required.
- PeopleForBikes Community Grant Program – This program, funded by the non-profit PeopleForBikes, supports bicycle infrastructure projects that make it easier and safer for people of all ages and abilities to ride. The grant limit is $10,000 and matching funding is required. This grant is typically directed to community-based non-profits for smaller projects.

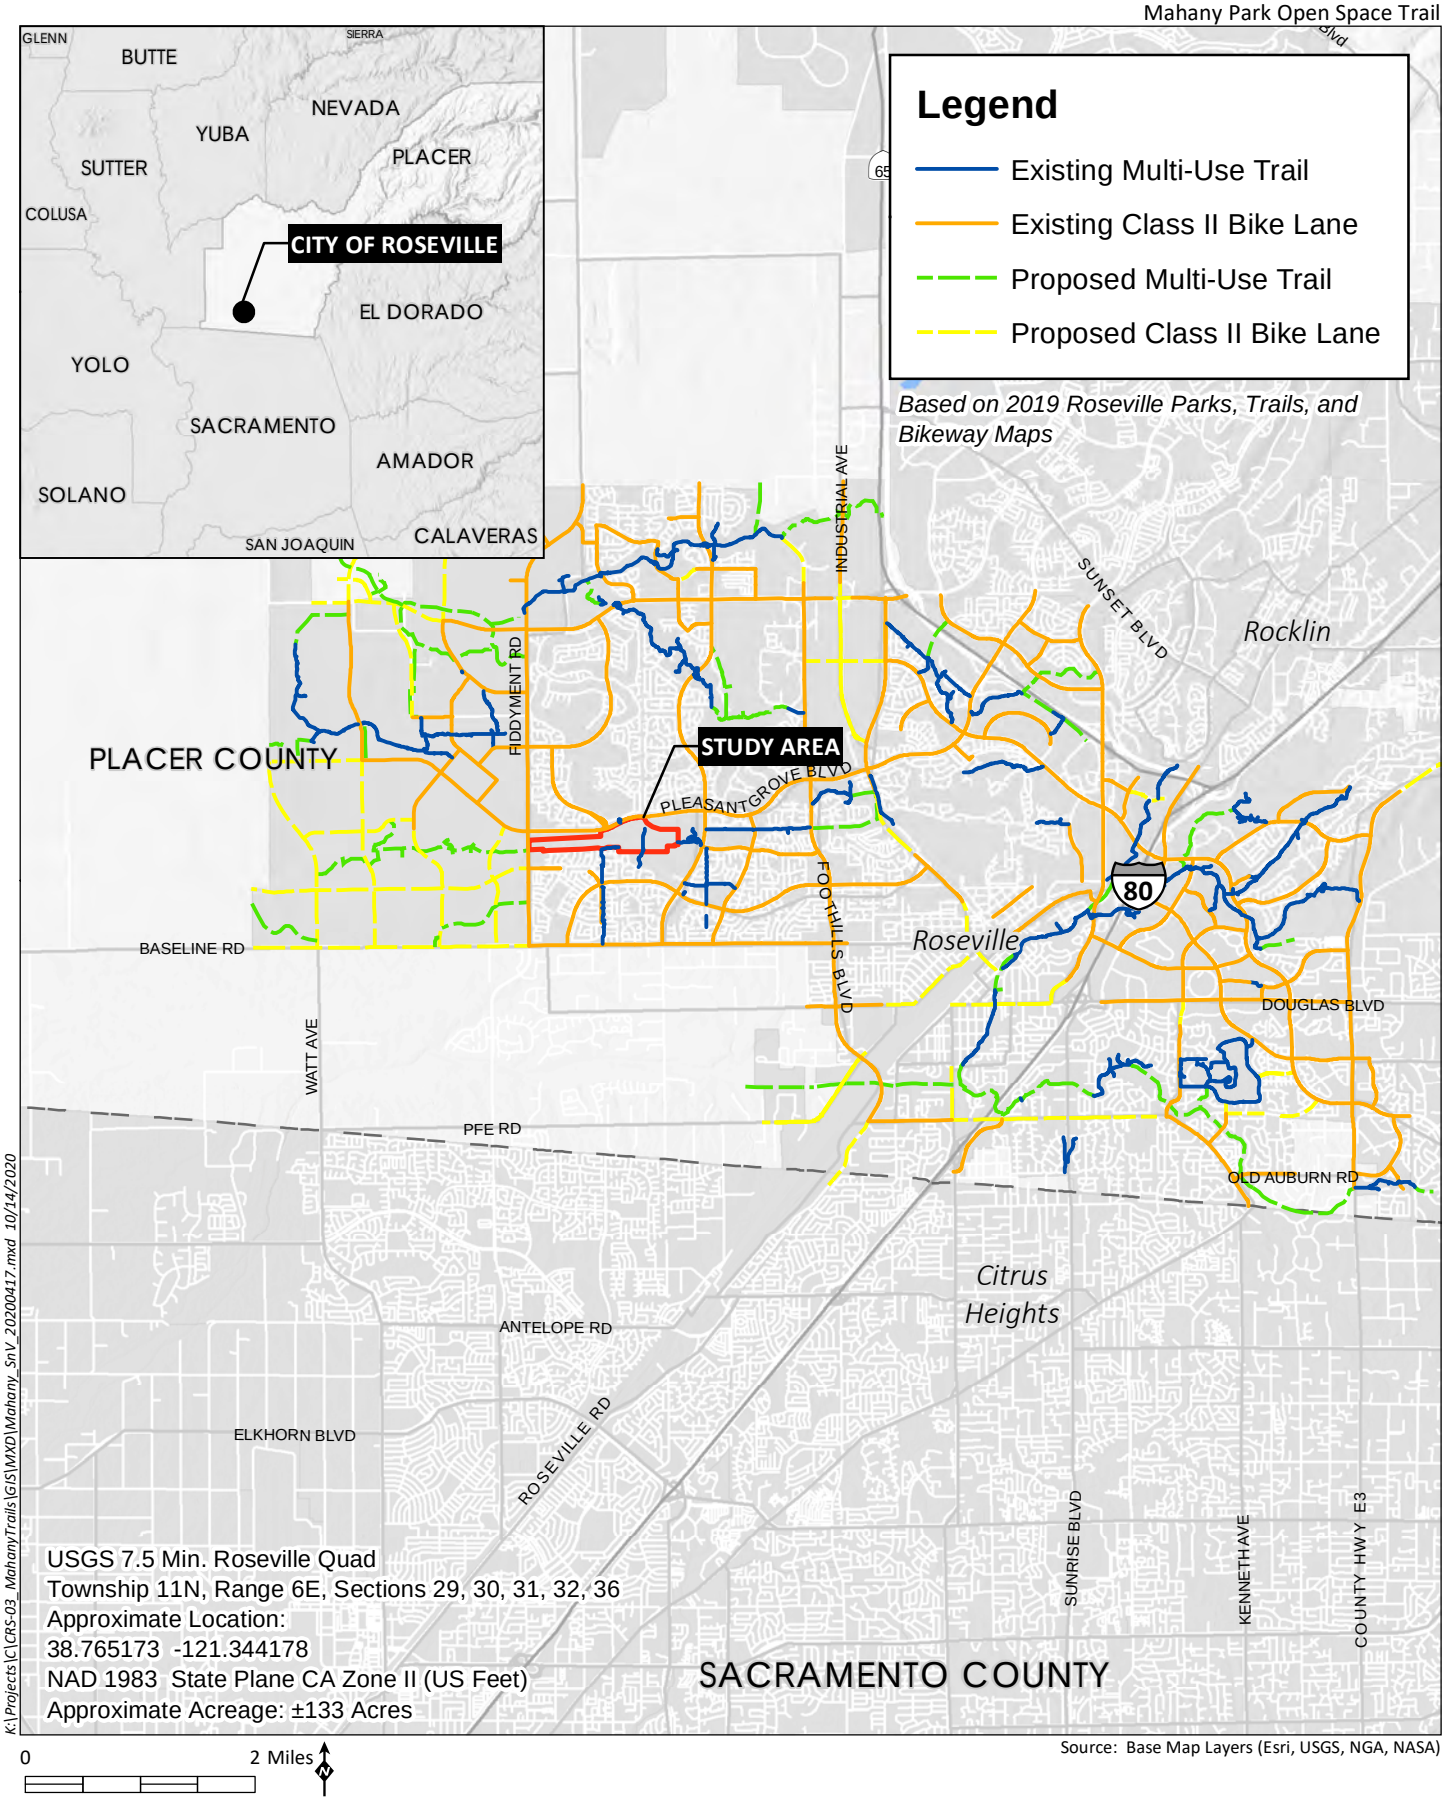
1.0 INTRODUCTION

The purpose of this report is to document the existing conditions of the Mahany Park Open Space (Study Area), document design opportunities and constraints, and provide a summary of applicable design guidelines. This report will inform the development of conceptual alignments of Class I trails and related recreational amenities, which will be documented in the Mahany Park Open Space Trail Feasibility Report. The Study Area is located in western Roseville, California, amidst residential and commercial developments. Its location adjacent to Mahany Park, the Roseville Aquatics Center, and Woodcreek High School make it an important access corridor for students and families. Although existing paved, multi-use trails connect to the site at four locations, there are no complete paved trails through the Study Area. Connections between the paved trails have been created by users over time in the form of dirt paths. These dirt paths often cut through wetlands or drainages and they may be impacting the natural resources that the Open Space was established to protect. Design of improvements within the Study Area must comply with guidelines established in multiple City of Roseville documents, federal and state resource agency regulations, and requirements of the utilities who have established easements and facilities within the Study Area.

The existing conditions of the Study Area were evaluated by a HELIX Environmental Planning, Inc. (HELIX) landscape architect and landscape planner on March 5, 2020. During this site visit, opportunities, such as good views and interesting natural resources, approved improvements, such as utilities, gates, signs, and paved trails, unapproved improvements, such as user-created dirt paths, bridges, and dirt bike jumps, were mapped and photo-documented. This information, combined with applicable design constraints will be used to develop options for trail alignments and other improvements to the Study Area to improve connectivity and safety, and reduce impacts to sensitive natural resources.

2.0 STUDY AREA BACKGROUND



2.1 LOCATION

The Study Area is owned by the City of Roseville and encompasses APNs: 017-370-007, 014, 015; 017-162-077, 079, 080; 477-110-005; and the western edge of 017-370-006 (City of Roseville 2020b). It is located in western Roseville between Fiddyment Road and Woodcreek Oaks Boulevard, south of Pleasant Grove Boulevard (Figure 1).

2.2 LAND USE AND ZONING

The majority of the Study Area is zoned as open space and it is more specifically defined as open space preserve in the Roseville Open Space Preserve Overarching Management Plan (OSPOMP). A small area in the southeast corner of the Study Area is general open space. The remainder of the Study Area is zoned as Park and Recreation (City of Roseville 2017). The Study area is split between the North Roseville Specific Plan area, which includes the western half of the site, the Northwest Roseville Specific Plan area on the east, and the Del Webb Specific Plan area to the north. The Sierra Vista Specific Plan is located to the west of the Study Area and the West Roseville Specific Plan Area is located northwest of the Study Area (Figure 2). The site is crossed by multiple utility easements containing both large electrical transmission lines and standard electrical utility poles.

The predominant land use surrounding the Study Area is residential. The Study Area ends at Fiddyment Road on the west, beyond which are planned commercial and residential areas that are currently being developed. Immediately adjacent to the Study Area on the north is commercial development, high-density housing, and a senior assisted-living facility, beyond which is Pleasant Grove Boulevard. Beyond Pleasant Grove Boulevard to the north and northwest are active adult single-family residential communities. To the northeast and east of the project area is Mahany Park, a regional park that includes the Martha Riley Library, the Utility Exploration Center, Bear Dog Park, and the Sports Center; the Roseville Aquatics Complex; and Woodcreek High School, beyond which is Woodcreek Oaks Boulevard. The eastern end of the southern boundary of the Study Area abuts the Silverado Oaks Urban Preserve and the western half is bounded by single family residences.

2.3 PLANNING POLICIES

2.3.1 Roseville Open Space Preserve Overarching Management Plan

The Roseville Open Space Preserve Overarching Management Plan provides a universal approach and specific goals for open space management, maintenance, and monitoring in all City open space and replaces individual management plans written for each open space as they were established. The OSPOMP recognizes the need for maintenance, installation, and replacement of City facilities, including bike trails and maintenance roads, while requiring that the City will protect biological resources from unpermitted impacts. The OSPOMP was approved by the U.S. Army Corps of Engineers (USACE), and the U.S. Fish and Wildlife Service (USFWS). As part of their approval of the document, the USFWS issued a biological opinion that covers limited amounts of direct and indirect impacts to vernal pools as part of allowed maintenance activities. City facility maintenance, replacement, or modification that causes ground disturbance within 250 feet of listed vernal pool invertebrate habitat is considered to be having indirect impacts. Maintenance activities that exceed these limits and installation of new facilities are not covered under the OSPOMP biological opinion and will require additional consultation with the USFWS. Additionally, consultation with wildlife agencies is required if the work is not covered by the OSPOMP biological opinion or the endangered/threatened species habitat is under the jurisdiction of NOAA Fisheries/NMFS.

Chapter 9 of the OSPOMP includes a discussion of bike trails and related amenities, such as benches, signs, and trash cans. Bridges and riparian crossings are not specifically discussed in the OSPOMP. While existing trails were either permitted and installed as part of the development requiring an Open Space Preserve or were permitted separately as their own project within the General Open Space, new trails shall be installed and maintained in accordance with the Bicycle Master plan and the OSPOMP. Conceptual alignments for new trails within the Study Area were included in the OSPOMP, but coordination with the appropriate State and Federal Agencies for approval of the final alignment will be required prior to construction.

The OSPOMP defines the two types of open space management areas: open space preserve and general open space, jointly referred to as open space. Areas designated as open space preserve is land that was required to be set aside as part of a regulatory permitting action and is typically protected by either a conservation easement or declaration of covenants and restrictions. Sensitive biological resources, such as jurisdictional waters or legally-protected species, are typically located in open space preserves. Off-trail public access in open space preserves is prohibited. General open space is the remainder of the City's open space and is not subject to State or Federal permit-related restrictions. As previously described, the majority of the Study Area is classified as open space preserve, with a small area in the southeast corner of the Study Area classified as general open space (Figure 2).

In addition to annual monitoring and maintenance requirements, the OSPOMP provides specific minimization and avoidance measures for restoration or correction of vandalism both inside and outside of vernal pools and bike trail maintenance and replacement. It also includes restoration guidelines for a variety of other conditions, some of which have occurred in the Study Area, including disturbance of grassy upland areas, accidental fill of wetlands/waters of the U.S., restoration of fencing and signage, correction of erosion, removal of graffiti and vandalism, undesignated (social) trails, un-permitted bike jumps/tracks, and landscaping/gardens. Implementing any of these restoration measures would be considered maintenance and are permitted under the existing biological opinion.

The OSPOMP includes recreation goals and accompanying actions that may be related to the installation of trails within the Study Area include. These goals and related actions are detailed below and should be incorporated into the design of improvements within the Study Area:

- Goal 11-1: Encourage appropriate use of the City's Open Space by providing bike trails and overlook points.
    - Action 11-1-1: Provide a connected paved bike trail system through the City's Open Space, avoiding trails through sensitive habitats such as vernal pool grassland.
    - Action 11-1-2: Provide bike trails with adequate width, grade, visual clearance, and surface materials to provide safe passage for anticipated users of all abilities.
    - Action 11-1-3: Provide safe access to designated overlook points in a limited number of appropriate locations.
- Goal 11-2: Install fencing adjacent to trails and overlook points to reduce off-trail traffic and protect visitors.
    - Action 11-2-1: Install fencing adjacent to trails and overlook points where it is not currently in place.
    - Action 11-2-2: Maintain current and future fencing.
    - Action 11-2-3: Reclaim social trails and eliminate access to entry points within Open Space Preserve areas. Within General Open Space, reclaim social trails only if the Open Space Manager determines they are negatively impacting Preserve resources.
    - Action 11-2-4: Monitor/map significant recreational impacts on resources and determine how to avoid continued impacts.
- Goal 11-3: Discourage Vandalism and other unwanted activities by taking a comprehensive approach to enforcement that includes signage, patrols, and a telephone hotline for reporting violations.
    - Action 11-3-1: Regularly patrol the City's Open Space.
    - Action 11-3-2: Install consistent Open Space signage that is constructed out of materials that are not easy to damage.
    - Action 11-3-3: Provide a telephone number where residents can report suspicious or illegal activities.
- Goal 11-4: Enforce restriction on off-trail, off-leash dogs to protect biological resources.
    - Action 11-4-1: Educate residents regarding City leash laws.
    - Action 11-4-2: Enforce leash laws.
- Goal 11-5: Monitor recreation uses within the Open Space.
    - Action 11-5-1: Determine if recreational uses are having an impact on biological resources within the open space.
    - Action 11-5-2: Determine if residents are using the recreation opportunities by conducting formal or informal surveys.

- Goal 11-1 [*sic*]: Encourage safe and appropriate use of the City's Open Space by schools conducting environmental education (City of Roseville 2011).
    - Action 11-1-1: Provide guidance to teachers desiring to utilize the open space for educational purposes.
    - Action 11-1-2: Ensure that educational uses are safe and do not adversely impact biological resources.

2.3.2 City of Roseville General Plan

The relevant sections of the City's General Plan are the Circulation, Open Space and Conservation, and Parks and Recreation elements. These elements focus on the preservation and enhancement of the open space and trail networks and recognizes that there is a balance between habitat protection and public use.

The Circulation element includes goals and policies to develop a balanced transportation system for automobiles, transit, bicycles, and pedestrian. It defines Class I Bike Paths as paths that "that provide a completely separated right-of-way designated for the exclusive use of bicycles and pedestrians with crossflows by motorists minimized. Class I paths often follow natural amenities such as creeks, drainage, or utility line easements, and are used by both commuter and recreational riders." (III-50). Through goals, policies, and implementation measures it encourages a network on bicycle infrastructure and the implementation of the Bicycle Master Plan. Figure III-6 "Bikeway System", which does not differentiate between existing and planned bikeways, identifies the main east-west and north-south informal paths within the Study Area as Class I trails.

The Open Space and Conservation Element states its overall goal to, "preserve a comprehensive interconnecting system of open space, encompassing preservation and enhancement of natural habitat and significant resource areas for the use, appreciation, and enjoyment of the community." (V-2) This element specifically encourages through its goals, policies, and implementation measures the preservation and connection of open spaces and providing public education and access wherever compatible.

The Parks and Recreation Element specifically discusses open space lands and how they have recreational value for both active and passive use. They encourage improvements such as bike trails, signage, and pedestrian pathways. Within open space areas, this Element provides the following criteria:

- Locate improvements consistent with the Open Space Element;
- Provide access to open space areas except those areas sensitive to human presence;
- Provide an interconnecting system of open space corridors consisting of both public and private open space and, where feasible, incorporate bikeways and pedestrian paths, interpretive signage, etc.;
- Highlight unique or special features into the open spaces, such as cultural heritage, historical features, etc. through outreach, educational kiosks, interpretive signs, etc.;
- Consider regional linkages between open space and adjacent communities; and

- Private open space may be required to include public access for purposes of recreation and implementation of the City of Roseville Bicycle Master Plan, Pedestrian Master Plan or other adopted planning documents (City of Roseville 2016).

While the General plan does not provide detailed design guidelines, any proposed improvements in the Study Area must be consistent with the policies established in the General Plan.

2.3.3 City of Roseville Bicycle Master Plan

The Bicycle Master Plan was developed within the context of the Circulation Element of the City's General Plan. It is intended to guide bikeway policies, programs and development standards to make bicycling in Roseville more safe, comfortable, convenient, and enjoyable for all bicyclists. The ultimate goal of this effort is to increase the number of persons who bicycle in Roseville for transportation to work, school, and errands, and for recreation.

The Bicycle Master Plan includes plans for a Class I bike trail system. Consistent with the General Plan, Class I bikeways are intended for use by bicyclists, pedestrians and other non-motorized users. Equestrians are prohibited from using Class I bikeways in Roseville, but Class I bike trails are sometimes used as maintenance and emergency vehicle access within open space. The Bicycle Master Plan encourages the implementation of associated facilities such as bicycle parking, mile markers and destination guide signs, and trail maps at trailheads.

The Bicycle Master Plan identifies four instances of existing Class I bikeways that terminate at or in the Study Area that end with no connection, as described in Section 3.6.2. It proposes an additional 0.71 mile of Class I bikeways within Mahany Park Open Space, consisting of a north-south trail connecting the existing bikeways and an east-west trail from Mahany Park to Fiddyment Road (City of Roseville 2008).

2.3.4 Specific Plan Areas

As shown in Figure 2, the Study Area overlaps three specific plan areas and is directly adjacent to a fourth area currently under development. Although each specific plan document includes design requirements for trails, the current City standards, discussed in Section 4, take precedence.

2.3.4.1 Del Webb Specific Plan

The Del Webb Specific Plan (DWSP) sets forth regulations, conditions, and programs for 1,200 acres to develop an active adult community. Included in the DWSP is the ~14-acre northern parcel of the Study Area which is defined as a City-Wide Park (Figure 2). The DWSP discusses bike and pedestrian paths, showing a planned 10-foot wide bike path from the Pleasant Grove Boulevard undercrossing and extending first south, and then splitting to extend east and west. The east extension is intended to connect the park system and City-wide bike trail system. The west extension is intended to connect the south side of Pleasant Grove Boulevard. Within parks, the DWSP requires the paths be 8 to 10 feet wide; constructed of concrete or asphalt; and aligned to consider topography, landscaping, existing trees and wetlands, street lighting, and adjacent land uses. The DWSP identifies trees and wetlands within the Study Area and recognizes the importance of enhancing and monitoring them (City of Roseville 1993).

2.3.4.2 Northwest Roseville Specific Plan

The Northwest Roseville Specific Plan (NWRSP) guides development in the eastern half of the Study Area. It defines the four eastern parcels of the Study Area as open space and park. The NWRSP discusses bikeways and pedestrian pathways, showing a bikeway traveling through the eastern half of the preserve, but it does not show how the bikeway will terminate or connect to anything to the west of the specific plan area. The NWRSP establishes Class I bikeways shall be a minimum of 8 feet wide and not meander more than the distance of its width over a 100-foot run; not exceed a 5% slope; and shal be constructed of concrete if the bikeway is to double as a pedestrian path.

The NWRSP describes a 375-foot wide power line easement that runs east-west across the plan area and includes the Study Area and specifies that the easement is to include a pedestrian/bike path. The NWRSP also speaks to the importance of protecting and maintaining open space, vernal pools, and oak woodland (City of Roseville 1989).

2.3.4.3 North Roseville Specific Plan

The North Roseville Specific Plan (NRSP) is a comprehensive plan to guide the urbanization of 1,552 acres and complete the land-use and infrastructure planning for the associated area of the City, including Neighborhood D, which contains the western half of the Study Area. The NRSP includes in the land use map the three parcels which make up the western half of the Study Area. The narrow open space parcels along the north and south boundaries of the Study Area are 'Open space - vegetation buffers' while the large parcel through the center is 'Open Space - wetland compensation'. In Section 4.3, the NRSP discusses bike and pedestrian pathways, calling them out as 14' typical, but variable within open spaces. The associated figure shows no bike path within the Study Area but does show the trail stub that currently dead ends at the south side of the Study Area and specifically notes that it be connected to the City-wide trail system.

Included as an appendix to the NRSP is the North Roseville Design Guidelines (NRDG), which specifies open fencing along the open space perimeters and requires that pathways be defined within open spaces unless otherwise required by the wetland permitting authority. According to the design guidelines, open fencing must meet the following requirements: be 4 to 6-feet in height and construction of tubular steel, mesh, or wrought iron; mesh fencing shall be black vinyl-coated, with painted black posts and top rail; open fence or wooden posts with a cable strand connecting them may be used on the street adjacent to the open space (City of Roseville 1997).

2.3.4.4 Sierra Vista Specific Plan

Although the Study Area is not located within the Sierra Vista Specific Plan (SVSP), it is useful to consider this area to help ensure continuity in the trail network. The SVSP establishes a land use and regulatory framework to guide development of the approximately 2,075-acre Plan Area located to the west of Fiddyment Road and north of Baseline Road. The SVSP is immediately west of the Study Area and one of its project objectives is to "provide connections through the community in the east-west direction …via a system of open space, paseos, and Class IA bikeways." An east-west Class I bikeway is proposed in the Plan Area which stops just across Fiddyment from the southwest corner of the Study Area. The land immediately west of the Study Area, which this bike path is to travel through, is defined as a community commercial/business professional land use. The SVSP establishes the following guidelines for bike paths: the Class I system within an open space may meander to minimize environmental impacts and create

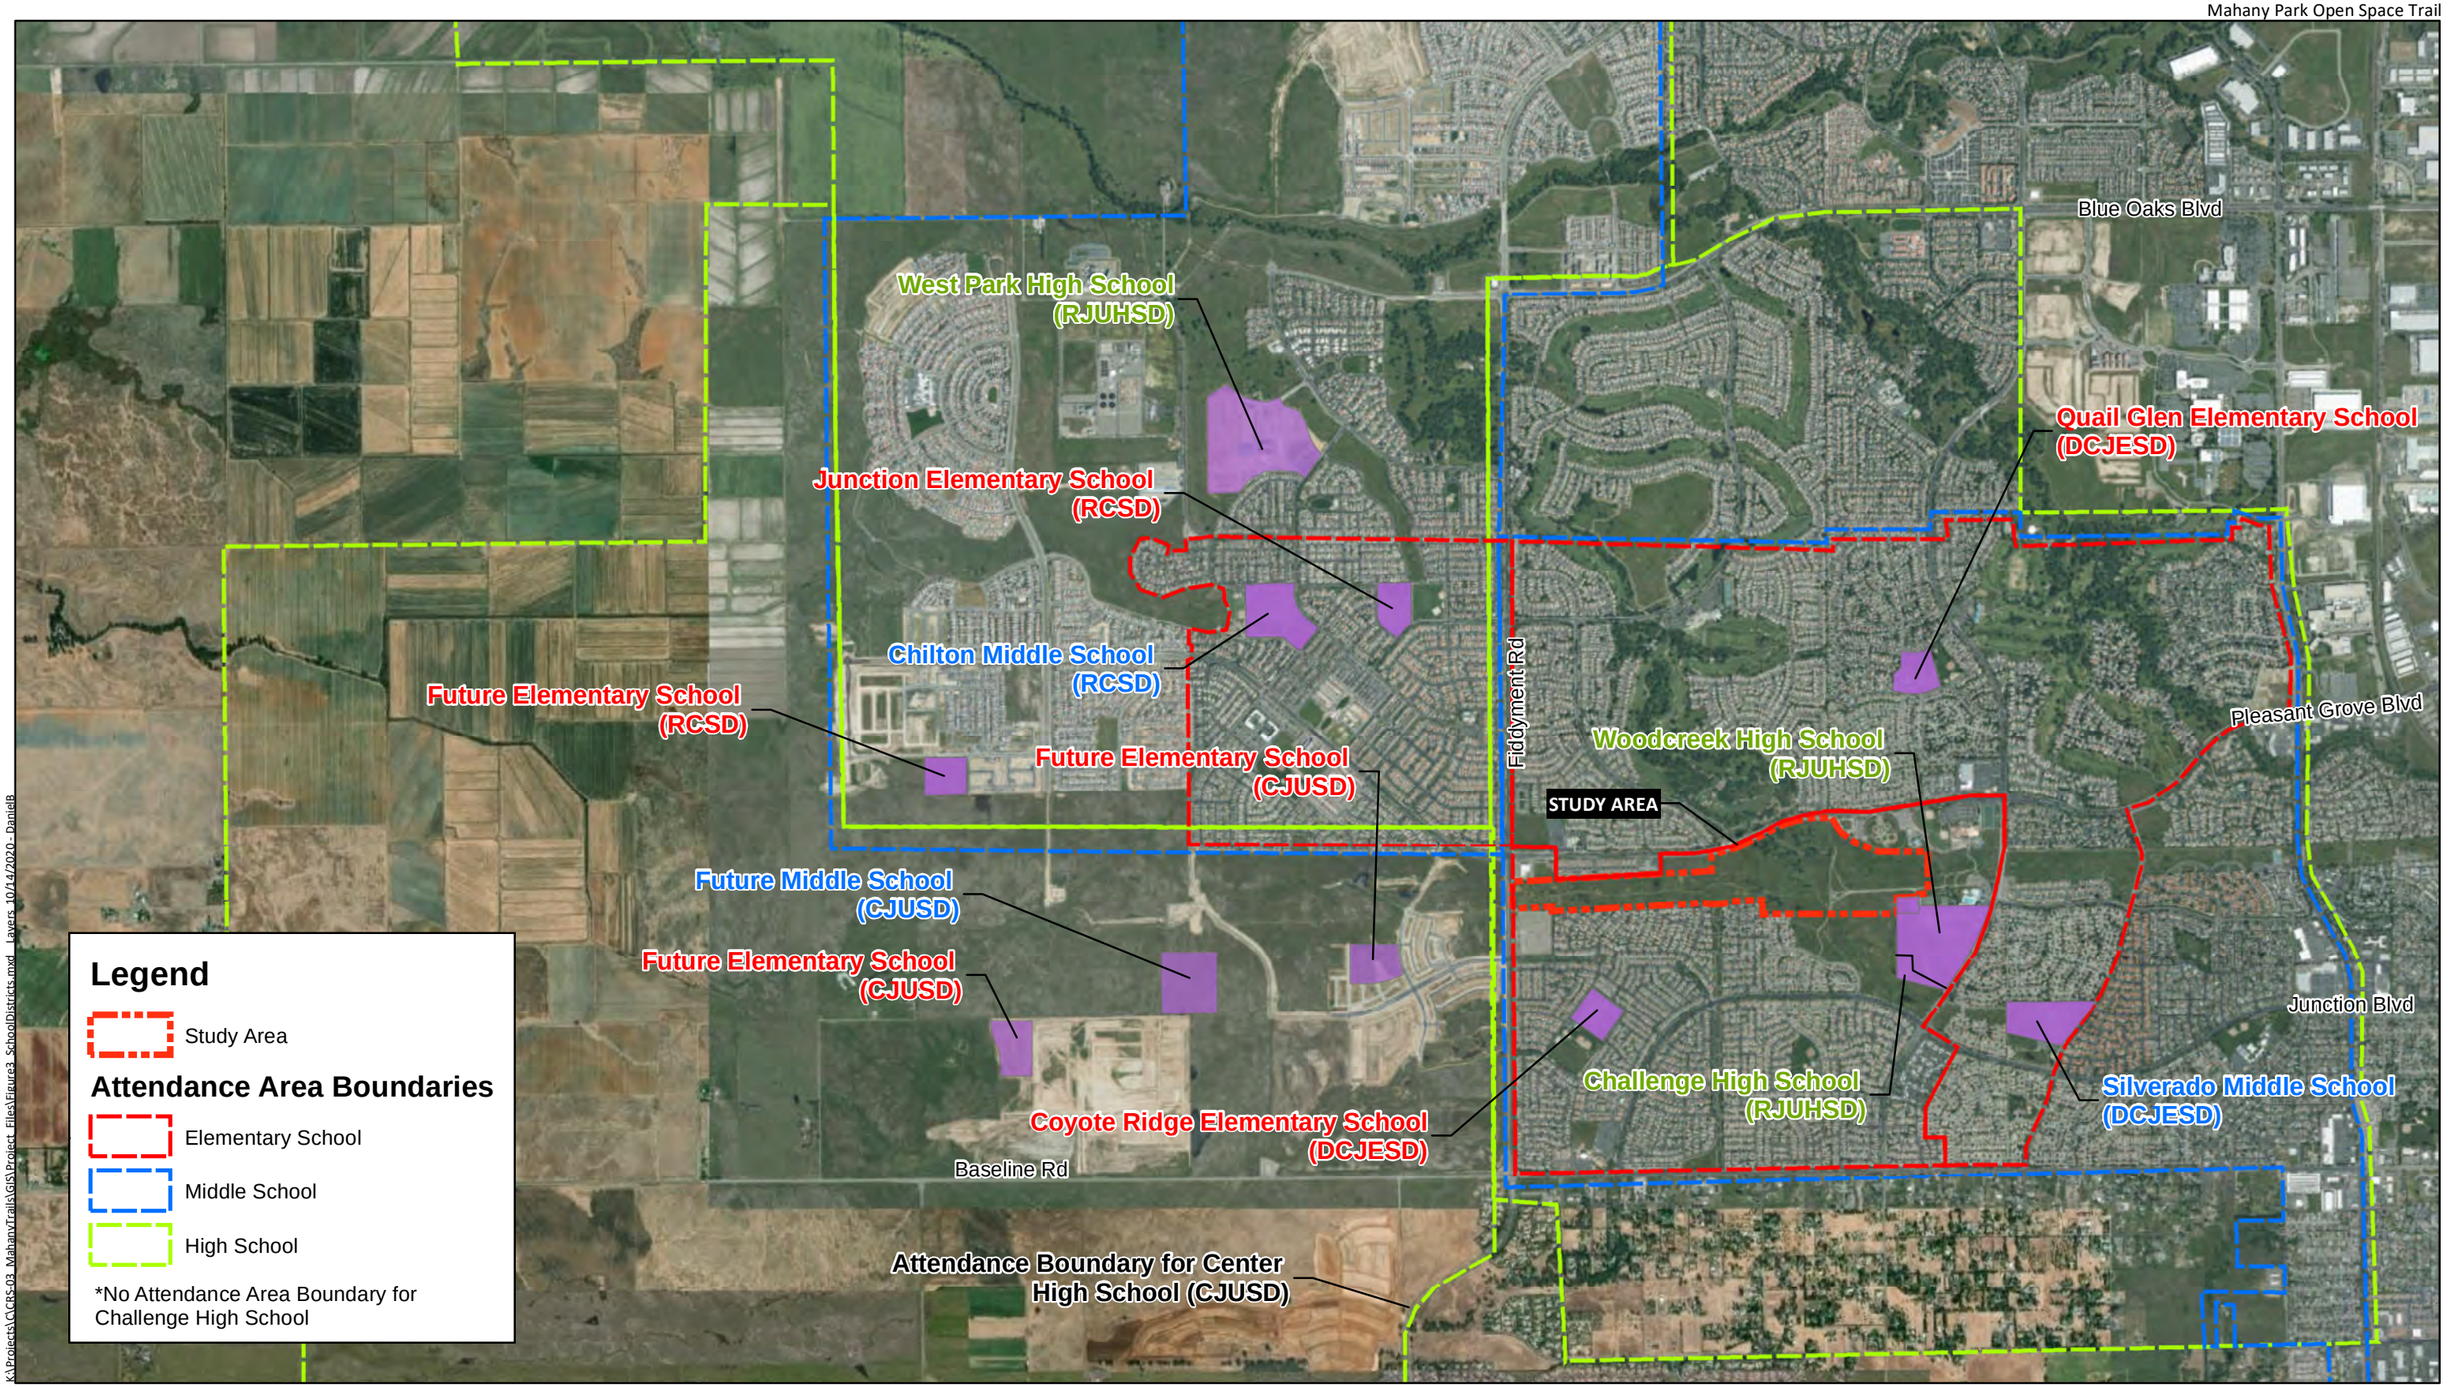
visual interest; bike paths should have 10 feet of pavement with lane striping, plus a 2-foot decomposed granite/gravel shoulder on each site; and barriers will be provided along bike paths to separate the pathways from the open space preserve areas. Barriers can be bollards, rail fence, vertical curbs, post and cable, posts, etc. as long as it complies with the associated Section 404 permit.

There is additional discussion of appropriate at-grade street crossings where Class I path intersects at or near signalized intersections. Recommended traffic control measures for crossing collector or residential streets may include ramps, botts dots (reflective raised markers), striping, or signage. No specific guidance on crossing Fiddyment Road or connecting to the Study Area is provided in the SVSP (City of Roseville 2010).

2.4 SCHOOLS

There are four public school districts in the vicinity of the Study Area: Roseville Joint Union High School District (RJUHSD), Dry Creek Joint Elementary School District (DCJESD), Roseville City School District (RCSD) (Figure 3), and Center Unified School District (CUSD). Additionally, a number of private schools and daycare facilities are located in the vicinity but are not further discussed in this document.

Roseville Joint Union High School District has six high schools, including Woodcreek High School, which is adjacent to the Study Area, and West Park High School, located approximately 1.45 miles to the northwest, which is currently under construction. Fiddyment Road is the attendance dividing line between these two high schools; students living east of this road attend Woodcreek High School while students living west of the road will attend West Park High School starting in the 2020-2021 school year. West Park will also serve students living in the north portion of the Sierra Vista Specific Plan Area (City of Roseville 2010). Adjacent to Woodcreek High School is Challenge High School, which provides a therapeutic intervention program to students that would not thrive in a traditional classroom setting and serves the entire District (RJUHSD 2020a, 2020b, 2020c, and 2020d).



The Study Area and the majority of the surrounding area is located in Dry Creek Joint Elementary School District for middle and elementary schools. Most residents south of Pleasant Grove Boulevard, with the exception of the high-density housing immediately north of the Study Area, attend Coyote Ridge Elementary School, which is located approximately 0.24 mile south of the Study Area. Residents north of Pleasant Grove Boulevard and east of Woodcreek Oaks Boulevard attend Quail Glen Elementary School, which is located approximately 0.44 mile northeast of the Study Area. Both elementary schools serve students from transitional kindergarten through 5th grade. Students from both of these elementary schools attend Silverado Middle School for 6th to 8th grade, which is located approximately 0.42 mile southeast of the Study Area (DCJESD 2020a, 2020b, 2020c, 2020d).

Roseville City School District provides middle and elementary schools for people located northwest of the intersection of Fiddyment Road and Pleasant Grove Boulevard. Residents in this area attend Junction Elementary School, located 0.75 mile northwest of Study Area, for transitional kindergarten through 5th grade. Students then transition to Chilton Middle School, located approximately 0.97 mile northwest of the Study Area, for 6th through 8th grades (MySchoolLocation 2020; RCSD 2020a, 2020b). An additional elementary school will be constructed in the northern area of the Sierra Vista Specific Plan Area (City of Roseville 2010). Center Unified School District will provide two elementary schools and one middle school for residents in the majority of the SVSP area. The closest elementary school will be located ~1/3 of a mile west of the Study Area and adjacent to a planned open space and trail corridor that connects to the Study Area. The middle school will be located ~1.0 mile west of the site along the

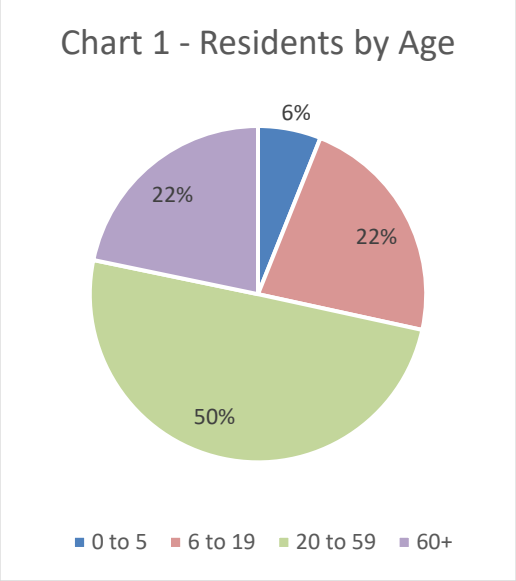
same open space corridor. Students in this area will currently attend Center High School, located ~3.4 miles southwest of the Study Area. In the future, these students are expected to be served by a future high school located to the west in unincorporated Placer County.

The Study Area may provide an important route to school for some students. As previously discussed, and shown in Figure 3, the service area for Silverado Middle School surrounds the Study Area on three sides and Woodcreek High School and Challenge High School are located adjacent to the Study Area. Therefore, it is likely that students from these schools use the Study Area to travel to and from school. Additionally, Woodcreek High School uses a portion of the Study Area as an educational tool, providing hands-on learning opportunities for High School students and providing tours for elementary school students teaching about nature, vernal pools, and the preserve (RJUHSD 2020c). The Study Area is also used by school sports teams for fitness training and fundraising (see Appendix A).

Due to the service areas and school locations, students from West Park High School, Chilton Middle School, Junction Elementary, Coyote Ridge Elementary, Quail Glen Elementary, and most of the schools in the SCSP area traveling between home to school will not pass through the Study Area and it is unlikely to be used for school activities. However, these students may use the Study Area as a destination or to access extracurricular activities. The Study Area is located within walking distance of Coyote Ridge Elementary and the future elementary school in the SVSP area and could be used for educational activities.

Source: Aerial (SanGIS, 2014); Zoning (SanGIS 10/2016)

HELIX Environmental Planning



School Attendance Area Boundaries

Figure 3

2.5 DEMOGRAPHICS

The Study Area is located in Census Tract 06|061|0210. 35. To capture the Study Area and the neighborhoods immediately around it, this demographics analysis was performed on tracts 0210. 35, as well as tracts 0210. 37, 0210. 38, 0210. 40, 0210. 43, 0210. 44, and 0213.22 (Figure 4). The analysis is based on 2018 5-year projections (USCB 2018).

Within these seven tracts are an estimated 47,615 residents, 47% of whom are male and 52% of whom are female in 16,579 households. Approximately 75% (12,470) of the households are families with an average of 3.65 persons/household. The remaining quarter are single-person households, or unrelated roommates. Residents are relatively proportionately divided between adults (age 20 to 59), seniors (60 and over), youth (19 and under) (Chart 1). In this respect the seven tracts surrounding Study Area have a similar age makeup as the City as a whole. Within the vicinity of the Study Area, almost all (95%) of 5 to 19-year-olds are enrolled in school, including preschool through college. Of those enrolled, 96% (~9,700) are attending public schools (USCB 2018). As discussed in this report, because the Study Area is located between residential areas and their assigned schools, it has the potential to be an important route to school. The large senior population in the area also indicates that the Study Area offers an opportunity for daytime use by retired persons.

Residents primarily speak English at home. While 18% of residents speak a different language at home and 5% of residents do not speak English very well. Amongst households who do not speak English well, 21% speak Spanish, 28% speak an Indo-European language, and 50% speak an Asian-Pacific Islander language (USCB 2018). The majority of residents speak English well meaning there is an opportunity to communicate to Study Area users via using English-language only signage and programs. If signage in additional languages was an interest of the community, Asian-Pacific Islander language signs present the opportunity to reach the most residents.

California's median household income in 2018 was $71,228 and median household income in the City of Roseville is $84,105. Five of the seven census tracts surrounding the Study Area (0210.35, 0210.38, 0210.43, 0210.44, and 0213.22) have a median household income higher than either the state or City, ranging from $98,167 to $120,990. The median household income for tract 0210.37 is $60,927 and for

tract 0210.40 is $45,865. Since tract 0210.40's median household income is less than 80% of the state's median household income, this community is considered low-income. This tract includes residents in an age-restricted senior community, many of whom are on fixed incomes. Within these seven tracts, 4,105 residents (~9%) are reported to be below poverty level, with 925 of these residents under the age of 18. Poverty level compares family size and composition against income thresholds to determine who falls below the threshold. These thresholds are defined by the Census Bureau, with the poverty threshold for a family of four being $25,701 in 2018 (USCB 2019). Ensuring that residents below the poverty level and low-income communities have access to and benefit from any improvements within the Study Area is important for the health and wellbeing of these more vulnerable community members.

Residents 16 and older generally have access to vehicles with 82% having access to 2 or more vehicles, 16% having access to one vehicle, and 2% having access to no vehicles (USCB 2018). With this ready access to cars, it is more likely that the site will be used by youth commuting to school or for recreational purposes than as a way for residents to get to work.

Of housed residents within these six tracts, 95% have a computer and broadband internet connection at home, 3% have a computer, but no internet subscription, and 2% have no computer. Within tracts 0201.37 and 0201.40, respectively, only 83% and 84% of housed residents have access to both a computer and broadband internet connection. While the majority of local residents can access information about recreation opportunities or limitations online, additional analog outreach and communication efforts may be needed to reach all community members in the two tracts with lower internet access.

3.0 OPPORTUNITIES AND CONSTRAINTS

The existing natural resources, built elements, and extensive informal use of the Study Area present both design opportunities and constraints.

3.1 BIOLOGICAL RESOURCES

The Study Area includes a variety of habitats that are home for many species of wildlife and plants. The majority of the Study Area is annual grassland habitat. Natural and constructed vernal pools and seasonal wetlands occur within the annual grassland habitat. Oak woodland habitat occurs in the eastern to central portion of the Study Area and riparian woodland habitat occurs along Kaseberg Creek in the northeast portion of the Study Area. Smaller seasonal drainages cross the center of the Study Area, flowing from south to the north before joining Kaseberg Creek. The Study Area contains 259 native oak trees protected under the City of Roseville Tree Ordinance and an additional 502 non-protected trees. Special-status species are those that are legally protected under state, Federal, or local codes or that receive consideration during California Environmental Quality Act (CEQA) review. The habitats in the Study Area provide potential habitat for 24 special-status wildlife species and 9 special-status plant species, as well as many more common species. Detailed descriptions of these habitats and species are included under separate cover (HELIX 2020).

Many of the biological resources found in the Study Area are legally protected under Federal, State, or local regulations. As discussed previously in Section 2, the open space was established primarily to protect these resources, specifically the vernal pools, creeks, drainages, other wetlands, riparian habitat, and protected oak trees (Figure 5). Vernal pools are wetlands that hold water in the winter and spring. They are a unique habitat and home to many endemic species that are found only in California's Central Valley, including a number of species on the Federal and State endangered species lists. Creeks, drainages, and other wetlands are protected by both Federal and State laws regulating water quality. Riparian habitat is protected by the State of California under the Fish and Game Code. Although oak woodlands as a whole do not merit special legal protections in the City, individual oak trees with a trunk diameter of 6-inches or greater are protected by the City of Roseville Tree Ordinance. Additionally, special-status species are protected regardless of the habitat in which they are found. Before disturbing any of these protected resources, a permit and coordination with the appropriate agency may be required. Failure to obtain approvals prior to disturbance can result in fines or even jail time, depending on the severity of the impact.

The legal requirements to protect these features constrain where trails and associated amenities can be located and limit where users should be allowed access. These habitats also present an opportunity for education and passive recreation which can be fostered through interpretive signage and placement of benches and rest points to encourage observation. The trees also provide shade in an otherwise exposed area, which, based on the many user-created trails along and through the shaded areas, is desirable to users. Design recommendations to protect the sensitive biological resources are summarized in Table 1 below (HELIX 2020).

Table 1
SUMMARY OF BIOLOGICAL RESOURCE AVOIDANCE RECOMMENDATIONS

Sensitive Resource	Avoidance Measures During Design	Regulating Agency*
Habitat		
Vernal Pool Habitat	Avoid direct impacts and minimize impacts to watershed.	USACE, RWQCB
Riparian Woodland Habitat	Avoid or minimize direct impacts to habitat.	CDFW
Protected Trees	Avoid or minimize development within the tree protection zone.	City of Roseville
Jurisdictional Waters	Avoid or minimize impacts to jurisdictional waters.	USACE, RWQCB
Special Status Species		
Special-Status Plants	Avoid or minimize direct impacts to vernal pools and Kaseberg Creek.	CDFW
Burrowing Owl	Minimize impacts to annual grassland habitat.	CDFW
Swainson's Hawk	Avoid or minimize removal of mature trees from oak woodland and riparian woodland. Minimize impacts to annual grassland habitat.	CDFW
Raptor Nests and Other Nesting Birds	Avoid or minimize impacts within 50 feet of known active nests.	CDFW
Pallid Bat	Preserve dead trees or trees with hollows to the greatest extent feasible.	CDFW
Western Pond Turtle	Avoid or minimize impacts to Kaseberg Creek and within 500 feet of Kaseberg Creek.	CDFW
Western Spadefoot Toad	Avoid direct impacts to and minimize impacts within 800 feet of vernal pools and seasonal wetlands.	CDFW
Vernal Pool Invertebrate	Avoid direct impacts to vernal pools. Minimize impacts to vernal pool watersheds or construction within 250 feet of pools.	CDFW, USFWS
Valley Elderberry Longhorn Beetle	Maintain minimum 20-foot setback from riparian areas that could not be surveyed.	CDFW, USFWS
Andrenid Bee	Minimize impacts to annual grassland habitat.	CDFW

Biological Constraints

Figure 5B

3.2 TOPOGRAPHY AND FLOODPLAIN

The general topography of Study Area consists of rolling and moderately sloped areas, with elevations that range from approximately 116 to 137 feet (35 to 41 meters) above mean sea level (MSL). Variations in the terrain offer just enough rise to allow for views across much of the Study Area. The rolling topography results in multiple high points in the Study Area, some immediately adjacent to Fiddyment Road and others approximately 750' east of Fiddyment Road, shortly before the first set of transmission towers. From here, the land slopes down in terraces to the seasonal drainages or streams that flow from north to south through the center of the Study Area. The eastern half of the Study Area slopes gently down to these seasonal drainages or directly to Kaseberg Creek, which cuts across the northeast corner of the Study Area. Steep slopes, particularly along the north boundary of the site where the grade comes up to meet Pleasant Grove Boulevard, limit access. The far western complex of vernal pools flows towards Fiddyment Road. There are no culverts under Fiddyment Road, so water collects behind the existing sidewalk. Although an area of 100-year floodplain was mapped along Kaseberg Creek and one of the seasonal streams in the General Plan (City of Roseville 2016), the entire Study Area is outside of the 100-year floodplain according to the most recent Federal mapping (FEMA 2018). While this means that proposed improvements are not subject to approval by outside flood control agencies, care should still be taken to avoid designs that might negatively impact the capacity of the creeks and drainages in the Study Area.

3.3 CULTURAL RESOURCES

Archaeological surveys of the Study Area were conducted approximately 40 years ago as part of the development of the surrounding area. One historic site and several prehistoric and historic isolated artifacts were identified within the general vicinity, but none of the artifacts were recommended as potentially unique resources and important cultural resources are not known to occur in the Study Area (Maniery and Maniery 1986). However, since cultural records are constantly being updated, a new cultural records search and archaeological survey should be conducted prior to construction. Additionally, consultation with local tribes should be conducted in accordance with AB 52 or current guidelines.

3.4 USE AND TRAFFIC PATTERNS

In addition to mapping the informal paths, traffic patterns in the Study Area were observed during two formal trail use counts. During each trail use count period observations were made from two locations: at the west end of the Study Area next to Fiddyment Road and at the existing lift station at the eastern end of the Study Area (Figure 6). Trail use was observed on Tuesday, June 2 from 5:00 to 7:00 p.m. and Saturday, June 6 from 7:30 to 9:30 a.m. A total of 84 people were observed using the trails in the Study Area on Tuesday evening and 99 people were observed on Saturday morning. Overall, there was a relatively even mix of pedestrians and bicyclists observed, although 80% of the users were pedestrians on Saturday morning. A total of 15% of pedestrians were accompanied by dogs on Tuesday evening and 30% of pedestrians were accompanied by dogs on Saturday morning. The full results of the trail use counts are included in Appendix C.

An online survey was conducted between Tuesday, May 26, 2020 and Friday, June 12, 2020 to gather information on how people currently access and use the Study Area, what improvements they wish to see, and what concerns they have about creating paved trails. 1,306 people responded to the survey. The access points most frequently used currently are the existing gravel access road on the east and the

west dirt path at Fiddyment Road. Other access points used by more than 15% of respondents include Mahany Park's parking lot, Silverado Oaks Urban Reserve on the south, Pleasant Grove Boulevard underpass, and Pleasant Grove Boulevard by Bear Dog Park. The most desired access points are the existing access road on the east, the outlet at Fiddyment Road, and Bear Dog Park. Other popular access points, desired by more than 15% of respondents, include Mahany Park, the Roseville Aquatics Complex, Woodcreek High School, Silverado Oaks Urban Reserve, the greenbelt bike path at Roadrunner Court, at the end of Bottlebrush Circle, at the intersection of Sun City Boulevard and Pleasant Grove Boulevard, and at the Pleasant Grove Boulevard underpass (Figure 6). The online survey results are included in Appendix D.

A preliminary traffic study was prepared examining turning movements and collisions at major intersections surrounding the Study Area. This study categorizes Pleasant Grove Boulevard and Fiddyment Road as 4+ lane roads with raised medians, speed limits of 45 and 50 miles per hour (MPH) respectively, and vehicle average daily traffic exceeds 15,000. Woodcreek Oaks Boulevard is categorized as 4+ lanes with a raised median and a speed limit of 40 MPH and vehicle average daily traffic between 9,000 and 15,000. The study recommends if at-grade crossings across any of these roads are considered, they include high-visibility crosswalk markings, adequate nighttime lighting levels, crossing warning signs, Advance Yield Here To (Stop Here For) Pedestrians sign and yield (Stop) line, and Pedestrian Hybrid Beacon (PHB) or pedestrian signals. A pedestrian over crossing or tunnel may be an appropriate solution depending on the future connections and development of the trail network. Three collisions involving a pedestrian or bicycle were identified between 2015 and 2019, one near the Fiddyment Road – Westhills Drive intersection, and two near the Pleasant Grove Boulevard – Woodcreek Oaks Boulevard intersection. Since the accident at Fiddyment Road – Westhills Drive, the intersection has been signalized. Vehicle collisions from 2015 to 2019 are more broadly analyzed, showing the most frequently reported factor in collisions was unsafe speed on study roadways and the most frequently reported collision types were rear-end and broadside collisions (Fehr and Peers 2020).

Based on the results of these studies, most people are traversing the site from Fiddyment Road in the east to Mahany Park in the west and from the end of the existing paved multi-use trail in the south to the Pleasant Grove Boulevard undercrossing (Figure 6). There is high demand for access from Mahany Park, indicating that the Study Area may be providing a City or regional amenity with many users driving to the site from elsewhere to use the existing paths, rather than accessing it strictly from local neighborhoods. Also of note, is the strong preference in the online survey for access near Bear Dog Park, which is reflected in the significant number of dogs observed during the trail use counts.

HELIX Environmental Planning

Access Points

Figure 6

3.5 POINTS OF INTEREST

Points of interest, locations within the Study Area with good views or that provide unique educational opportunities, are shown on Figure 7. The viewshed within the Study Area is broad, with relatively flat topography allowing views in most directions until built structures such as fences, walls, and houses or other buildings obstruct the sightline. Present within almost any view in the open space are the electrical towers, poles, and power lines that run the length of the site. In addition to their visual presence the high-voltage transmission lines (owned by SMUD and WAPA) emit a low humming/buzzing sound which is audible when walking the Open Space. The views onsite also include broad expanses of vernal pools surrounded by annual grassland to the west and woodland through the center and to the north. To the east more grassland and vernal pools are visible as well at Mahany Park and the perimeter of Woodcreek High School. The clear views of the vernal pools and woodlands create educational opportunities.

The Study Area provides opportunities for both passive and active education about a myriad of topics. The presence of many natural resources can inspire education about the species and habitats found in the Study Area or the importance of environmental stewardship. The many utility features in the Study Area and proximity to the Utility Exploration Center create an opportunity to incorporate utility-related interpretive signage along the propose Bike Trail to encourage users to think about how their actions at home influence their City. Passive education may take the form of interpretive signs, digital or paper nature trails, or similar activities that can be used at will by visitors to the Study Area. Some active education is already underway in the form of tours for local elementary schools by the Woodcreek High Nature Area class (Appendix A). Additional tours for the general public or clean-up days are examples of active education activities.

3.6 CONSTRUCTED FEATURES

There are many constructed improvements in the Study Area, both formal and informal. Formal improvements include a paved multi-use trail connecting to Silverado Oaks Urban Preserve to the south; gravel maintenance access road connecting the sewer lift station to Mahany Park to the east; perimeter post and cable fence, gates, retaining walls, and soundwalls; utilities; and preserve signs. Informal improvements consist of user-created paths, bike jumps, fairy gardens, and makeshift bridges, typically of plywood, scrap lumber, or branches. Historically, the City has removed informal bridges due to safety concerns and because they were not approved by regulatory agencies through the proper permit processes. Interventions show areas where users have intervened in the landscape for example by repairing an informal path or digging a hole. Conflicts highlight locations where user needs are in direct conflict with the site, for example where informal paths cross fences or creeks. Constructed features are shown on Figure 6 and photographs of representative features are shown in Appendix B.

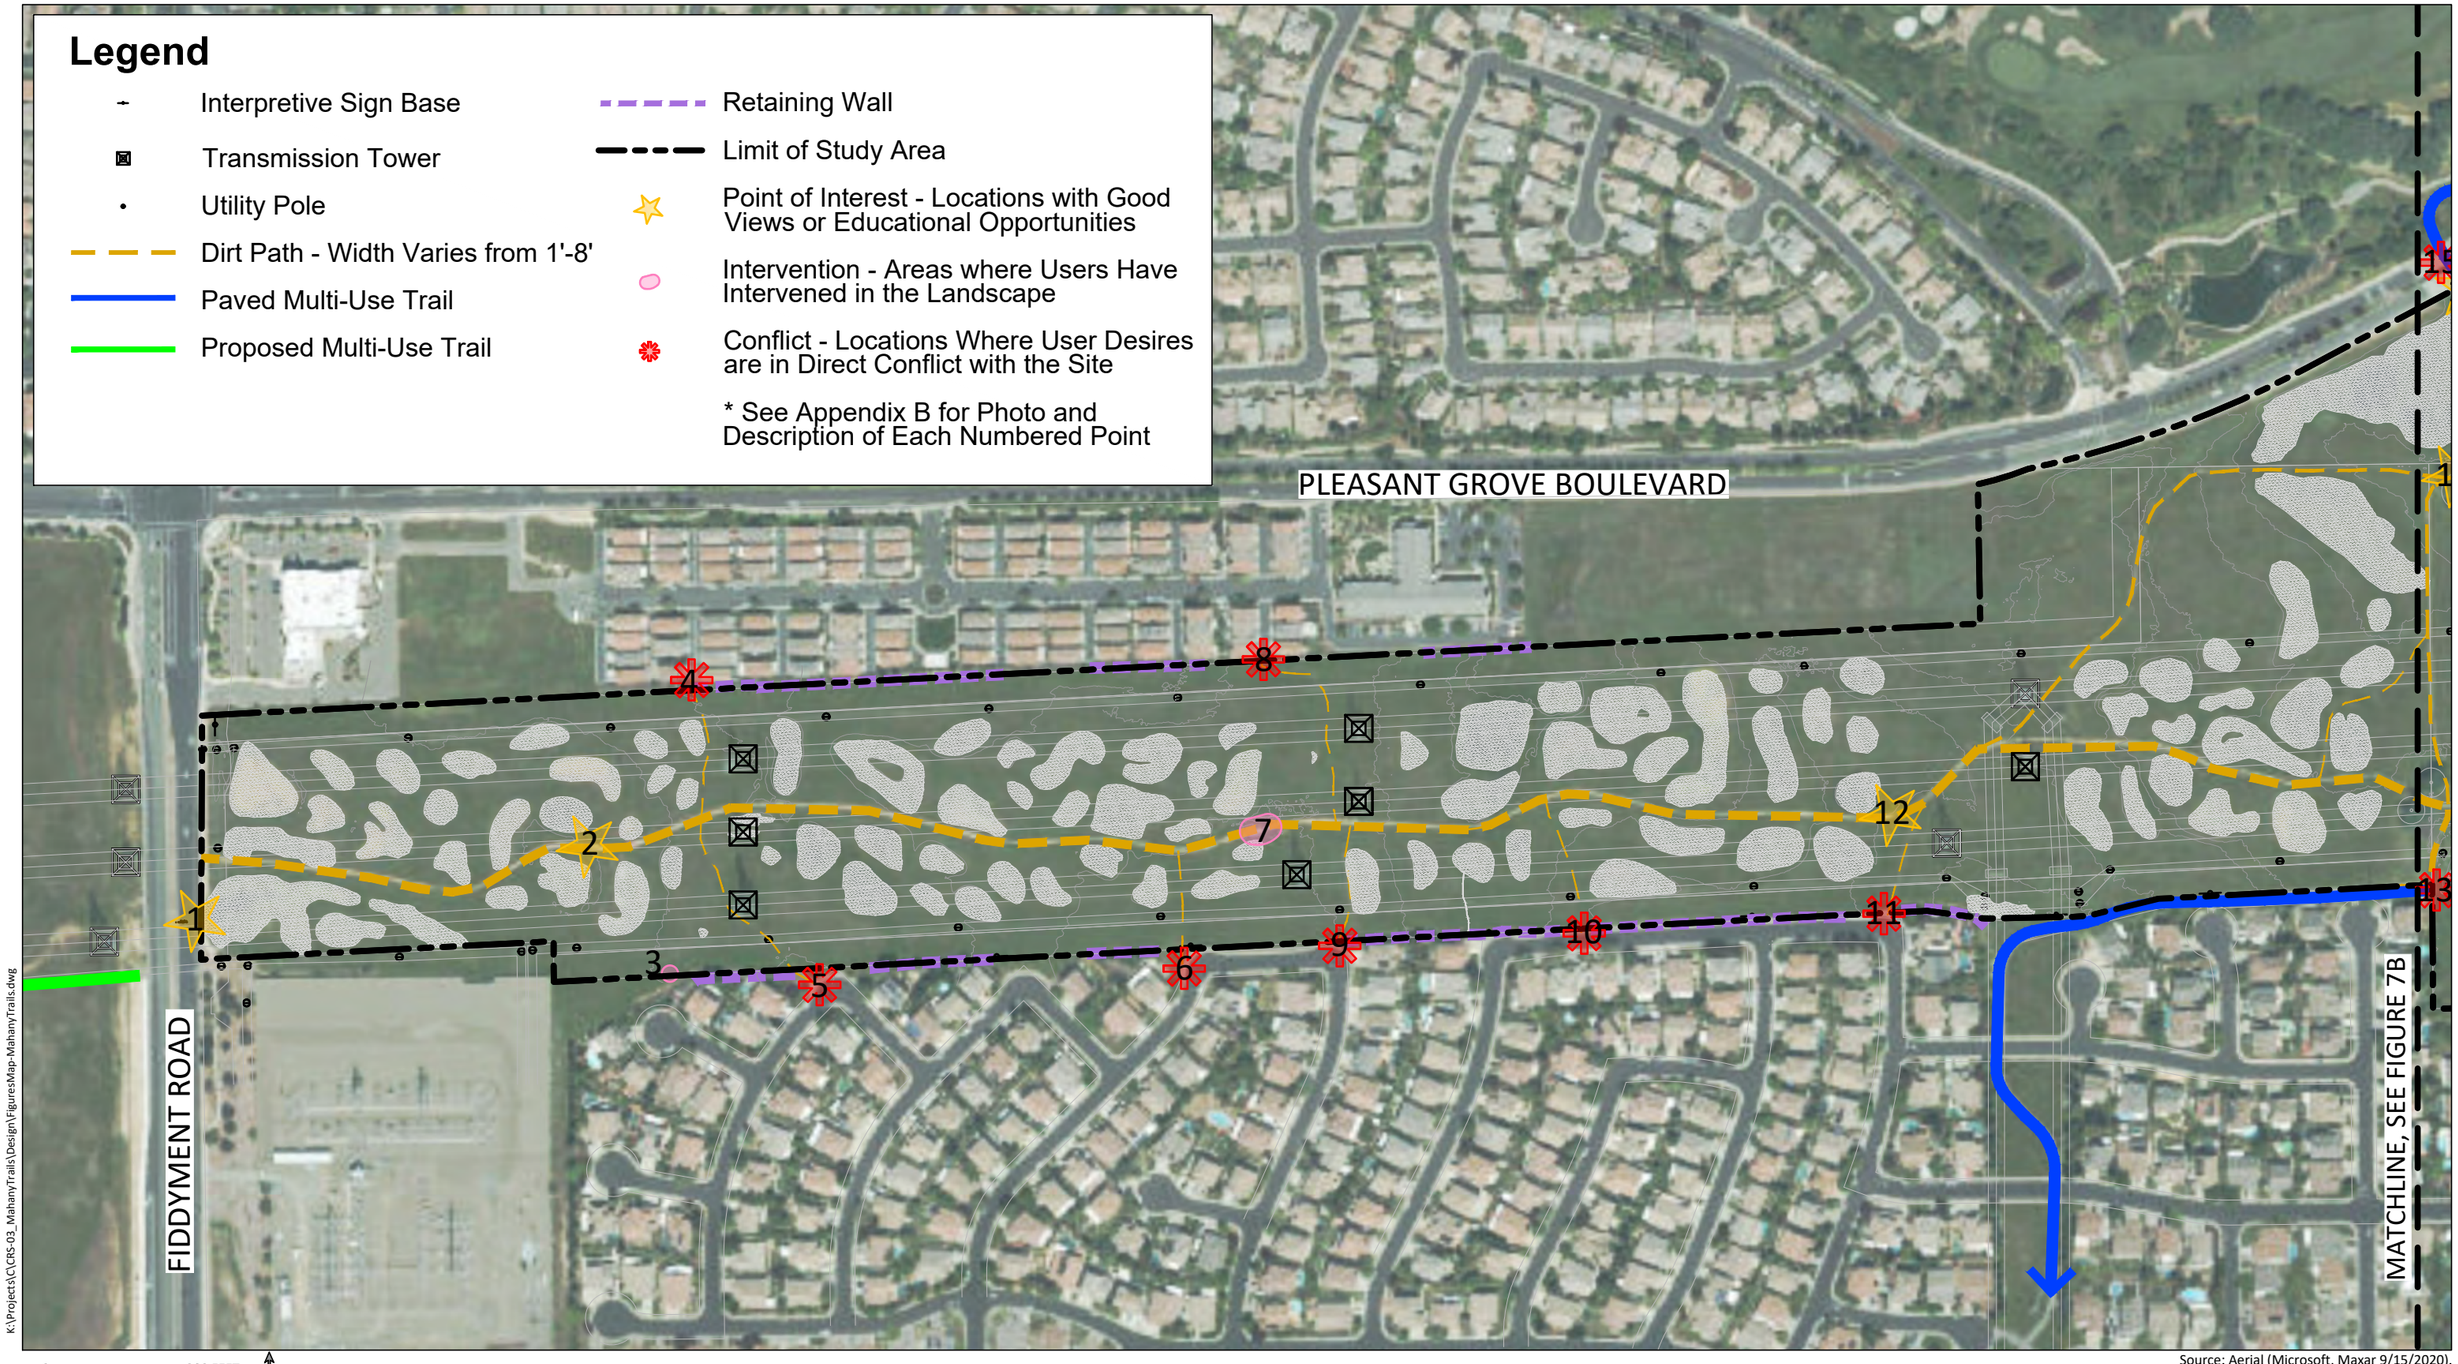
3.6.1 Informal Paths

The Study Area has many informal paths crossing the site (Figure 7). These paths range from 1-foot wide tracks where the foliage is flattened or sparse to well-defined bare dirt paths up to 8-feet wide. One of the two largest paths run east to west across the site beginning on the west side at Fiddyment and merging into the gravel maintenance access road on the east side. The other large path runs northwest to southeast from the Pleasant Grove Boulevard underpass to the existing bike path just north of the bridge. Smaller paths cut in from the cul-de-sacs of the surrounding neighborhoods, connecting to the main east-west path. There are also smaller paths connecting Mahany Park and Bear Dog Park and a few

other meandering paths, primarily in the north-central portion of the site. These paths cross the creeks in multiple locations. At these locations there are signs that users have been frequently crossing the creek including muddy bicycle tracks and footprints, debris such as plywood, sticks, and rocks to create stepping stones or temporary bridges, and signs of informal bridges which have been removed. These paths are both directly and indirectly impacting the sensitive biological resources, although they are generally routed away from vernal pools and the creek. While these paths are useful to the design process because they clearly show how users wish to access the site, they are in conflict with the City's goals and environmental regulations to protect natural resources.

3.6.2 Connections to Existing Trails

There are four existing paved multi-use trails that enter the Study Area and connect it to the larger City-wide trail system. Just east of the Roadrunner Court cul-de-sac, a paved multi-use trail ends at the southern boundary of the Study Area. Paved multi-use trails in Mahany Park on east boundary of the Study Area end in a gravel maintenance access road leading to the existing sewer lift station. The third multi-use trail extends from Silverado Oaks Urban Preserve in the south, runs north past the sewer lift station, and ends south of Kaseberg Creek. An undercrossing on the northern boundary where Kaseberg Creek flows under Pleasant Grove Boulevard connects the existing bike trails to the north with the Study Area. All of these terminated trails continue with user-created paths, indicating a desire to have them connect to each other, the larger site, and other destinations. Connecting to these existing trails provides an opportunity for greater connectivity.



3.6.3 Utilities

Extensive overhead and underground utilities run through the Study Area (Figure 8). The City of Roseville Electric Utility Department (Roseville Electric) has two sets of power lines on wood poles within easements within Mahany Open Space. Sacramento Municipal Utility District (SMUD) has one set of high voltage transmission lines on transmission towers within an easement within Mahany Open Space. Western Area Power Administration (WAPA) has two sets of high-voltage transmission lines, each on their own set of transmission towers within an easement within Mahany Open Space. A sewer trunk line crosses the eastern half of the site from north to south. A sewer lift station is associated with a sewer force main which extends east from the sewer lift station under the gravel maintenance access road.

Utilities and Easements

Figure 8

4.0 TRAIL DESIGN GUIDELINES

A number of documents provide guidelines for trail design and development in the City of Roseville. Additionally, the Study Area includes Open Space Preserves established to protect sensitive natural resources and which are therefore subject to additional restrictions, as well as extensive utility infrastructure. Applicable design guidelines are discussed in the sections below and summarized in Table 2.

4.1 OPEN SPACE PRESERVE OVERARCHING MANAGEMENT PLAN

As discussed in Section 2, the OSPOMP provides guidelines for restoration of various habitats. These guidelines should be integrated into the final project to restore areas impacted by informal dirt trails, user interventions, and other disturbances to the open space preserve. Applicable restoration measures in the OSOMP include:

- The restoration of grassy upland areas includes seeding, temporary erosion control measures, and invasive plant removal. These guidelines apply to damaged areas of grassland habitat.

- The restoration of accidental fill of wetlands of the U.S. includes notifying the USACE and USFWS, removal of fill, minor regrading, and revegetation. These guidelines may apply where dirt paths cross or veer into wetlands.

- The restoration of fencing and signage includes fixing, upgrading, or replacing the section of fencing or the sign which was damaged to its original specifications. These guidelines apply to damaged or graffitied signs or fences.

- The restoration of erosion can include minor grading and reseeding with native seeds to stabilize exposed soil, use of straw wattles, or the installation of turf reinforcement mat/erosion control blanketing, or other erosion control methods approved by the city engineer in consultation with the open space manager. These guidelines apply to areas eroded by repeated pedestrian or bicycle use.

- The restoration of undesignated trails includes adding signage, repairing fencing, ripping soil and spreading native seed mix, and distributing flyers to residents near the Open Space. These guidelines apply to the dirt paths throughout the Study Area.

- The restoration of un-permitted bike jumps/trails includes dismantling jumps in upland areas using shovel or small equipment. No loose soil is to be put in the wetlands unless the soil was removed from the wetlands resulting in a hole. If the construction of bike jumps impacted the wetlands, the Open Space manager will notify the USACE and USFWS. These guidelines apply wherever there are un-permitted bike jumps.

- The restoration of landscaping or gardens includes notifying the party responsible, requesting corrective action, and then requiring payment if the City has to correct the problem. This protocol would apply to the fairy garden established near the sewer lift station.

Additional design requirements in the OSPOMP include:

- Where fencing along roadway and bike trails is required by an Agency permit, fencing will be post and cable, four-foot black vinyl covered chain link, four-foot tubular steel, guard rail, or concrete rail fencing.

- Bollards are to be placed in locations where trails enter the Open Space to prevent unauthorized vehicle access. Gates are currently installed to allow access for maintenance crews, emergency vehicles, and/or monitoring staff.

- The City may install additional open space preserve signs as needed. The City may also install interpretive signs near the various native communities which education the public about native communities, their conservation, common species, and which encourage respect. Included in the appendix of the OSPOMP are guidelines for the design open space preserve and interpretive signs and sign examples.

4.2 CITY OF ROSEVILLE DESIGN AND CONSTRUCTION STANDARDS

The City of Roseville Design and Construction Standards (City Standards) are requirements for the design and construction of civil improvement projects within the City of Roseville. Section 13 – Bikeways provide standards to ensure that transportation and recreational bikeways are constructed in a manner that provide a safe and comfortable use by both bicycles and pedestrians. These standards are illustrated in standard details BK-1 through BK-5. Bikeways must be designed to meet the following requirements:

- The minimum paved width for a two-way bike path shall be 10 feet and have a minimum of 2-foot wide graded shoulders adjacent to the pavement.

- If the bike path is located adjacent to a creek, ditch, or downslope greater than 3:1, a minimum shoulder width of 5 feet from edge of pavement to top of slope is required.

- One shoulder shall consist of Class 2 Aggregate Base and the other shall consist of decomposed granite. Where profile grades are 4% or more, the decomposed granite may be stabilized with lime/fly ash or cement treatment or be replaced with Class 2 Aggregate Base.

- A minimum of 3 feet of horizontal clearance to obstructions, including post and cable fencing shall be provided adjacent to pavement where downgrades are less than 4% and a minimum of 5 feet from the edge of pavement where downgrades exceed 4%.

- Maximum recommended grade is 5% but can be 5-6% for up to 800 feet, 7% for up to 400 feet, or 8% for up to 200 feet and signed appropriately as required.

- The vertical clearance required is a minimum of 12 feet when Fire Department access is required, otherwise 9 feet.

- When a bike path is to be located in the City's Floodplain, the path shall be designed to be no more than one foot below the 10-year storm event water surface elevation. The minimum

elevation of the bike path constructed in a floodplain shall coincide with the 2-year water surface elevation.

- Bike bridges shall conform to requirements for pedestrian and bicycle bridges within Caltrans Bridge Design Specifications. Bridge shall have minimum width of 12 feet where Fire Department access is required, or 10 feet where it is not.

- Pavement markings shall be per Caltrans Standard Section 84-3 and California MUTCD Section 9C. 03 and signs per Section 9B. 01.

- Guide signs to roadways, and other points of interest shall be provided at trail junctions and as determined by City Engineer.

- Entry points to bike paths shall be designed to prevent unauthorized vehicle entry, which may include signage (City of Roseville 2020a).

4.3 UTILITIES

As discussed in Section 3 and shown on Figure 7, a number of utility easements cross the Study Area and the entire western half of the Study Area largely occurs within utility easements. While some design guidelines for the various utilities apply only to the areas within their easements, shared improvements, such as gates and access roads should be designed to meet the most stringent requirements.

4.3.1 Roseville Electric

Roseville Electric reviews plans as part of the City's standard process for electronic plan review (Roseville Electric 2020a). Relevant Roseville Electric design requirements include:

- No grading within 10 feet of electrical poles without notification (Roseville Electric 2020a).

- Maintenance roads must be minimum three-inch-thick asphalt over eight-inch-thick aggregate base (Roseville Electric 2020b).

4.3.2 SMUD

SMUD's Guide for Transmission Encroachment considers 'passive recreational parks', including trails, as acceptable secondary uses within transmission easements so long as they do not impact SMUD's ability to enjoy its full rights within its easements (SMUD 2013). SMUD requires an application and improvement plans be submitted to their Land Specialist within their Real Estate Services Department for internal review and approval (SMUD 2020). Relevant SMUD specific design requirements include:

- No excavation within 10 feet of any structure shall be allowed (SMUD 2008).

- Grading must maintain safe clearances (15' for wood pole or anchor, 25' for steel lattice tower and steel pole) and any fill shall be compacted to 90% maximum dry density (SMUD 2013).

- Joint use of public facilities is not allowed, and existing access road may not be impacted by installation of a trail. Access roads must be provided if current access road is impacted (SMUD 2013).

- Where a fence or wall restricts access to a SMUD right of wall, gates are required. Gates must have a minimum of 15' opening and be provisioned for a SMUD standard lock (SMUD 2013).

- Any metal structures within the right of way are to be properly grounded (SMUD 2008).

- Any vertical structure shall not exceed 15 feet in height (SMUD 2013).

- Construction activities within 25 feet of transmission towers will require the presence of a SMUD inspector onsite prior to the beginning of any work in that area (SMUD 2013).

4.3.3 WAPA

WAPA requires all improvement plans be submitted to their Reality Specialist for internal review and approval (WAPA 2020a). Relevant WAPA specific design requirements include:

- Thirty feet of unobstructed access is required around towers. If trails do not restrict maintenance equipment access, they may be allowed within 30 feet of the transmission line structure, particularly if they double as a maintenance road (WAPA 2020a).

- No ground elevation changes are allowed within 20 feet of a transmission line structure. (WAPA 2020b).

- A 14-foot wide gate is required on any fence which restricts access to their equipment. (WAPA 2020b).

4.3.4 Sewer

The City of Roseville operates and maintains the sewer system. Sewer reviews plans as part of the City's standard process for electronic plan review (City of Roseville 2020d). Although the existing sewer trunk line and lift station are not located in a separate easement, the City of Roseville Design and Construction Standards provide the following guidance for development around sewer lines:

- Easement width must be minimum of 15 feet centered on sewer line and their minimum width must be equal to the trench width plus two additional feet for every one foot of depth of pipe.

- No trees or permanent structures are allowed within easement.

- A minimum 12-inch clearance from top of pipe to any other utility or improvement.

- Load on pipe must not exceed that allowed by pipe rigidity, as determined by Marston's formula (City of Roseville 2020a).

- The sewer force main and lift station may be utilized for future wastewater and recycled water projects, so access for construction and operation and maintenance vehicles and personnel to these sites must be maintained.

- In order to accommodate future projects within the sewer lift station, a staging area of approximately 10,000 square feet adjacent to the sewer lift station will be required. Construction of a multi-use trail must not interfere with this staging area (City of Roseville 2020c).

- Where existing sewer force main runs under the gravel maintenance access road, any future paving must not damage the sewer force main.

- Any new paving along the gravel maintenance access road must be able to withstand access by a vactor truck (a large, 3 axeled, vacuum tractor truck). A standard City bike lane is an adequate width (City of Roseville 2020d).

Table 2
SUMMARY OF DESIGN GUIDELINES

Source	General Trail Design	Trail Width	Fencing and Trail Access	Gates	Setbacks	Signage and Educational Opportunities	Approval Requirements
Open Space Preserve Overarching Management Plan (OSPOMP) 2011	Paved bike trails to have adequate width, grade, visual clearance, and surface materials to provide safe passage for anticipated users of all abilities. Within Open Space Preserve, reclaim social trails and eliminate access to entry points. Within General Open Space, reclaim social trails only if the Open Space Manager determines they are negatively impacting Preserve resources.		Install fencing adjacent to trails and overlook points. Fencing will be post and cable, four-foot black vinyl covered chain link, four-foot tubular steel, guard rail, or concrete rail fencing. Bollards are placed in locations where trails enter into the Open Space to prevent unauthorized vehicle access.	Gates are currently installed to allow access for maintenance crews, emergency vehicles, and/or monitoring staff.	Avoid trails through sensitive habitats such as vernal pool grassland.	Install additional open space preserve signs as needed. The City may also install interpretive signs near the various native communities which education the public about native communities, their conservation, common species, and which encourage respect. Discourage Vandalism and other unwanted activities by taking a comprehensive approach to enforcement that includes signage, patrols, and a telephone hotline for reporting violations. Install consistent Open Space signage that is constructed out of materials that are not easy to damage. Educate residents regarding City leash laws. Encourage safe and appropriate use of the City's Open Space by schools conducting environmental education. (Sample open space and interpretative signage provided in OSPOMP.)	Existing trails were either permitted and installed as part of the development requiring an Open Space Preserve or were permitted separately as their own project within the General Open Space. When plans are developed, the Project Proponent will coordinate with the appropriate State and Federal Agencies from approval of all required permits including Section 7 or 10 consultation with the USFWS.
City of Roseville Bicycle Master Plan 2008	Estimated 0.77 miles of trail in Project Area at cost of $1.3 million a mile.					Recommend installation of bike parking, mile markers and destination guide signs, and trail maps at trailheads.	
City of Roseville Design/Construction Standards	Trail shall be minimum 2" asphalt over 4" aggregate base. Base must be greater if vehicular or emergency access is required. One shoulder shall be decomposed granite paving and the other should be Class 2 aggregate base. Sections over 4% can have Class 2 aggregate base on both sides or decomposed granite paving may be stabilized with lime/fly ash or cement treatment. Design speed for 20 mph. If downgrade exceeds 4%, minimum design speed shall be 30 mph. Maximum grade recommended is 5% and 2% cross slope.	Minimum width to be 10' for two-way trail and 5' for one-way. Trail shall have a 2' shoulder on both sides of pavement. Clear width on structures between railings shall not be less than 12'. When fire access is required, 12' clear width required.	Post and cable fencing to be a minimum 3' clearance from adjacent pavement. Design trail access to prevent unauthorized vehicular entry.	Access points with a width of 20' shall be placed at intervals of 750' and cable must be coated with yellow to designate access and padlock provided on both ends	Minimum 3' clearance to permanent obstructions where downgrades are less than 4%, 5' when over 4%. If trail is adjacent to a continuous fixed object, a 4" white edge line, 2' away from the fixed object is required. 5' minimum from top of slope if adjacent to creek, ditch, or downslope greater than 3:1.	See California Manual on Uniform Traffic Control Devices Section 9B.01. Shared-use paths shall conform to 9B-1 for Class I trails. Trail junctions shall have guide signs and as determined by City Engineer. Entrances shall have entry signs with regulatory sign prohibiting motor vehicle entry. Trail segments greater than 5% slope shall be posted with appropriate warning sign.	Bike bridges to support gross pounds but shall include maintenance vehicle traffic loading with approval of Fire Department and City Engineer. vehicular weight of less than 30,000 Letter of Map Revision may need to be submitted to FEMA for approval as determined by public works for bridges in floodplains. Bikeway improvement plans must be accepted by Development Services Engineering Division and meet requirements of Section 3 "Plan Sheet Requirements".

Table 2 (cont.**)**
SUMMARY OF DESIGN GUIDELINES

Source	General Trail Design	Trail Width	Fencing and Trail Access	Gates	Setbacks	Signage and Educational Opportunities	Approval Requirements
City of Roseville Design/Construction Standards (cont.)	Bikeway design must conform to "Guide for Development of Bicycle Facilities", Caltrans "Bikeway Planning and Design", CA Manual on Uniform Traffic Control Devices for Streets and Highways", and any relevant Specific Plan. Stopping site distances per Section 7-12 and figure 1003.1D of Caltrans Highway Design Manual. Lateral clearance and horizontal curves shall conform to 1003.1F from Caltrans.						
SMUD	SMUD's Guide for Transmission Encroachment considers features they term 'passive recreational parks' which includes trails, as acceptable secondary uses within transmission easements so as not to impact SMUD's ability to enjoy its full rights within its easements. Joint use of public facilities is not allowed, and existing access roads may not be impacted by installation of a trail. Access roads must be provided if current access road is impacted.		Metal structures within ROW must be properly grounded. Vertical structures cannot be more than 15' high.	15' gates are required where wall or fence restricts access.	No grading within 15' of wood poles and 25' from steel structures. Construction activities within 25' of structures require presence of SMUD inspector onsite prior to work beginning. No excavation within 10' of any structure.		Plans must be submitted to their land specialist within Real Estate Services department for approval.
WAPA	No maintenance road guidance provided.			14' gate needed on any proposed fence that restricts access to equipment	30' unobstructed access around towers. Trails can be within 30' buffer if they do not restrict maintenance equipment access or double as maintenance road. No ground elevation changes allowed within 20' of structures.		Need improvement plans submitted to their Reality Specialist for approval.
Roseville Electric	Maintenance roads must be minimum three-inch-thick asphalt over eight-inch-thick aggregate base.				No grading within 10' of electrical poles without notification.		Roseville Electric reviews plans as part of the City's standard process for electronic plan review.

Table 2 (cont.**)**
SUMMARY OF DESIGN GUIDELINES

Source	General Trail Design	Trail Width	Fencing and Trail Access	Gates	Setbacks	Signage and Educational Opportunities	Approval Requirements
Roseville Sewer	Where sewer line is present, the sewer easement width is a minimum 15' centered on sewer line and their minimum width must be equal to the trench width plus two additional feet for every one foot of depth of pipe. The sewer force main and lift station may be utilized for future wastewater and recycled water projects, so access for construction and operation and maintenance vehicles and personnel to these sites must be maintained. In order to accommodate future projects within the sewer lift station, a staging area of approximately 10,000 square feet adjacent to the sewer lift station will be required. Construction of a multi-use trail must not interfere with this staging area.		Any new paving along the gravel maintenance access road must be able to withstand access by a vactor truck (a large, 3 axle, vacuum tractor truck). A standard City bike lane is an adequate width		Where existing sewer force main runs under the gravel maintenance access road, any future paving must not damage the sewer force main. Within a sewer easement: -No trees or permanent structures are allowed. - A minimum of 12" clearance required from top of pipe to any other utility or improvement. - Load on pipe must not exceed that allowed by pipe rigidity.		Sewer reviews plans as part of the City's standard process for electronic plan review.
U.S. Fish and Wildlife Service					Avoid direct impacts to vernal pools. Evaluation of Indirect impacts will be based on impact to pool microwatersheds. Development downhill/ downstream from pools will have less impact.		Section 7 or 10 consultation prior to construction. Possible Incidental Take Permit, depending on project footprint and sensitive resources.
California Department of Fish and Wildlife					Avoid direct impacts to riparian vegetation and creek channels.		Submit 1600 Permit application prior to construction. Possible Incidental Take Permit, depending on project footprint and sensitive resources.
U.S. Army Corps of Engineers					Avoid direct impacts to waters of the U.S.		No involvement unless direct impacts to jurisdictional waters of the U.S., in which case Section 404 permit is needed prior to construction.

Mahany Park and Open Space Trail Feasibility Study

Stakeholder Questions

Name: Guru Niyam K.

Contact: woodcreekoaksna@gmail.com (e-mail preferred). (707) 718-5526

Date of Interview: 5/15/2020

Interviewed by: JLL

Position: Secretary for Woodcreek Oaks Neighborhood Association.

Ensure they are familiar with the project boundary (website is Roseville.ca.us/mahanytrail)

1. How do you currently use the site?
   Personally enjoys going out and walking through the open space. A few years ago there was a makeshift bridge then it was removed. Ever since bridge removed haven't gone on west side of the open space. Before that used to run all the time. Now will take the kids out to enjoy the spring flowers and vernal pools (used the wrong word – vernen pool). Stays pretty close to the high school now. Really enjoy walking on the dirt trails and reading signs in the nature area.
2. Do you have any concerns about the site as it is currently?
   No bridge. Not exactly a concern, but don't really like walking on the gravel path. Not a lot of shade, so need to plan accordingly.
3. Would you like to use the site differently? If so, what amenities would you like to see?
   Bridge/crossing to allow use of full site.
4. If a multi-use trail was added to the site would you use it? If yes, how?
   Having a bike path has real perks, but also likes dirt trail. Kids and her bike often, but not within preserve because of the dirt. Would bike on it with family if paved. Trys to avoid streets, so would be nice to have more off-street path. There is a balance between wildness of site (which she loves) and the trail, so wants to retain natural feel. Loves how there are fallen trees, wildlife at different times of year.
5. In your opinion, what are the benefits of adding a multi-use trail to the site?
   More off-street bike trail is great. Used to go to dry creek to ride. 1.5 mile each way with playground at end was great there. A multi-use trail presents so much opportunity for younger kids/families. There is a ton of trail on other side of town with miner's ravine, would like more on this side.
6. Do you have concerns about adding a multi-use trail to the site?
   Retain natural feel. Don't want eyesore. People love walking their dogs through there. Some trash cans and signage about picking up after dogs would be great. Maybe more trees/shade. It is nice to have dirt trails to run on too. Maybe keep dirt trails?
7. Are you aware that the site is a preserve put in place to protect the vernal pools and the endangered species they contain?
   Did notice behind the high school the nature area had signs and explained about it. Knew that there were areas to preserve/protect right around nature area (which she was calling Silverado Oaks Preserve, but only actually referencing nature area). Didn't realize the rest of the site was a preserve.

Follow up questions, would you like to see more interpretative signage: Likes the informational signs. Gives kids a way to connect to the space and helps to let her answer questions/prompt discussion. Really likes the idea of having spread out interpretative signage so people don't take it for granted. That's what we get to enjoy about it.

8. Do you have anything you would like to add?
   There is a bike trail that pops out onto Woodcreek oaks. Then you can cross Woodcreek oaks then get onto trail behind the pool which would ultimately take you into Mahany preserve. One thing that could be an issue is people coming from east and want to cross Woodcreek oaks midblock (not at crossing). Trail continues directly on other side of street, this is safety concern. Educate people to go to traffic light. There is a little bridge, keep or remove to deter people? It would be so nice to have a safe midblock crossing. Add signs?
   Would love to connect to the greenbelt to the south.

Mahany Park and Open Space Trail Feasibility Study

Stakeholder Questions

Name: Kendra Grinsell

Contact: 916-624-6405

Date of Interview: 5/13/2020

Interviewed by: JLL

Position: Woodcreek High School Nature Center Coordinator and Science Teacher

Ensure they are familiar with the project boundary (website is Roseville.ca.us/mahanytrail)

1. How do you currently use the site?
   Sit down shows at the two bench areas out there (30 min) then kids hike the trails (down toward bridge then up to bike trail by sub station then through oak grove then down gravel road)
   Group size for tour normally 6-12 plus 4-6 parents that follow. Up to 20 people, typical 15. 2 side by side or single file.
2. Do you have any concerns about the site as it is currently?
   The oak grove area will get paint ballers and pellet gun kids. Dirt bike ramps and forts. Broken branches for 'bunkers' and digging. Less common now. The trail through middle of oak grove overrun with thistle. Now go down under powerlines and have to walk further. Used to turn at oak tree line (by open space sign which leads to digging) now have to go farther west to most exposed area.
3. Would you like to use the site differently? If so, what amenities would you like to see?
   Add trail through oak grove. When first started added native garden – gone now because rodents ate through drip, then drought. Repaired leak and marsh went away. Hoped for post and cabling along trail. Discussed permeant sign, but lots of vandalism of benches and signs. Kids will drink, smoke, start fires by benches. Clean every Monday. Because there are no lights, people can't see youth sitting out there. Will graffiti out there.
   Follow up question: Would you like if trails were paved? Like that its dirt because it feels natural, but kids with disabilities have trouble navigating through mud.
4. If a multi-use trail was added to the site would you use it? If yes, how?
   Would use if they paved gravel road. Will keep their general route regardless of what we do. Have access to only one vernal pool. Left most of the two if looking at signs from gravel road. Permission to dip/look into.
   Follow up question: Do you want water access? Not for nature center program. There is another nature program that isn't realize used yet, but if it takes off, freshman do nature projects and would be helpful to have water access. Kids get access to river between bridges toward Mahany.
5. In your opinion, what are the benefits of adding a multi-use trail to the site?
   More people staying on the paved trail and not wander into grass lands. Access for people with disabilities. More cyclists too.
6. Do you have concerns about adding a multi-use trail to the site?
   Worried about bringing more people to the site. Big problem is dogs off leash, chasing wildlife.

7. Are you aware that the site is a preserve put in place to protect the vernal pools and the endangered species they contain?
   Yes aware.
   Follow up: do you feel this is commonly known? No. We try to educate other people out there. Nobody knows what a vernal pools is. Treated like free open space where you can do whatever you want. Need to be monitored more.
8. Do you have anything you would like to add?
   Kendra asked if the City was looking into more educational pieces. I explained yes, looking into signage.
9. Would you be ok with us asking follow up questions? Would you like to join next weeks education conversation?
   Sure and yes.

Mahany Park and Open Space Trail Feasibility Study

Stakeholder Questions

Name: Scott Corey

Contact: (916) 257-1147

Date of Interview: 5/12/2020

Interviewed by: JLL

Position: Cycling Team (club) Coach

Ensure they are familiar with the project boundary (website is Roseville.ca.us/mahanytrail)

1. How do you currently use the site?
   Team currently uses area. Big event is ride-a-thon 1.25 mile course along trail and they complete multiple laps to raise money.
2. Do you have any concerns about the site as it is currently?
   Not necessarily. Main thing is want to have multi-use environment. Haven't seen any misuse. The ground gets soft/muddy.
3. Would you like to use the site differently? If so, what amenities would you like to see?
   Want to maintain dirt trails. Would like to be able to have training areas for team and potentially for high schools in area. Obstacles and tight turns in areas that are not heavily used. This is something that has been brought up by the league as well (short course racery). Team would be willing to maintain these trails.
4. If a multi-use trail was added to the site would you use it? If yes, how?
   A paved trail would be used by team as well, because we do some training with road bikes, but it will mostly to get from the school to Fiddyment, no actual training on site.
5. In your opinion, what are the benefits of adding a multi-use trail to the site?
   Would benefit the school a lot, adding additional running paths, more open for community. Roseville prides itself on paved multi use trails. Love that trails reinforce the community aspect.
6. Do you have concerns about adding a multi-use trail to the site?
   Don't want to lose all the dirt trails.
   Follow up question - Does gravel or DG provide same benefits as dirt?
   No gravel is really hard to ride on. Hard on tires and can throw rocks up at other ridders, slide out on turns. DG is better, but not as good as dirt.
7. Are you aware that the site is a preserve put in place to protect the vernal pools and the endangered species they contain?
   No, only aware of electrical easements. Think interpretative signage and map of boundaries and messaging to tread lightly and learn about purpose would be useful. No one on team knows this.
8. Do you have anything you would like to add?
   Glad to see work is being done. Would like to see stuff for bikers – love informal trails. Do need to watch out for creek. To help protect creek suggest a bridge. Mountain bike team is interested in helping – volunteer days (40 kids, 10-20 adults), same for cross country team. Cross country team runs there too.

Mahany Park and Open Space Trail Feasibility Study

Stakeholder Questions

Name: Gregg Bates

Contact: valleyfoothill@gmail.com; 916-773-6575

Date of Interview: 7/9/2020

Interviewed by: Meredith Branstad

Position: Dry Creek Conservancy/ Valley Foothill Watersheds Collaborative

1. How do you currently use the site?

Group does not have current projects active on site. In the past, they worked with the Roseville UEC previously for restoration and maintenance projects along Kaseberg Creek. Installed riparian planting (oaks, wild rose, monkeyflower, other riparian species) and drip irrigation lines, between Woodcreek Oaks Blvd and the existing footbridge especially on north side. Did a second project in the area behind the Mahany Park batting cages. Group installed plants and did spring and fall maintenance. The projects had some Eagle Scout involvement.

City also did restoration near Pleasant Grove Blvd crossing.

Used to do trash clean-up site relatively routinely in conjunction with City's Celebrate the Earth event. Haven't been doing it since event was cancelled. City has taken over most of maintenance of the area.

Also have done invasive species removal along the creek; Callery pears were a particular problem in the past.

2. Do you have concerns about adding a multi-use trail to the site?

The less asphalt the better to reduce runoff and water quality. Think it's a good thing to have one major asphalt path and dirt/ permeable paths for rest.

3. Do you have anything you would like to add?

Interpretive sign ideas:

- Explain the planting projects done along the creek – UEC could provide more information.
- Benefits to water quality, wildlife benefits of restoring urban steams. Holistic ecosystem of private residential landscape with urban streams.
- Don't release your pets - invasive snake in lakes downstream (Pete Balfour from ECORP studied it)/ red-eared sliders/ feral cats.
- Oak grove and wildlife (hawks, woodpeckers).
- Natural fire regime and how to manage it now in urban setting – grazing management strategy.

Opportunities to do perennial grassland restoration – but would need to protect from goat grazing.

Drainage under Woodcreek Oaks has been an erosion issue and sediment backing up creek and causing flooding. Maybe opportunities for revegetation on creek east of project site to reduce erosion.

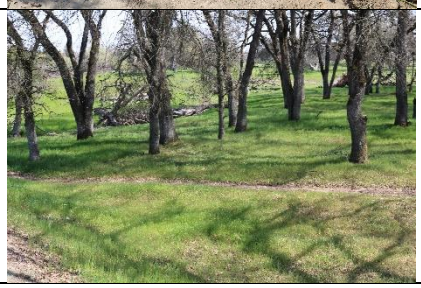
Appendix B

Opportunities and Constraints Table

This page intentionally left blank

Within the Study Area are distinct site conditions where the natural features, formal improvements, and/or informal improvements interact. These site conditions are noted in the representative site photos table, below. Three types of points are identified:



- Points of Interest – Locations where the combination of formal and informal improvements, in conjunction with the natural features, creates a notable condition.
- Interventions - Locations where users have informally intervened in the landscape.
- Conflicts - Locations where user needs are in direct conflict with the site.

This appendix supports the discussion of constructed features in section 3.6 of this report.

Point Number	Point Type	Description	Photo
1	Point of Interest	Crossing opportunity where Mahany Open Space aligns with existing maintenance road/future bike trail on the other side of Fiddyment while avoiding electrical towers.	
2	Point of Interest	This slight rise offers views looking west of well-defined vernal pools.	
3	Intervention	Large hole in ground presents possible hazard to site users and indicates homeowner use of Preserve.	
4	Conflict	Undesignated path from the adjacent neighborhood has the potential to cause disturbance to the site's sensitive resources. Path entrance requires users to go around plants.	

Point Number	Point Type	Description	Photo
5	Conflict	Undesignated path from the adjacent neighborhood has the potential to cause disturbance to the site's sensitive resources. Path entrance requires users to go over or around post and cable fence.	
6	Conflict	Undesignated path from the adjacent neighborhood has the potential to cause disturbance to the site's sensitive resources. Path entrance requires users to go in between and around shrubs.	
7	Intervention	Evidence of attempted trail widening and repair by site users.	
8	Conflict	Undesignated path from the adjacent neighborhood has the potential to cause disturbance to the site's sensitive resources. Path entrance requires users to go over or around post and cable fence.	
9	Conflict	Undesignated path from the adjacent neighborhood has the potential to cause disturbance to the site's sensitive resources. Path entrance requires users to go over or around post and cable fence.	

Point Number	Point Type	Description	Photo
10	Conflict	Undesignated path from the adjacent neighborhood has the potential to cause disturbance to the site's sensitive resources. Path entrance requires users to go over or around post and cable fence.	
11	Conflict	Undesignated path from the adjacent neighborhood has the potential to cause disturbance to the site's sensitive resources. Path entrance requires users to go over or around post and cable fence.	
12	Point of Interest	View looking west presents opportunity to view several well-defined vernal pools.	
13	Conflict	The bike path terminates with no obvious connection for bike riders.	
14	Point of Interest	Culvert under user created trail. Could allow for formalized trail crossing.	
15	Conflict	Debris has been laid down to allow users to cross over the creek.	

Point Number	Point Type	Description	Photo
16	Point of Interest	A shaded location offers a view looking north of a large, well-defined vernal pool.	
17	Point of Interest	This location offers safe north-south passage under the road and connects to existing bike path north of Preserve.	
18	Conflict	Undesignated path from Pleasant Grove Blvd. requires users to go over or around post and cable fence and up/down steep slope. Path is causing erosion.	
19	Conflict	Signs of user-built creek crossing which has been removed.	
20	Conflict	Undesignated path from Pleasant Grove Blvd. requires users to go over or around post and cable fence and through oak woodland.	

Point Number	Point Type	Description	Photo
21	Point of Interest	Smaller well-defined vernal pool very close to path presents education opportunity.	
22	Intervention	Large recently dug hole in ground with intentional seeming square shape, vertical edges, and stepped interior. Tools and trash present indicate ongoing project.	
23	Conflict	Creek and path crossing showing signs of pedestrian and bicycle users crossing through creek in this location.	
24	Conflict	Creek and path crossing showing signs of pedestrian and bicycle users crossing through creek in this location.	
25	Intervention	Large user-constructed bike jump area located within and adjacent to several vernal pools.	
26	Conflict	Debris has been laid down to facilitate creek-crossing.	

Point Number	Point Type	Description	Photo
27	Point of Interest	Ample shade and beautiful view is provided by a grove of oak trees adjacent to existing bike path. Opportunity for oak tree education.	
28	Conflict	User-constructed bike jumps boarder the existing gravel path.	
29	Conflict	Undesignated path from Bear Dog Park requires users to go up/down steep slope. Path is causing erosion.	
30	Conflict	Debris and pallets have been laid down to facilitate creek crossing.	
31	Conflict	Debris and plywood have been laid down to facilitate creek crossing.	
32	Point of Interest	The outdoor classroom is used and maintained by Woodcreek High School for their education program	

Point Number	Point Type	Description	Photo
33	Intervention	Piles of seemingly landscape materials debris indicate unauthorized disposal of material in Open Space.	
34	Point of Interest	The outdoor classroom is used and maintained by Woodcreek High School for their education program	
35	Point of Interest	Bench located along path with views of Woodcreek High Schools education area.	
36	Conflict	User-created path cuts between parking lot and gravel maintenance access road. Tire tracks indicate it is used by vehicles, but vehicles were not observed so reasons for driving into area are not known.

Mahany Park Open Space Trail Feasibility Study
Trail Use Count Data Sheet

Date: 6/2/2020

Observer's Name: Daniel Blair

Location: Intersection of existing dirt path and Fiddyment Road at west end of Study Area

Start Time: 5:00 pm

End Time: 7:00 pm

Weather: Sunny, 95 degrees

Other Notes:

People who entered the count area and then turned to travel in another direction were counted only once in the direction of travel from which they entered the Study Area. People entering from Fiddyment Road are included in the eastbound count.

People who made a round trip during the trail count period were counted traveling in both directions.

1 person was initially traveling south on Fiddyment then turned east.

3 people were initially traveling north on Fiddyment then turned east.

4 people were initially traveling west then turned south.

2 people were initially traveling west then turned north.

1 person was traveling west then turned east, roundtrip.

People observed traveling along Fiddyment but not entering the Study Area included: 1 pedestrian going north, 6 bicyclists headed north, and 2 bicyclists headed south.

Direction of Travel: East on Path

Mahany Park Open Space Trail Feasibility Study
Trail Use Count Data Sheet

Date: 6/6/2020

Observer's Name: Carolyn Hagele

Location: Intersection of existing dirt path and Fiddyment Road at west end of Study Area

Start Time: 7:30 am

End Time: 9:30 am

Weather: Overcast then sunny, 55 to 60 degrees

Other Notes:

People who entered the count area and then turned to travel in another direction were counted only once in the direction of travel from which they entered the Study Area. People entering from Fiddyment Road are included in the eastbound count.

People who made a round trip during the trail count period were counted traveling in both directions.

2 people were initially traveling south on Fiddyment then turned east.

5 people were initially traveling west then turned south.

3 people were initially traveling west then turned north.

2 people were traveling west then turned east, roundtrip.

People observed traveling along Fiddyment but not entering the Study Area included: 4 pedestrians going north, 5 going south, 2 bicyclists headed north, and 3 bicyclists headed south.

Direction of Travel: West on Path

Mahany Park Open Space Trail Feasibility Study
Trail Use Count Data Sheets

Date: 6/6/2020

Observer's Name: Daniel Blair

Location: Lift Station on eastern end of Study Area

Start Time: 7:30 am

End Time: 9:30 am

Weather: Overcast/later sunny, 55-61 degrees

Other Notes:

People who entered the count area and then turned to travel in another direction were counted only once in the direction of travel from which they entered the Study Area.

People who made a round trip during the trail count period were counted traveling in both directions.

4 people were initially traveling east then turned south

2 people were initially traveling east then turned north

8 people were initially traveling west then turned south

18 people were initially traveling west then turned north

10 people were initially traveling north then turned east.

2 people were initially traveling north then turned west.

1 person was initially traveling south then turned west.

1 person made a round trip along east-west path.

Appendix D

Survey Results

This page intentionally left blank

Introduction

The City of Roseville is studying the feasibility of developing a paved multi-use trail within Mahany Park open space which will ultimately connect with existing and proposed paved trails nearby. Part of the Mahany Park open space project area is a public park, but most of the area is considered an open space preserve. Currently, when visitors walk or bike through the area, they create dirt paths that can damage the endangered plants and wildlife within the open space preserve. The study will evaluate factors such as creeks, sensitive habitats and wildlife, topography, safety, aesthetics, and land use impacts. The open space has use limitations and trail suggestions will be considered within those constraints.

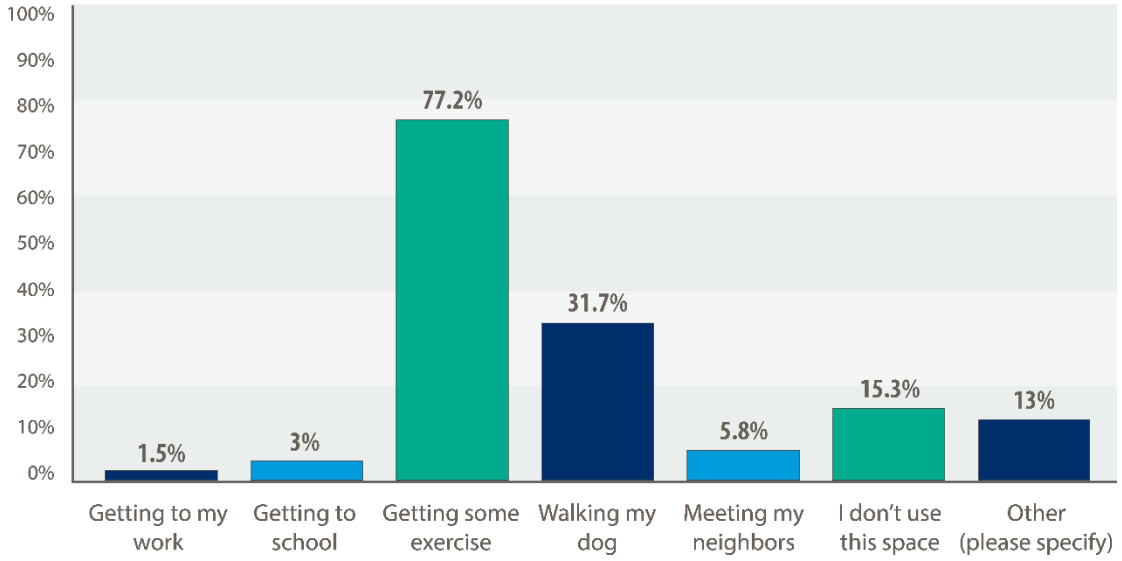
Map of the Mahany Park open space study area

The City of Roseville implemented a two and a half-week online community survey for the Mahany Park Open Space Trail Project to understand how Roseville residents and Mahany Park visitors currently use informal trails, how they access these trails, what types of future amenities they would like as a part of a paved trail, and any potential concerns with creating a paved multi-use trail. The online community survey was available from Tuesday, May 26, 2020 to Friday, June 12, 2020. The project team received more than 1,300 responses from community members. Due to the recent COVID-19 health emergency, this online survey is taking place in lieu of an in-person public workshop.

Methodology

The online informational video and community survey provided participants an opportunity to learn more about the feasibility study and provide their thoughts at the early phase of the study.

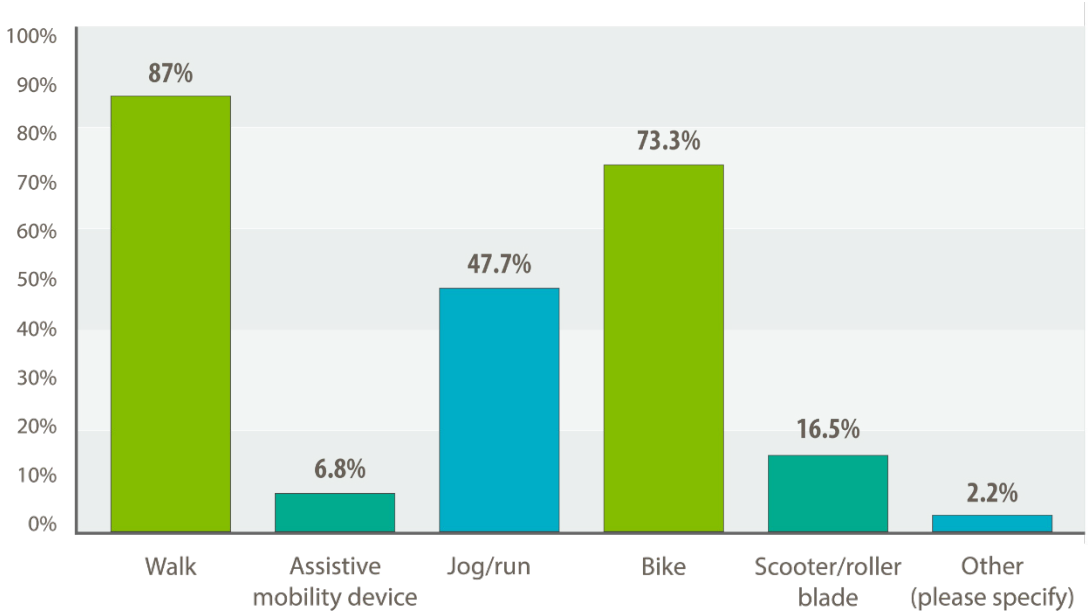
The project team received 1,306 submissions from community members. A full list of the comments submitted is available in the Appendix.



Aerial view of Mahany Park open space from the informational video

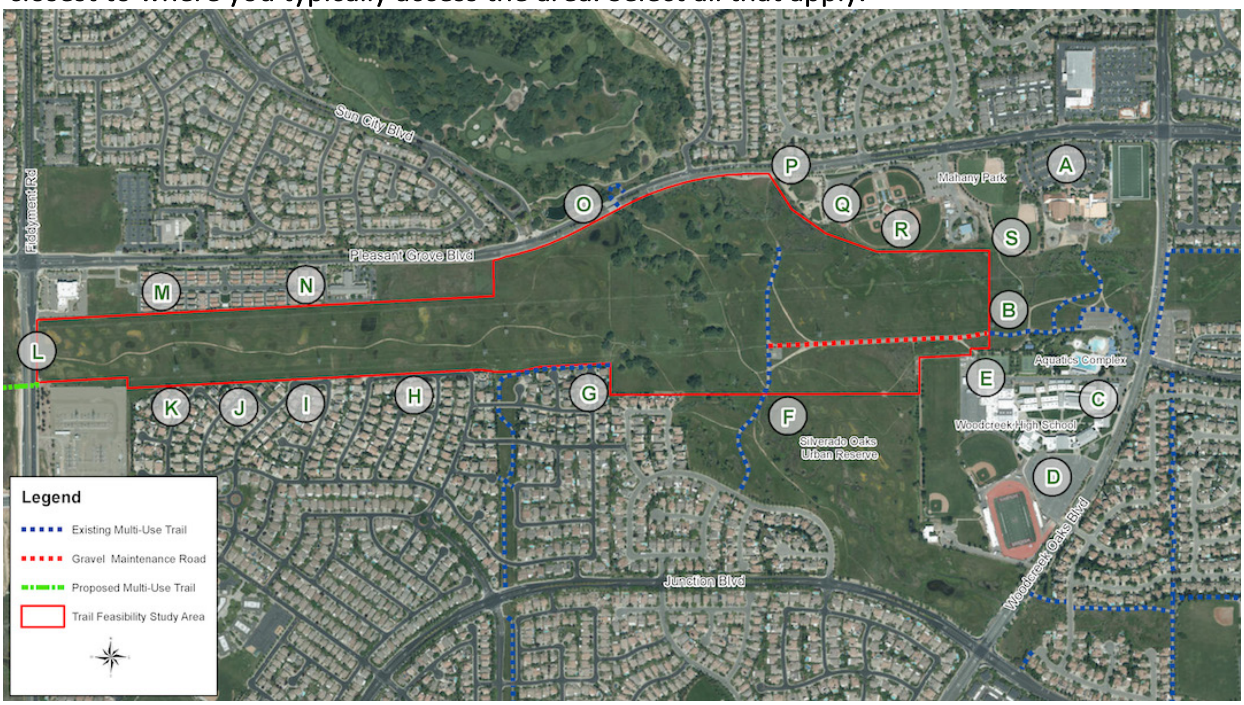
The online survey consisted of eleven (11) questions on:

- Why Mahany park visitor travel through the open space
- Mode of transportation typically used
- Existing and suggested open space access points
- Future trail amenities
- Benefits or opportunities of a paved multi-use trail at Mahany open space
- Potential concerns of a paved multi-use trail

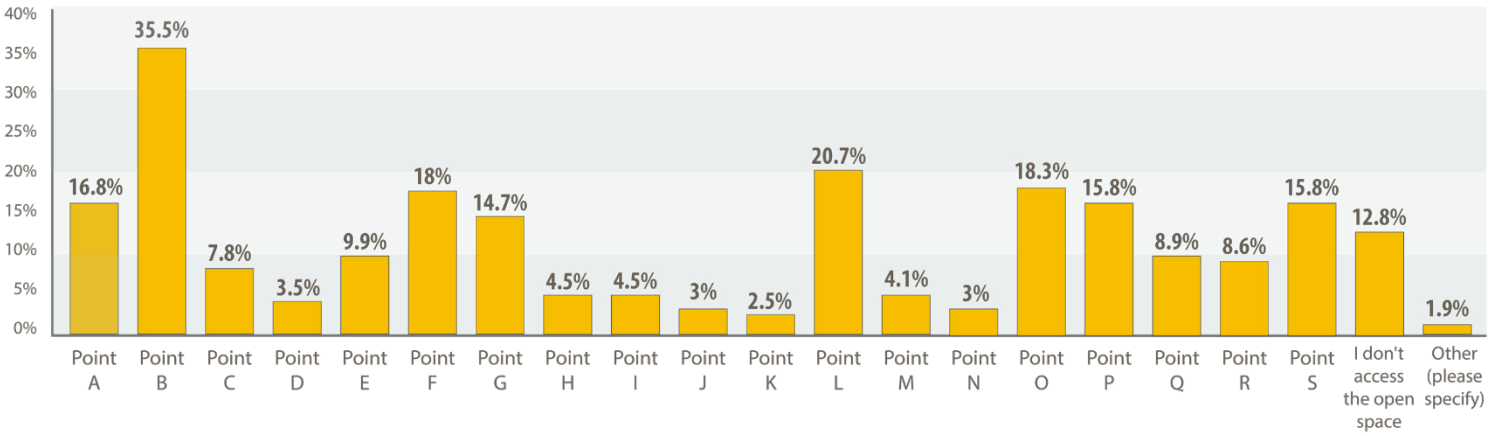


Overview of Results

1. Why do you typically travel through Mahany Park open space? (select all that apply)



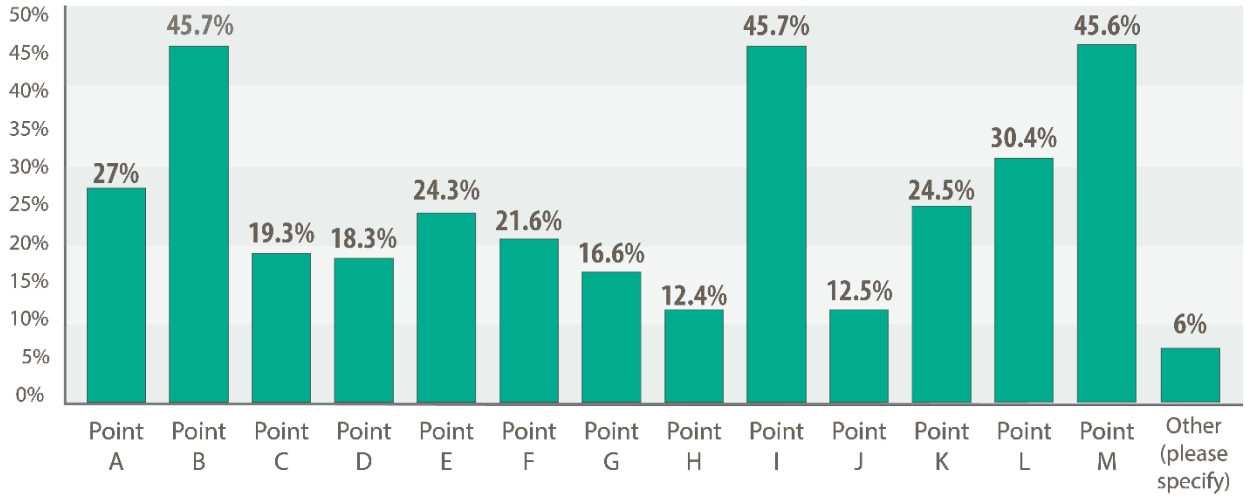
For the "Other" category, participants wrote in that they enjoying traveling through the open space to view wildlife or enjoy nature (**30.5% of "Other" responses**), go for a bike ride (**16.5% of "Other" responses**), run errands or go shopping at nearby stores (**13.5% of "Other" responses**), spend time with their friends or family (**9.4% of "Other" responses**), and getting to the library (**8.8% of "Other" responses**).



2. What mode of transportation would you want to use on future trails? (select all that apply)

For the "Other" category, participants wrote in that they would want to use their skateboard (**54% of "Other" responses**) or a baby stroller (**46% of "Other" responses**).

3. Where do you typically access Mahany Park open space? Using the above map as a reference, select the access point(s) closest to where you typically access the area. Select all that apply.

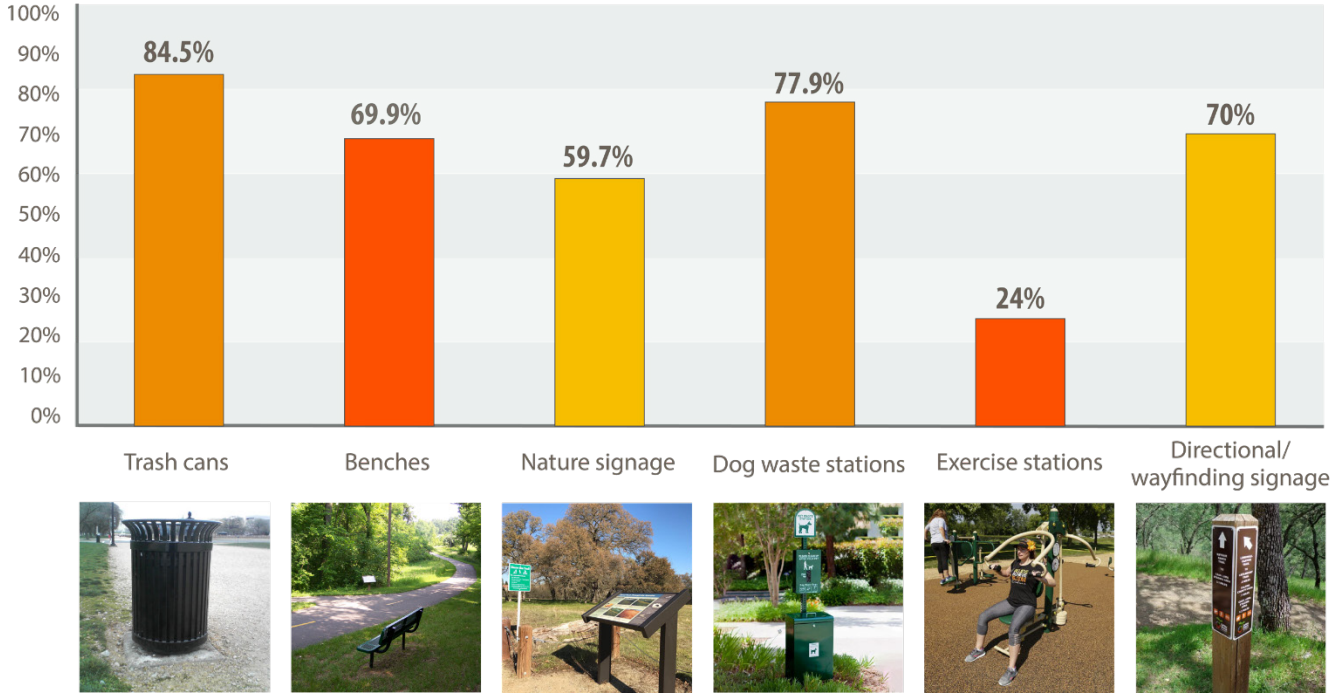


`

For the "Other" category, respondents wrote the below answers:

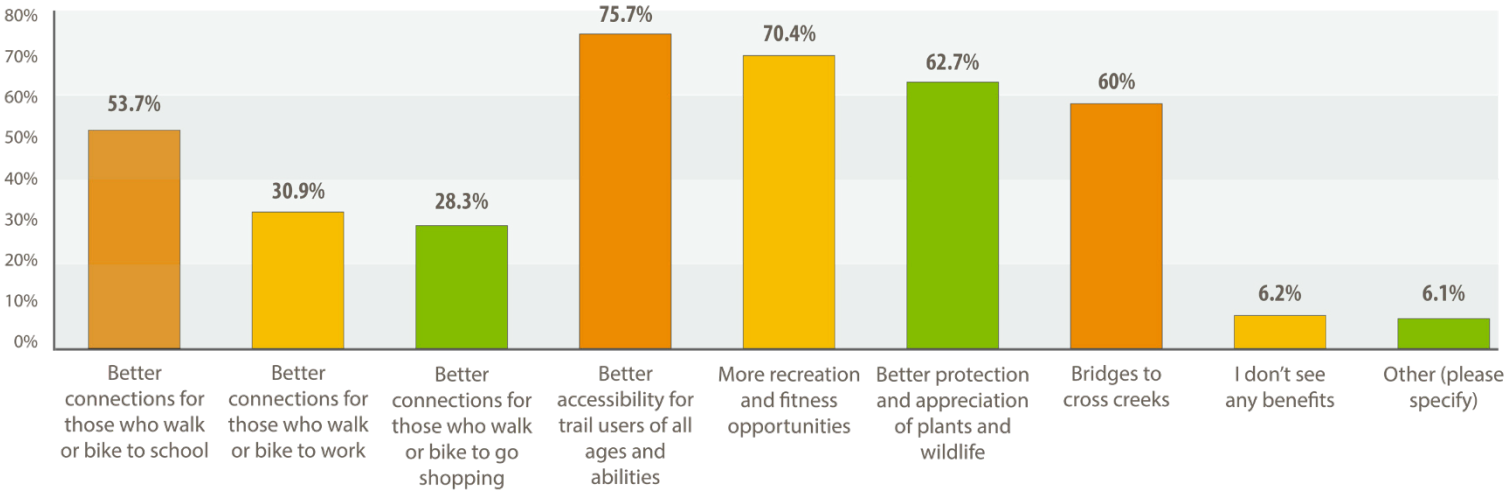
- All points (2)
- Between F and D
- Between F and G
- Dirt trail off of Woodcreek Oaks between Pleasant Grove and the Aquatic Center
- Glastonbury circle, past the fence
- On Junction at the first street west of Woodcreek oaks
- Woodcreek Blvd. and Junction
- Woodcreek Blvd
- The dirt trail off Woodcreek in between Point A and Point C. But we use every single spot.
- Typically from a side trail off Junction Blvd.
- Walk from parking areas
- We go through Sun City Boulevard under Pleasant Grove
- By the all-weather field and the Aquatic Complex

4. If the City were to construct a paved trail at Mahany Park open space, where would you want to locate public access points? Select all that apply.



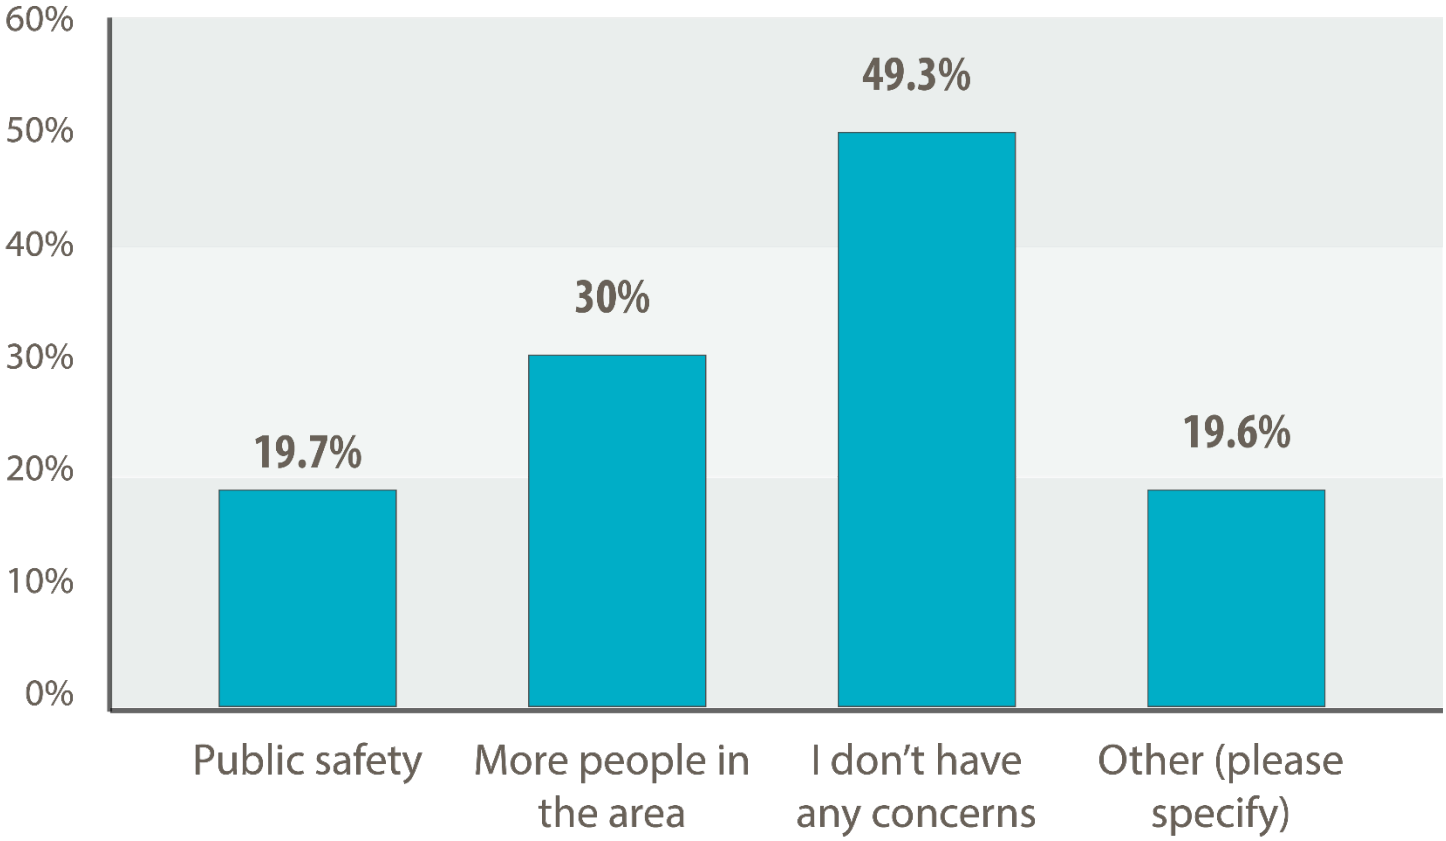
For the "Other" category, respondents wrote the below answers:

- None (13)
- No paving (13)
- All (2)
- An access point with adequate/convenient auto and bicycle parking, and handicap accessibility
- Anywhere there is sufficient parking



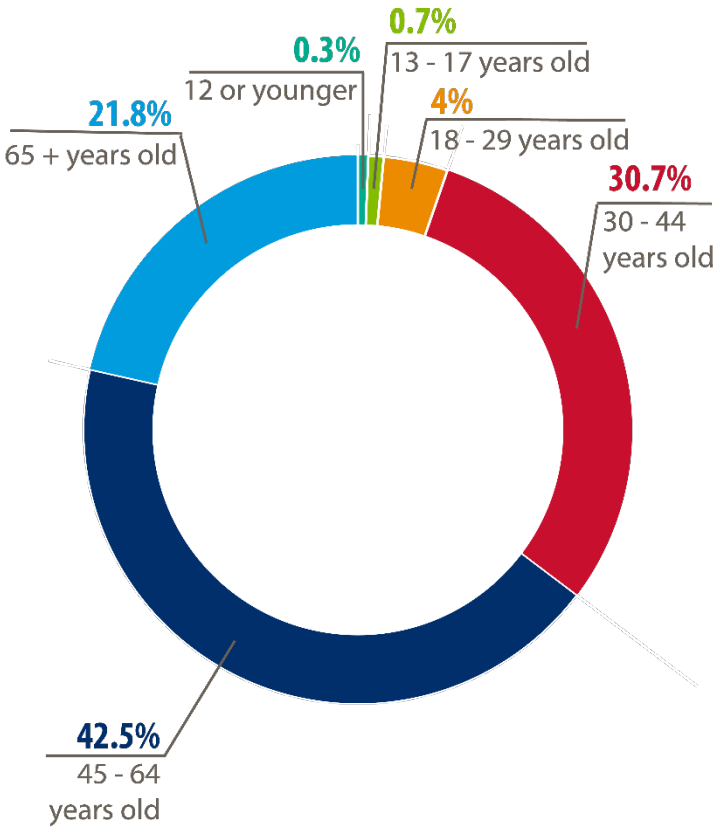
- As many as feasible
- Can you also work on Point M from the existing access points?
- Connect to the trail on Country Club
- Connect to trail from Sun City Blvd. or surrounding area
- Connect with Pleasant Grove Creek Trail
- Connecting from Riverside/Darling
- Corner of Woodcreek and Country Club
- Crosswalk connecting to Woodcreek
- It would be so nice to access from Fiddyment, there are so many walkers and runners
- Mark trail heads and access points where there is parking
- More is better
- Not sure, parking is a consideration. Dog park lot already congested.
- Off Woodcreek Oaks in the field between the pool and soccer field
- Pave Point B to Point E for those in need, but I prefer the dirt trail and run on the side of the pavement anyway
- Please don't put it by H, G, F and E. We live in this neighborhood and don't want to see increased traffic down our streets for people at access the entrances or extra parking on our streets
- We love riding the dirt trails! M is the toughest area to access
- Whatever is most accessible for most people
- Where ever there's parking
- Woodcreek Blvd.

5. Which amenities would you like to see along a paved multi-use trail in Mahany Park open space? (select all that apply)



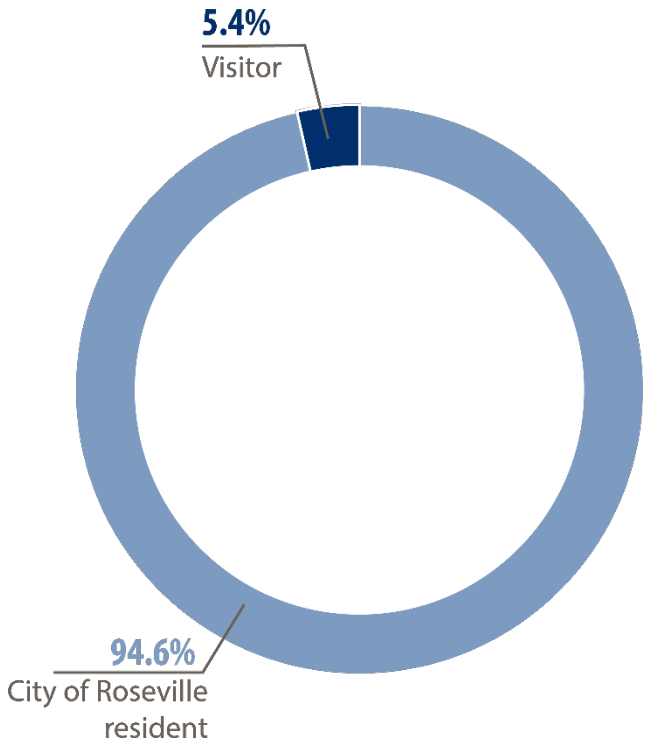
For the "Other" category, participants most often wrote about wanting more water fountains or water refill stations along the paved trail (**23% of "Other" responses**), restrooms or port-a-pottys (**17.3% of "Other" responses**), more trees or structures to create shaded areas (**16.8% of "Other" responses**), bridges for stream crossing (**9.8% of "Other" responses**), some dirt paths specifically for mountain bikes (**5.8% of "Other" responses**), lighting (**4.6% of "Other" responses**), and bicycle repair or pump stations (**4.6% of "Other" responses**).

6. What do you think are the benefits or opportunities in creating a paved multi-use trail in Mahany Park open space? (select all that apply)



For the "Other" category, respondents most often wrote about how a paved trail would provide a safe area for cyclists, pedestrians and runners to travel not next to motor vehicles (**28% of "Other" responses**), provide a better opportunity to enjoy the open space in a natural setting (**16% of "Other" responses**), provide connections to other trails in the area (**16% of "Other" responses**), more opportunities for people to walk their dogs (**12% of "Other" responses**), better opportunities to meet and connect with their community (**12% of "Other" responses**), better connections for those who walk or bike to the library (**8% of "Other" responses**), and better ADA accessibility (**8% of "Other" responses**).

7. What are some concerns you may have about creating a paved multi-use trail in Mahany Park open space? (Select all that apply)



For the "Other" category, respondents most often wrote about concerns over whether or not a paved multi-use trail would disturb or damage nearby plants and wildlife (**24.4% of "Other" responses**). Respondents also noted that a paved multi-use trail looks less natural and might take away from the aesthetic of the open space (**18.4% of "Other" responses**), how the increase in traffic might lead to more litter and waste (**7.6% of "Other" responses**), the potential for more homeless encampments (**7.6% of "Other" responses**), that the cost and maintenance of the paved trail might be too high (**7.6% of "Other" responses**), potential conflict between cyclists and pedestrians using the paved trail (**6.8% of "Other" responses**), and that some people have personal preference to run or cycle on a dirt path (**6.4% of "Other" responses**).

The survey gave respondents the option to leave information about their age and where they live. Below are the data:

What is your age?

Are you a Mahany Park visitor or Roseville resident?

If people answered that they were a Mahany Park visitor, they were also asked to write what city they are from. Below are the answers:

- Rocklin (29)
- Citrus Heights (6)
- Lincoln (6)
- Antelope (4)
- Granite Bay (4)
- Auburn (3)
- Sacramento (3)
- Folsom (2)
- Loomis (2)
- North Highlands (2)
- Colfax (1)
- Davis (1)
- Fair Oaks (1)
- Los Angeles (1)
- Penryn (1)
- Pinole (1)
- Placer County (1)
- Pleasant Grove (1)
- West Sacramento (1)

Notification

The City of Roseville posted the online community survey on the Mahany Park Open Space Trail Project website, roseville.ca.us/MahanyTrail.

Several email notifications were distributed to a database of more than 48,000 recipients, which included residents, businesses, and community groups.

Social media messages were posted on Facebook, Twitter, Instagram and Nextdoor resulting in more than 27,000 impressions.

A direct mail postcard was sent to more than 7,500 households in the neighborhood surrounding the Mahany Park area. Residents were notified of the project and survey opportunity.

Informational signage posted around the open space

Informational H-stake signs were also placed around the Mahany Park open space.

The City shared the informational video via their YouTube channel, website, email and social media.

Additionally, ABC10 aired a news story on the project and online survey.

Postcard mailed to residents notifying them of the survey

Why do you typically travel through Mahany Park open space? (Other)

- Enjoying some nature and peace away from traffic
- Going to Library
- Bike riding
- Getting to and from the sports center on my bicycle
- Wildlife/nature viewing
- Ride bike with family
- Exercise while waiting to get daughter's from school, library, or sport activity
- Visiting family
- Walking while my kids place sports
- Enjoying nature
- Wildlife viewing
- Fresh air, exercise and wildlife spotting
- Enjoying nature and wildlife
- Walk to park, library, bank, shopping
- Going to the Riley's grocery store and Starbucks from my house
- Visiting
- Go to the pool and the dog park
- Going to the Aquatics Complex
- Biking
- Going bus stop, store, and Mahany Park, as well as bike rides
- Finding jumps and pump tracks with friends
- Enjoying the peaceful atmosphere
- Going to CVS or dog park
- Going to Raley's and/or Starbucks shopping center
- Mountain bike ride
- Running errands
- Going to the park
- Riding bike
- I used to work cleaning open space
- Walking to Starbucks or riding my bike
- Bicycle
- Cross country team running
- Rarely use it
- Walking to stores
- Riding dirt bikes with family
- Leisure walk with kids
- Cycling
- Enjoying out door nature
- See the creeks and ponds
- I live near Maidu Park and frequently enjoy the paved trails there and can see the benefits for Mahany Park

- Birding
- When my kids have activities nearby
- Getting to pool and library
- Ride bike
- Bike riding
- Nature viewing
- Enjoy nature
- Relaxing walk after playing tennis at Mahany
- Observe nature
- Bicycling
- Photography
- Bicycle route to stay off of Pleasant Grove
- Observe nature
- Family time, traveling to gym or cafe
- I enjoy seeing the nature. Birds, hares, etc.
- Taking my son to preschool
- Running
- Bird watching
- I bike through here all the time to get out of the house
- I would use the area if there were a paved trail
- Birding
- The only place in Roseville that isn't paved and gives a sense of being out in nature. So peaceful to walk out there for de-stressing and mental health
- Peace and quiet and to find exciting critters
- Just seeing some nature
- Enjoy the outdoors and nature
- Enjoy nature, oak trees, open space
- Photography
- Natural area/oak trees
- Bird watching, photography
- Birding
- Wildlife surveying
- Spend time outdoors, in nature
- Taking kid to grandma's house
- Getting to shopping and library
- Outdoor exercise like walking, running, picnics, nature walks
- A beautiful way to get to the library or enjoy an evening stroll with friends
- School field trip/nature walks, Mahany Park facilities
- Walking to the library and/or Raley's/Starbucks
- Family outing
- Enjoying the wetlands
- Getting to library

- Mostly to access swim complex on bike
- Natural beauty nearby
- Going to stores
- Daily walk
- Cross country and track training the dirt is good for our legs
- Overflow parking for the Roseville Aquatics Complex
- Enjoy nature
- Exploration
- Biking with family
- Enjoying the peace of nature
- We live in Quail Glen, and it's one of our two go-to spots for cycling and family time.
- Outdoor education field trips
- Spending time with our family just out in nature
- Enjoying the beautiful open space with vernal pools and oak woodlands
- See the sights
- Biking
- Birding
- To view wildlife
- Photography & bird watching
- Woodcreek mountain bike team ride-a-thon
- See the spring flowers and be out in nature.
- Enjoying nature or crossing from the library to the water park
- Escaping the City congestion
- Access to Woodcreek library
- Observe wildlife
- Getting groceries
- Going to the Aquatics center, the library, and the Raley's shopping center
- Nature walk/bike
- Walking to shopping/coffee
- Enjoying outdoors
- Getting to the commuter bus stop
- Bicycle
- I wasn’t too aware of this space, but I greatly desire more connect trails like Miners Ravine
- Play with my kids
- Getting to stores
- Kids playing
- Birding
- Go to the tennis courts, go to the library, play with RC cars
- Specifically, Woodcreek cross country uses the space to train.
- Biking
- Bird watching
- Run it for Woodcreek Cross Country

- I'd like to see it connected to Westpark
- Exploring nature with my children
- Nature walks and mountain bike rides, we enjoy the dirt trails
- Running
- Kids walk to school or the library on the path
- Getting to ball games at Mahany
- Getting to the library
- Bike riding with the family
- Just a place to "get away from it all for a while"
- Getting to nearby stores
- Getting to my commuter bus
- Biking
- Taking the kids to get them outside
- Bike to stores
- Would use it for exercise if it had paved trails
- Enjoy the space not next to the traffic/roads
- Walks/bike rides
- Not yet; maybe once it's paved
- Library, ballfield
- Errands, library, groceries, etc.
- Walk to shopping
- Hangout after school
- Bike riding
- Get fresh air, reduce stress
- Playgrounds
- To enjoy & partake if the natural beauty & wildlife
- Enjoying and respecting the wildlife and jogging
- Viewing wildlife
- Biking
- Playing Pokémon Go
- Walking to the CVS
- Going to kids playground or library
- View nature
- Exploring the area and beautiful nature
- Ride my recumbent trike
- Dog park
- Map shown is extremely hard to read
- Exercise
- Going to the bank and grocery store
- Riding bicycles
- For fun/recreation
- Going to the Library

- To enjoy the outdoors
- Casual/relaxing walk
- Visiting the library and park with kids; we park at library
- I've only used it twice and that was to walk to the library with my grandchildren

What mode of transportation would you want to use on future trails? (Other)

- Electric scooter
- Skateboard
- Electric assist bicycle
- Skateboard
- Stroller
- Skateboard
- Long board and rip stick
- Skateboard
- Skateboard
- E-bikes
- I pedal a recumbent trike (two front wheels)
- Adult tricycle
- All
- Skateboard
- Stroller
- Stroller
- Stroller
- Group tours
- Stroller
- Baby stroller
- Electric motorcycle (kids)
- Mountain bike

Where do you typically access Mahany Park open space? Using the above map as a reference, select the access point(s) closest to where you typically access the area. (Other)

- Go through Sun City under Pleasant Grove.
- I access from all points
- Typically from a side trail off Junction Blvd. is our favorite entrance
- All over
- I would like to use
- Woodcreek and junction , right off junction dirt entry before F
- On Junction at the first street west of Woodcreek oaks Blvd.
- Closest access is Point J
- Glastonbury circle, there's a path past the fence
- Walk from parking areas

- Our primary access point is the dirt trail off Woodcreek in between A & C. But we use every single spot.
- Trail heads are not marked. Parking is not provided for most access points
- Between F and G
- Woodcreek Blvd
- Dirt trail off of Woodcreek Oaks between Pleasant Grove and the Aquatic Center
- Between F and D
- I didn't access because I use Miners Ravine .
- We walk on a dirt path between the all-weather field and the Aquatic Complex.

If the City were to construct a paved trail at Mahany Park open space, where would you want to locate public access points? (Other)

- Don't care for paved access points as the ones currently available are adequate
- Connect to trail from Sun City or surrounding area.
- Connecting from Riverside/Darling
- None
- Living in Westpark, Point I is the most critical access point for my family
- Not sure, parking is a consideration. Dog park lot already congested.
- Leave it as it is, just protect the trees and wildlife
- More is better
- None, I like that it hasn't been paved over.
- None of the above.
- Crosswalk connecting to existing bike trail near Woodcreek
- I would prefer to leave the trail unpaved
- Please don't pave any if it
- Do not pave
- None
- Due to it being a natural area, I am concerned about the impact of adding paved trails
- Do not support the new trail as it would create more vandalism and fires
- I'm against paved path
- I do not want a paved trail
- Can you connect to existing paths?
- Can you guys also work on Point M from the existing access points please
- I enjoy walking on natural surfaces
- No paved trail
- No more pavement please
- The only spot that I would like to be paves is the gravel maintenance road
- Whatever is most accessible for most people
- Don't construct it
- None
- An access point with adequate/convenient auto and bicycle parking, and handicap accessibility
- I am not for a paved path

- Please don't put it by H, G, F and E. We live in this neighborhood and don't want to see increased traffic down our streets for people at access the entrances or extra parking on our streets
- As many as feasible
- None. Don't need any more access points
- Pave Point B to Point E for those in need, but I prefer the dirt trail and run on the side of the pavement anyway
- We love riding the dirt trails! M is the toughest are to access
- It would be so nice to access from Fiddyment, there are so many walkers and runners, CVS, etc. there are no stores for food in the west park area, so it's so helpful to access from walking trails
- Any
- Should not pave
- Anywhere there is sufficient parking
- Connect with Pleasant Grove Creek Trail
- We don't need more access points
- Mark trail heads, access points where there is parking.
- None
- Corner of Woodcreek and Country Club
- Please don't pave the trails. I don't want to bring more people to the area or have people parking in our neighborhood to access the trail.
- Mostly H because that is where I live
- I would like it to stay a dirt trail
- Woodcreek
- All marked
- Where ever there's parking
- All
- None
- None
- None
- Let what nature we have be left alone
- Connect to the trail on Country Club
- Not by the dog park. Parking is limited there as is.
- Off Woodcreek Oaks in the field between the pool and soccer field
- None

Which amenities would you like to see along a paved multi-use trail in Mahany Park open space? (Other)

- Benches with shade
- Picnic tables
- Trees planted near benches
- Tree cover/shade
- Signage on the bath way for walkers directions with arrows and bikers direction with arrows
- Picnic tables, bridges across drainage/creek on interior near access point O (permanent to replace non-compliant ones removed)

- Drinking water fountain
- Plant more trees for shade and possibly lights?
- Grass for picnic and movie in park: skateboard area
- Shade for benches or rest stops
- Roller blade areas
- Port-a-potty
- It should be well lit at night, with cameras. That's if it will be available to use at night.
- More markings for bikes right, pedestrian left
- Shade trees
- Some dedicated dirt trails/dirt features for bikes. There are quite a few parents that use this area to teach mountain biking basics to 4-8 years old. These features have been a great feature for Covid-19 PE class for both of my kids. It would probably be significantly cheaper to study how to create these features in areas that do not do harm to plants/animals instead of paving over the area. Building a pump track where the current paved trail and the main dirt trail meet would be of great community benefit and prevent the current dirt trails that causing problems in sensitive area to diminish.
- None
- A sign showing how far major cities are from that point (ex. SAN FRANCISCO - 100 Miles, TOKYO - 2,000 Miles, etc.)
- Restroom
- Shade structures or more trees, footbridges to cross creeks, lighting for evening use
- An updated map of Roseville trails, bike rack/lock areas near bathroom, trees/shade, water, clear direction for which side of the path to walk or bike on
- Parks and playgrounds
- Planted trees along the trail
- “Stay On The Path” signage. Shade stations.
- Tiny BMX tracks
- No amenities
- Benches, please don't encourage more dogs
- Covered structure over benches for hot days, signs for pet owners to keep dogs on leash
- I'm a casual mountain biker so prefer the dirt trails that are already there. They are great for walkers and bikers provided you don't have a street bike.
- Plant additional trees for future shade
- Bridges across the creeks, more trees/shade, drinking water
- Rebuild bridge over creek, it’s rather rickety
- Garbage cans
- Bathrooms and drinking fountains
- Rebuild bridges over water ways
- Bike tool rack and drinking water fountain
- Water resources
- I see signage regarding pet waste, but no trash cans. They would be the priority.
- Lighting, emergency phones, trail loop distance markers, and bike speed limit signage

- Please don't take all the dirt trails away. It is easier to walk on for the body than pavement.
- Mileage reference markers
- Don't pave it and no exercise stations - keep it as a natural preserve to the fullest extent possible; with least intrusions. Even if paved path, people will still go off and it will encourage bad use of motorcycles, skaters, golf carts, etc.
- Shade trees near the trail
- Picnic table at the top of the hill to watch the sunset
- Source of water/solar fountain for wildlife drinking during hot days of summer
- Just trails only
- Appear to be vernal pools and wetlands. Is there potential for educational and scenic viewpoints.
- Shade
- Bridges across streams
- Please don't ruin this space by paving.
- A simple exercise circuit as you walk or run. Bike tire pump and repair stations like on UC Davis Campus
- Bike ramps for kids, fairy garden
- Creek crossings
- I like it the way it is. I like the natural open space.
- Hills for training high school cross country runners and public exercise, rolling hills turns not just a flat paved road
- Water fountains
- Emergency pulls/phone, picnic benches, bathrooms (closed at dark), repair under bridge access point ('O') and thank you for considering. Similar to the Stevens Creek trail in Mt. View/Palo Alto
- Picnic areas, parking
- Restroom
- Need a permanent bridge across creek
- Sanitizing stations
- Water
- Bathrooms, drinking fountains, solar lights, shade where it doesn't exist, bike part tool stops
- Drinking fountain for people and pets; covered rest area
- Directional arrows and partial mile markers (steps)
- Let's not go overboard, less clutter is better
- Don't construct it.
- Restrooms
- Please protect the oak trees and vernal ponds
- The less the better. Keep it natural.
- Designated unpaved trail (2 to 3 feet wide) adjacent to the new designated paved trail to provide dirt jogging (easier on joints and part of why I go there to run) over other trails in the city
- Bathrooms
- Accessible bathrooms, secure bike parking stands, potable water faucet/drinking fountains, shade/trees, lighting at night, mile/distance markers, inconspicuous exercise stations, grassy areas to sit and exercise/stretch/rest, drought resistant plantings/wildflowers

- Water fountain to add water to your bottles
- Trail volunteer group
- Water filling stations or fountains
- Water fountain, restrooms
- I walk these trails almost every day. The dirt trails are well used and most walkers/runners/bikes do not go off them. One area I have a concern for is the creek crossing in the large oak grove. A few years ago a bridge was in place to cross. The city removed this bridge. Since I have seen alternate paths made to circumvent that spot. I have also seen the Woodcreek High School track team crossing that spot (when it's dry) with a few galls and stumbles. I would suggest the city places a path through the grove with a well-designed environmentally friendly bridge there
- Bridges keep people and dogs on the trail. Lack of bridges and people create their own no matter how many times your staff removes them.
- Kids play structure
- Bike skills park
- Photo opportunity spaces
- Keep some dirt trails to provide variety for bikes and joggers
- I love the idea of nature signage but find it becomes hard to read after a while. Perhaps too much sun? Seems a waste of time and resources.
- Restrooms, water fountains
- Bridges for creek crossings would be great. Also, the gravel path on the side of the paved path is fantastic for older runners! Lastly, a bathroom and water faucet would be incredible at the west end of the land down by Fiddyment.
- Water access
- Shade
- Dirt jogging path next to paved trail
- Newly planted oak trees and other native species
- Restrooms
- Restrooms, water refill stations
- Restrooms or ADA port-a-pottys
- Mile markers; decorative/aesthetic bridges or crossings; photography spots
- Pull outs for hikers and bikers to rest, without stopping traffic or damaging sensitive terrain
- None
- Food. It’s like a dry desert out in west park for kids whose parents work full time
- Water fountains
- Shade
- Water, creek, pond, bridge, use to be so nice
- Restroom/water fountain
- Trees for more shade. The trail itself is to exposed for summertime activities.
- I want the space left natural
- Create shade! Plant trees. Install shade structures. Add water stations for people and dogs.
- signage pointing to water and restrooms close to the trail
- Trees for more shade

- Put a divided line on the paths one side for walkers only other side for faster movement, joggers, bikes skaters etc. and they stay in that lane coming and going, they don't switch lanes depending on direction of travel. Roseville needs to fix all the paths that are throughout the city like this, too many close calls or accidents with the switching of lanes based on your direction. The current method doesn't work, very dangerous!
- Keep it natural
- Lighting
- Quality trail bridges
- Safe drinking water
- Mileage on trails
- Off road, dirt mountain bike course
- Trees. It's too hot for the humans and animals not to have covered pathways
- Shaded areas with trees or other for the benches.
- Water
- Shade trees, water fountain
- Signs for runners bikers
- None
- Lights
- Maintain dirt trails in addition to paved trails
- Replace the bridge that was removed by the city
- Restrooms
- All of the above complete take the nature out of this area. It's enjoyable to have a dirt area to enjoy.
- 10-12 ft pathways
- Bridges over the creeks
- Bike racks, water
- Plant more trees along the path
- Hydration station, also please don't remove the fairy garden.
- Water fountain, shades
- Some shade trees
- Water fountains/bathrooms
- Keep it minimalist so it still feels like a preserve
- Water station for people and pets
- Right of signage
- Drinking water
- Children play areas
- Restrooms, water bottle refill station
- Playground
- Water fountains, bathrooms
- Bathrooms of some kind
- Restrooms
- Bike/walk directions. Bike fix it stations, air pump
- Restrooms

- Water fountain
- Water fountains, doggie water fountains
- Water refill stations
- Perhaps a water fountain for thirsty walkers
- More doggie pots
- Bike tool station
- Some kind of toilet system
- Nothing but walkers so wildlife can continue to prosper
- Picnic areas and less ditches
- Sundial, right away signage
- Emergency phones; distance readings on the different directional posts (1 Mile, 2 Miles, etc).
- Bridge over the creek
- Water fountain, nearby public restroom
- Bike repair station(s)
- Shady areas
- Lots of signs reminding people dogs are to be on leashes
- Bathrooms, solar powered LED trail lights, bike tool stations
- Bathrooms. Runners and cyclists need them along the trails.
- Water fountains
- Bathroom please
- Restrooms
- Natural surface trails with erosion control
- Water fountains
- Hopscotch, simple play structures, picnic tables, bathroom
- I love Roseville's trails and parks.
- Bike park, we have very few in Roseville

What do you think are the benefits or opportunities in creating a paved multi-use trail in Mahany Park open space? (Other)

- I enjoy how much of Roseville you can cover without going on the main streets
- Safe place without traffic to bike/walk
- Opportunities to enjoy open spaces rather than being next to traffic
- Social opportunities within the community
- Neighborhood morale and comradery. Less traffic as more opportunities to bike. Increase the beauty and respect for others and their community. Increases safety in the area by having more accessibility for others to be involved and helpful in cases of suspicious activity. Less opportunity for mischief by those foraging through open areas.
- Joy of picnics and movies in park; potential live bands with food trucks
- I avoid area in summer, too many bull horn thorns
- Community interaction is facilitated on the trail rather than car
- I love the nature. The paved trails are not necessary.
- I can ride my bike to the pool or library

- Better connections for those who walk or bike to the library and aquatics complex
- Expansion of biking trails to connect with other biking trails
- I feel like what makes the Mahany trails is having the dirt paths to go exploring or make jumps to have fun with on your bike
- Better connections to walk dogs, ride bikes locally without being on busy road
- Benches are the only improvement, the rest create ugliness in a beautiful natural setting
- A paved multi use trail will bring more people to the area and more disturbance to the nature preserve.
- I love riding my bike and running on the dirt trails, so I am somewhat hoping to keep some trails unpaved. But I do see the possibilities for improving access for kids riding to school, or even adults riding to the store for groceries/shopping.
- It could help reduce the amount of dogs walking through the baseball complex, and reduce the risk of concern for a child or adult getting bit.
- I like it the way it is. Natural looking trails. Keeps traffic down. The paved bike trails, and sidewalks are taken up by non-courteous walkers and bikers
- Picnic tables
- Bikes and motor bikes can be a danger
- Paving a bad idea. It is a preserve, so it should be kept as natural as possible with limited use by all.
- Cycling
- Connecting to other Roseville paths would be great for biking through and enjoying more what Roseville has to offer
- I hope it will result in better protection for wildlife
- Beautiful natural space. Conserve it but somehow make it more accessible.
- Larger connected multi use trails
- Disability access, but otherwise detracts from nature feel
- Connect to existential trails throughout the area so you can bike long distances safely not just within one park. Make the parks connected and think outside of just this park. Think about making it safe to bike to Sacramento or Folsom or Rocklin
- I like it the way it is, but a bridge to cross the creek would be nice
- Maybe one very simple bridge across the creek near the pleasant grove overpass near Sun City entrance
- Elementary field trips, middle school and high school athletes and teams can have practice and train daily
- Increase dog walking areas, Safety as the trail is already used but more safety would be better, less chance of hurting yourself with a paved road.
- Reduces natural setting, becomes urban
- Beatification of the area
- Love the trails but don't understand why everything needs to be paved
- Fun
- I think what makes this park special, is when walking on the dirt paths, you feel a deeper connection to nature and greater appreciation for the plants and animals. It feels set apart from regular parks, it’s not overly maintained and that’s what makes it special
- Adds to attract more families and people to live and recreate in Roseville
- I am for improvements but just not paving the paths. I love to go jogging there and the reason I go is because it is one of the only places left

where I can run on a natural surface (dirt). If I want to run on cement or a road I have every street in Roseville. This space should be improved but left as natural as possible

- I see a number of folks with strollers
- I would not want any paved trail over existing bridges or creeks
- I enjoy being on the trails that exist without paved roads. The ones that exist just get graffiti on them.
- Meandering dirt paths are a pleasure. Paving will remove that pleasure. Please do not install barriers to dirt paths.
- I enjoy the feel of the blue oaks trail system- mixed of nature/ dirt trails and the paved trail system. Replacing the gravel trail and having an entrance by the dog park would help.
- It's safer to ride on the trails than on Fiddyment, Pleasant Grove or Blue Oaks
- Overall connectivity throughout the city
- Dog walking
- Shade trees
- Places for families and dogs to just play
- Safer options to ride bike, walk, etc.
- Outdoor quality of life is why we love Roseville
- Access to library and sports areas
- Please connect all trails. West Roseville had a few and they are not connected. Driver's do not respect bikers
- None
- Less goat heads in my bike tires
- Easier areas for Geo caching
- Wheelchair bound usage
- Walk baby stroller/paved vs gravel
- Reduced traffic congestion from driving cars.
- Safe place for joggers to use away from vehicle traffic
- Will all trails eventually connect?
- The dirt trails are fun the way they are
- Again, leave it alone. It's absolutely perfect in this natural state.
- I have lived here for 12 years and have seen what people have done to this entire area. You removed a once viable bridge and forced people to destroy it even more by forging new trails. Off road and gas vehicle have been used within the area and vernal pools and habitat will be destroyed, not preserved as you state.
- Safe location to exercise away from the dangers of city streets and traffic
- Restrooms
- This project has the potential to transform the open space preserve from a barrier to active transportation to a veritable hub of it.
- Better access for kids to get to school without damaging local wildlife
- Right now people just do whatever they want, wherever they want in the open space. I know because my apartment faces the preserve and I see it every day, all day long

- It would be great if, eventually all the trails tied together somehow. Maybe a break here or there logistically but overall having one cohesive trail makes sense.
- I would prefer it to remain unpaved, it's significantly better for joints to keep it an unpaved trail

What are some concerns you may have about creating a paved multi-use trail in Mahany Park open space? (Other)

- Pavement is hot, we need more trees
- I would prefer unpaved
- Cost to tax payers
- None, it is an underutilized space with a lot of potential
- Not enough access points so people will stray from path. Maybe add minimum barriers on each side and signage to protect wildlife/vegetation.
- More people generally means more litter and disregard for natural areas. Dog waste and drink containers seem to be prevalent in other areas of town.
- Litter in the open space if not enough receptacles
- Maintaining Woodcreek High School nature docent program that educates younger kids; possible negative environmental impact
- Proper use of trails
- Trash and traffic may cause more damage than noted today.
- Nature preservation
- I don't think that the current path is an issue.
- Maybe a walking path separate from the biking path to avoid collisions.
- That the costs of the trail were not already paid for using regional park fees the several specific plans in this area.
- Fire safety during summer months. Also using goats for brush clearance must continue.
- It would disrupt the nature and animals more if there are more people that use the trail
- People still not staying on trails and still causing damage to wild area.
- It's open space, natural and open. More people means more trash, dog poop etc.
- More use more litter
- Mountain biking isn't the same on pavement
- Loose dogs from the dog park concern me.
- Costs
- Potential for more people to go off the path and damage the ecosystem.
- Cost and maintenance. Seems like Roseville is already concerned about revenue.
- fencing on trails that limits access and creates congestion
- Destruction of wildlife
- Don't need a hangout space of any kind
- More paving over. More unnecessary and ugly improvements
- I can access the area from my back yard, and I don't want more people within sight of my yard.
- Destruction of natural habitats
- I am older and still jog every other day in Mahaney Park since it opened in the early 1990s. I cannot jog on pavement anymore, must have dirt or the gravel road. I want that to continue somehow.
- More trash.

- How it affects wildlife in the area. How waste is controlled.
- Would there be crushed gravel shoulders for runners?
- Protection of land and animals
- Please keep some dirt trails, pavement gets hot
- Decrease of nature there
- I don’t want to see this area paved over.
- Toxicity of pavement, increased traffic, less observance of nature but instead a focus on speed of getting thru the area, and if there will be a budget to continue to maintain the trails.
- Prefer dirt for mountain bike use
- Homeless camps
- NIMBY pushback by local residents adjacent to proposed paved multi-use trail and complaints from same group if/when paved trail exists
- Dogs and bikes don’t mix very well. The dog could get hurt and/or the cyclist could crash and be severely injured.
- Damage to wetlands, nature preserve
- I don't think we need a trail in Mahany Park. I think a skatepark would be a better choice to build.
- Creating a paved road through the wild life area concerns me greatly. I absolutely love the natural paths that are already in place. It is absolutely possible to bike through the paths as they are. My least favorite part of the existing paths is the rocky trail going from the aquatic center. I wish it were more of a dirt trail.
- Make bridges rated for fire apparatus
- Loss of dirt paths that make it feel more connected with nature
- It won’t be used if not properly connected
- Environmental concerns such as what the pavement and amenities would do to wildlife.
- Dogs not on leashes on the trail, width of trail, and litter
- That you will ruin its natural beauty by paving it
- More people, more chaos with skaters, bikers; more vehicle traffic drawn to the area. Roseville is getting over run as it is.
- Bicycle riders taking over.
- I think keeping the open space as natural as possible without any pavement, etc. is very important
- Taking a mostly native open space preserve and turning it into a paved and manicured greenbelt
- Impact on wildlife.
- Clear signs indicating trail use etiquette
- Teens already use motorized scooters, the problem will be worse if on a paved path.
- Litter/pollution in creeks
- Dirt/gravel is easier on the feet/knees for walking/running
- People confusing open space with a park.
- Too much paved space that doesn't retail natural open space look/feel
- Unintended damage to wetlands
- Impact on the natural ecosystem
- Still having non paved paths - would like to have this option
- Fires and vandalism to the existing trees and habitats, problems with people riding dirt bikes also.

- Fires during the summer, area is overgrown
- One more area we lose to cement. Roseville is becoming less and less green. There are plenty of sidewalks areas, very few natural paths.
- High cost for implementation
- Open space preservation
- Taking away other current trails
- It takes away from the nature and is not necessary
- Destruction of the natural ecosystem
- I like it the way it is . I like the relaxed open space and the ability to wander wherever I want to go . If you put a paved ride into it then all the cyclists will claim it and change the whole feeling if it. I say that as an avid cyclist. It will turn out like the one from foothills to Fiddyment just a boring paved road. Please don't change it .
- Plants and wildlife
- Trash
- Disturbing the wildlife that lives there.
- I think that one straight paved path from Woodcreek to Fiddyment is perfect and all other trails should be left as is
- Leash law signage
- Increase in the homeless staying there
- That it will no longer feel like a natural space. It is so difficult to escape this concrete jungle. It will feel more like a park.
- Impact on wildlife by making it more accessible by people and associated litter problems
- Homeless gatherings, hangout for kids late night parting, bad people destroy the nature but the benefits far outweigh these points.
- Reduces natural setting, becomes urban
- Dogs off leash
- It will ruin the atmosphere of a wilderness area. It will make it seem more modern, and many people enjoy the sense of adventure when going through the wilderness area, and with a paved path, it will ruin the sense of adventure.
- Concern about it looking like a road, with fast bikers, etc. Prefer it to be a smaller natural trail
- Protection of bird habitat
- Why can't we have some elements in this city (concrete jungle) that are natural?
- The current dirt paths have a more nature feel to my walks and jogs.
- Wildlife and habitats of animals plus I enjoy the rustic nature feel about it. It's an escape.
- Who will pay to build and maintain it? More taxes?
- Crowding out animal inhabitants
- Small paths that don't provide even space for social distancing.
- Property taxes to pay for path, maintenance and police
- Bikes are a hazard for hikers. Bikers are usually clueless about the risk for injury to pedestrians
- I'm concerned that Roseville is not focusing on the needs of citizens in West Roseville who have been waiting more than 7 years for essential services like grocery, retail and gas stations.
- Habitat disruption

- People need to know the rules of the road.
- The wild life will leave
- Loss of wild space. Putting a trail in will rob the area of its natural, raw feel.
- The oak trees and vernal ponds
- Environmental Damage
- Concern for wildlife and plant preservation
- Open space is the only accessible dirt trails nearby; I don't want to lose the only place to go bike casually on dirt.
- Traffic increase during construction.
- Grafitti
- Environment
- Avoid damage to Oak Tree root systems
- Environmental. It's not a pristine area but is functional, maintaining that function during construction would be a concern
- Cost - can the city afford this?
- Cyclists speeding and not observing posted speed limits.
- Damaging to the existing nature in the preserve
- Loss of aesthetic and authenticity
- Adequate parking and handicap accessibility
- Currently these dirt and rock trails are perfect as is, quiet and relatively unknown, and a nice place to walk and hike in the little hills. I fear that adding a paved path will take away from this as it will become much more used by bikes who tend to go much more fast on paved trails vs the dirt and rock that is there. I don't want it to lose its serenity. I also don't want to see increased traffic down our quiet streets or extra cars parking on our roads.
- Dogs off leases is a common issue
- I enjoy trail riding so would not want to see many paved trails
- Graffiti/ trash. We enjoy the open space because there are less paths. We use it every day and why we moved here. Don't want it to be a formal recreation area
- Safety of wildlife during construction
- I think the area may lose some appeal as a natural/undeveloped area. I enjoy the packed dirt trails and the way they are part of the land. I'd love to see some bridges over the creeks/ditches, and perhaps paving of the wide, straight roads. However, I don't want to the place to become just another city park.
- Costs
- Disturbing wildlife
- Destroyed environment
- Keeping the open space vibe
- I enjoy the natural feel of the trails the way they are.
- Potential accidents if bikers and pedestrians use same path
- Cost. We are suffering a pandemic and loss of wages and jobs. Some people cannot afford food and you want to spend this money on a trail? More space for homeless in Roseville.
- Barriers between pavement and dirt paths. Keep dirt paths accessible.

- Balancing water retention and plant habitats
- Would clearly defined dirt trails be ok? Would help keep a more natural feel, retain less heat and perhaps less long term maintenance expense.
- My initial concern would be that it would remove/ reduce the amount of dirt/ nature trails.
- Vandalism to man-made or natural habitats
- Losing unpaved trail access and use
- Accidents. Cyclists go fast. Kids on scooters are all over the place. Dogs on long leads. Slow walking vs fast. There is just a lot of potential for conflict.
- I see this as a benefit
- Protection of habitats
- Pavement is hot in summer months and can burn the feet of dogs. Leave it alone.
- Educating walkers and bikers on right of way and courtesy. It appears that students and senior citizens might frequent the trail. Perhaps a bike speed limit would be needed. Directional arrows as on the Pleasant Grove trail for walkers and bikers would be a must.
- Disruption of wildlife and native plants
- Wildlife safety
- Taking away from the natural dirt trails that runners/bikers like to have access to
- How construction will affect existing wildlife.
- Unleashed dogs
- Easier access for homeless
- Shrinking nature's footprint
- Cost unnecessary
- Ruining natural splendor
- Wildlife
- Why must every park be developed?
- High speed bicycles. Vandalism
- Nothing wrong with it now.
- First a paved surface in the summer heat of Roseville would be DANGEROUS for dogs! Bicycle riders would dominate the path also endangering the people walking their dogs. Bikers go too fast; many bikers don't indicate they are passing and many bikers expect walkers to move off the paths to make way for the bikes.
- Wildlife safety
- Misuse by those who don’t care
- May not be used as much and can ruin the feel of nature
- Dollars spent when they are scarce.
- Unleashed dogs and amount of trash and dog waste.
- Cost
- Losing the nature feel of the trail
- See my concern above about path directions on safety.
- The same dirt trails have been there for years. People like exploring the little dirt trails and I think that keeps them from randomly making new trails.
- Maintaining a protected open space for plants and wildlife
- Ruining the cool natural trails there now

- Animal safety and preserving nature
- Bathroom
- Homeless camps
- I am concerned that it is pointless.
- Less dirt trails
- Having to read and listen to NIMBY neighbors.
- Homeless camps
- Likely runners and dog owners will still utilize dirt path next to black top as it is less impact for runners and not as hot as black top for dog paws
- Industrializing nature areas
- Removing access to all dirt trails. It's better to run on dirt.
- Loss of suburban cross-country bike trails
- To be honest, I enjoy feeling as if I'm more connected with nature while running on a dirt trail, and I'm afraid that the paved road would take away that aspect. Especially because paved roads are large and unnaturally colored. It would also smell like asphalt for a while.
- Habitat protection
- Restroom access
- Paving the area. We often see wildlife on the dirt trails. I don't see a reason to introduce more pavement to gravel to their environment.
- Trash
- Homeless attraction
- Homeless
- Disruption of wild life and landscape of the open space
- Negative impact on nature; one of the best things about walking along there is that it is more like hiking than walking on a sidewalk.
- Would like to see park rangers
- There are many paper trails and not many dirt trails I would like to see this day a dirt trail
- Takes away from the natural feel of the area
- Encampments
- That we protect the wild life - plants and critters
- Homeless people-safety issues
- Keeping clean, no trash
- I would use the paved trail, but we also enjoy the use of single track trails. They add an extra experience to recreation in the city.
- Lose the sense of wildness
- Losing the wild feel/nature
- Preservation of the flora and fauna
- Trail bikes running over walkers
- Environmental impact
- Social distancing
- Increased trash

- I enjoy that the area is natural and undeveloped. It is so much cooler to get away from all the houses and pavement in the summertime. Too many paved trails would ruin the area.
- criminals tend to hide in these types of "off the beaten road" trails. Female Jogger/walker safety is a concern.
- I prefer dirt trails.
- Too much traffic that might negatively impact wildlife
- Environmental preservation and prevention of damage to habitat due to increased ease of access to sensitive areas.
- More trash
- Homeless
- Allows access for new homeless encampments
- Asphalt, runners and road bikes going 25 mph don't mix
- The dirt trails are fine the way they are, it is nice to not always be on pavement when running or biking
- Not a good use of City money right now
- Bicyclists are dangerous and do not share the road. Let me use the existing bike lanes we as taxpayers already paid for.
- Ruining a fragile ecosystem with more concrete and people.
- Attracting homeless camps
- Litter management
- Waste human trash and dog poop/bags
- Homeless encampments
- Homeless and drug users
- Less extensive trails and access than currently exists
- Unsafe crossing areas
- Homeless camping out
- Natural habits getting destroyed
- More concrete, the more heat the surface retains particularly in the hot months.
- Trail width. When trail are busy it can create safety issues. Minimize impact to natural resources, while creating opportunities to view and learn about natural aspects.
- If adequate connections are not provided, the existing issues with volunteer trails will continue as the new path becomes more of a magnet for users. Maximizing connectivity is critical.
- Natural surface trails are important to protect. I don't think a paved trail is needed.
- I like the dirt trails
- Cost
- Well there are coyotes out there we see them at night outside the dog park area fence. Other problems I would see teens vandalizing stuff. Homeless camps and drug use will become a problem
- Littering - having trash cans and dog bag stations is must
- Creating a trail without public bathrooms
- More people without some sort of enforcement to rules could do more harm than good
- I ride mountain bike there as does the Woodcreek high school mountain bike team. Pave only what you must and do not close access to the dirt trails.

- Whether paving will disturb wildlife habitats more than walking on the dirt
- This may reduce numerous alternative paths created throughout the area
- Loss of natural surface trails
- We love that there are currently several dirt trails that are fun to bike on. It would be great to keep some of the trails as dirt.
- Homeless camps and increased trash
- Cost, is this an appropriate use of funds during Covid?
- Unpaved trails are significantly better for joint health and connection to the outdoors
- Where does this money come from?
- Disruption and destruction of environment

If you are a visitor, what city are you from?

Do you have any other comments or questions about the Mahany Park Open Space Trail Project?

- Thank you for providing an opportunity for our input. I would like to see the city implement as much uninterrupted bike trails as possible. Stopping at a major intersection and riding on busy streets keeps me from biking locally. My wife and I prefer taking our bikes to the ARBT. Question above regarding if safety was a concern - our concern is for wide enough trials for bikers and walkers. Thank you again.
- Please plant more trees and stop cutting down adult trees. We need more shade and greenery in Roseville
- A trail would be so helpful for residents to get to the Roseville Sports Center, Riley Library, and the Aquatics Complex without getting in the car!
- Overall I actually like the space as is
- I really enjoy riding through this space with the kids on adventures, and it did strike me as odd when we started using it that there are random trails that end in nothing or in creeks. It would be great to focus on a paved system that protected the creeks and kept people from randomly exploring more sensitive areas of the space.
- Please make sure to add signage to indicate directions for walkers/joggers and bicyclists along entire route-either by painting on the path or signs.
- Plant more plants/trees, otherwise I appreciate this park
- Having at least one restroom/port-a-potty in the area would be so helpful. Not everybody has a home nearby when the need arises.
- I believe we can have a good balance of preserving nature and having people be out in nature so that they can both enjoy and appreciate it. Also, we have had Scout nature walks there. I learned a lot and I would like school children to have that opportunity. That is also why I like the idea of nature signs.
- Please make this trail happen. It is so unsafe currently to have to walk, jog or bike along the busy fast paced roads around the area. Our poor kids have to ride their bike along Fiddyment to get to school as huge trucks whiz by at 50 - 60mph.
- Will the building of the paved trails seriously disrupt wild life?
- I fully understand the desire to better protect the wildlife and natural areas. Would it be possible to create dirt trails - meaning control which ones should be used with the normal path fencing (posts with a cable), but leave the pathway dirt? My family uses the space both for bike riding - kids love to ride on dirt - and for running, as a dirt is far better on your body than pavement. So rope off where I can and can't run/ride to control some of the off-road stuff, but leave it dirt!
- Have a butterfly house. Use Roseville's summer heat and solar power, as an attraction and place to go, learn, enchant.
- I really appreciate all the great trails in Roseville. I am excited about this project.
- This is great.
- Please do not lose the nature part of the area.
- I think paving a trail would be a waste of materials. Growing up in the area, I've never had an issue accessing the trail space.
- Please connect this trail to the riverside/darling access point.
- I really like the idea. My wife and I recently moved from the South Land Park Neighborhood. I was on the board for SLPNA for 8 years, and was also very active in getting the Del Rio Trail project started.
- Make main use trails wider than side branch trails

- Would be great if this trail was expanded to other areas in Roseville, like a protected bike lane down Woodcreek and along baseline. Getting from baseline to Mahany can be dangerous
- Thank you. We moved to Roseville because off the bike trails. More trails would be welcomed.
- I would prefer that the repair and maintenance of the trail around the outside of Maidu Park and other areas of the City take precedence over this trail when using non-regional park building permit fees (which are intended for construction of these types of projects).
- Consider paving the gravel parking area next to the aquatic center for trailhead parking. Trees along the trail would be nice to keep it shaded in the hot summers.
- Build a little bridge that crosses behind the dog park off the paved main trail. So you can go directly from Alsbury all the way straight on the path to Pleasant Grove
- As a senior, I am not comfortable walking on non-paved trails so this would add a very nice opportunity for me to get into a more natural setting for my walks.
- I think it is a great idea to have some wonderful pathways.
- Leave it alone, it is a great place to take a respite from all the noise.
- Please do not add a paved trail. Do not disrupt the space any more
- The trail should be extended into West Park
- Also include signage for trail etiquette: i.e. regarding trail markings (e.g. which side to walk vs ride a bike) and sharing the trail.
- I'm completely in favor of this project.
- I think it's a great idea to have a paved controlled access trail, both for the sake of trail users and for the wildlife
- Drainage on the path of the pedestrian undercrossing near Sun City needs to be address as there is always a muddy area to traverse. Also graffiti has become an issue and needs to be addressed more quickly. I would love to see footbridges to cross the creeks, which swell during the rainy seasons, making the areas impassable.
- Makes sense to at least pave the existing gravel road and to complete the trail from E to M, connecting to Pleasant Grove Blvd. near the dog park.
- I would love to leave it the way it is and has been. Just because the city of Roseville keeps allowing thousands of people to crowd in here, doesn't mean we need to ruin what has been open space with NO paved trails. Want paved trails, pick a different place. We live right next to it and don't want all the people, trash, and noise that will come. The graffiti, litter, and dog poop is enough already! And garbage cans don't look nice in wetlands. Just saying.
- How many access points will there likely be?
- I have noticed a lot more bicyclists going off trail. I hope this will somehow be discouraged in the future. They go through the grass and wild flowers.
- I would like to see it connect to west park with a tunnel underneath Fiddyment.
- I think it would be a great amenity for the community and a great use of the space.
- The more trails the better!
- I love the idea of a network of trails to use in that space and look forward to completion when I can start using it.
- I'm very pleased that this is being considered and look forward to the grand opening of it.
- How long will it take to finish all of this?

- I would like to be able to cross creeks. I would also like to be able to use inline skates on the trails.
- Thanks so much for addressing this important need! Please make sure this is accessible from Fiddyment!
- I think monies should be maintained to cover the expense of goats for fire protection. And removal of dead trees on trails that could be a hazard. At this time no other money should be spent on this while independent small business owners are struggling to come back from the shutdown of covid-19. All extra money should go to them to help them reopen and continue their livelihood.
- I just would like to see a paved trail from Fiddyment to Woodcreek.
- Please plant tree along the trail
- Need to insure power lines are not accessible to potential vandalism or personal harm.
- It would be awesome for there to be accessible BMX pump tracks for those people (like me) to go do jumps and have fun. You will be surprised of how many friends I have are wanting a track for their bikes to mess around on.
- No fencing on the trails please! Leave it as natural as possible.
- A nature preserve is something to be preserved not degraded with your proposed improvements.
- Mahany Park is filled with enough trails already. It's appeal is that it's not overrun with bicyclists. It's perfect area for walkers and their dogs. If anything, the trails need to be fixed over the creeks where the original foot paths have been washed out.
- This would be very nice, use this trail every week.
- Many people leave their dog poop bags in the trails. Many people let their dogs off the leash with kids and other dogs around.
- However, I would like to see the bridge over the creek that was removed several years ago re-installed.
- The more trails that allow for enjoyment of open spaces, the better.
- I would like to see the proposed sand volleyball courts completed near the tennis courts. What is the status?
- Please leave some of the open space wild.
- We have used the open space area at least since moving here 18 years ago. We would love to see an open space trail area. We are especially interested in the trail linking up with other bike trails in the area.
- My only concern is more people and trash.
- I think it’s a great project to connect bike trails around the city. Better connections crossing major streets help also for people trying to bike around the city and would encourage more biking.
- Love the bike trails in the city. Which they were fully connected more since riding on roads today (even within bike lanes) is more dangerous than ever with rampant cell phone use while driving.
- Since there is already a rudimentary trail system in the area, I think improving the trails by paving them would be a fantastic idea.
- Multiple paths would make it easier to social distance.
- I think it's wonderful that you are allowing residents to have an input on this project. Nature areas to walk are important to our mental health.
- I checked the trails out this morning on my bike. Less developed than I expected. I like bike trails, but it might be good to keep some trails undeveloped to keep the bikes off. Also, nice to have benches in shade. there was a wide bridge whose boards need some love.
- Yes, getting run out of the way by bikes speeding buy

- I would love to have more trails to ride in Roseville! I often take my bike down to Folsom because they have so many established trails there. I would love to have the same where I live. I live in Westpark.
- Help connect our city trails and set the foundation to make Roseville a city that you can walk and bike anywhere on safe trail systems
- We love it as is, please don't pave it.
- I really would hate to see things paved over. One of the reasons that I enjoy this area is because it is not paved. There is so much to see and I feel that paving it will completely ruin the experience and scare the wild life away because it would be messing with the natural habitat.
- Is there a gravel option with updated nature signs? Is there a plan to better monitor the area for inappropriate use? We see lights in the area at night. Also, someone was sleeping in a hammock tied to trees in the daytime. Some spray paint under overpass.
- Please continue to try to connect walking and biking trails so we don't have to be on the street
- This is great. A large t-shape through the middle connecting existing trails would be most cost effective.
- It's about time to do this.
- I would like to have a paved path that leads under the bridge near Rose Creek Road from Sun City to Mahany Park.
- I think it would be better to build a skatepark at Mahany Park rather than a trail.
- Wish they had finished the sand volleyball court in the park behind the aquatic center.
- I use this space often and enjoy bringing my children there for nature study. The less natural it is made, the less appealing it becomes. There is such beauty in the lazy dirt paths that wind through the Oaks. I fear that a paved path will bring many more commuters and possibly even transients to the area as has occurred in the downtown Roseville parks. I'm also concerned that with a Paved path there will be toilets added to the area which is thoroughly unnecessary as there is already restrooms near the library. Thanks for allowing us who use the space to share our input.
- It would be a great benefit to connect all trails together eventually. To be able to bike from one part of Roseville to all areas of Roseville similar to what Folsom has.
- Will our taxes go up to fund this?
- Please hook up to all trails leading to Folsom lake.
- Although I understand the need to protect habitat and vegetation, there is an appeal to walking a narrow path which at the moment is dirt. It is more like being in nature than on pavement. The one thing we appreciate about Roseville is all the open spaces to walk. Thanks so much for all you do to make that possible.
- Let's do it!
- Connect all Roseville bike trails.
- The most important part of the trail for us is to pave the part that is gravel so there is a complete paved way to ride to the high school, library, and park. Second, is safe creek crossings.
- People are already using the dirt and chip-and-seal access roads out here. There is a problem with user created bridges in several areas and adding something the city maintains would likely be an overall benefit to the area, as it would mostly confine the areas people use to better maintained trails and having trash cans and dog pots would at least greatly help with the amount of litter and dog droppings left by users of the open space area. Increased traffic would be an ecological detriment in that it increases human traffic in the preserve, but increased traffic would also hopefully increase responsibility of users as they have others around.

- Let's do it! Long overdue to have a bike trail extension west of the pool and school
- No dead ends. Follow existing dirt paths, no right angles. Bridge connections above or below arterial roadways.
- Nope
- I think it's a fabulous idea to have a paved path through the open space
- Have you thought about asking for donations from local organizations or businesses for some of the things needed, like benches or signage or dog waste stations? You might find some of the local organizations might get behind the cause financially to help out.
- Thank you for this project.
- More benches and swings for kids, any activity to bring people out
- This is the Cross Country team's only trail to run on for morning practice. The only thing I would add to the existing trails is more/updated wildlife signage and bridges to cross creeks, which have been a dangerous hazard in the past.
- I would love to see these trails remain dirt
- I think this is a great idea. I wish we could have more trash cans and dog waste stations around our city to help alleviate all of the garbage, waste, and litter that is throughout our residential sidewalks.
- We do need green space pedestrian/bike crossings through highway 65 near Pleasant Grove and near Blue Oaks or Stanford Ranch.
- Please complete this project as soon as possible! Definitely needed many years ago.
- What's the timing and funding sources for this proposal?
- Good idea
- Please keep some dirt trails.
- Paving the general maintenance road would greatly help, I hate riding my bike on it as it's way too bumpy and there is no other access to Woodcreek Oaks from the North/South existing bike trail.
- Please do not pave a trail. Please limit parking and access points. Please keep it as natural and protected as intended. Enforce dog walkers keep dogs on leash and pick up poop. I have seen dog owners turn dogs loose to chase migrating geese in the vernal ponds - awful! Paving will only encourage and increase all kinds of traffic in the park and surrounding areas. Please save your money and spend it on something else like energy rebates, supporting more police activities as the city is growing too fast and is losing the very amenities that used to make it a safe and special place to live.
- I thought the 1/2 percent city sales tax was to supplement the police and fire departments. I don't like seeing it spent on other projects. Our police force needs to be supplemented.
- In Roseville there are many greenbelt bike paths and maintained city parks. The Mahany nature preserve is unique in that it is mostly native valley plants and landscape as well as endangered vernal pools. While paving some of the main trails such as the access road running parallel to the powerlines running E-W and adding bridges for better access might be beneficial, the unpaved dirt trails I would say add to the experience people desire when they visit the Mahany nature center. If visitors want to walk on a paved bike trail there is one in Mahany and many throughout Roseville. While increasing trail signage, interpretive signage, and access would be positive, I would argue strongly against paving everything in order to keep the space somewhat wild.
- Thank you
- I love the idea.
- Please start ASAP

- Love the idea
- I would like to see the leash law enforced. I have been swarmed by dogs multiple times since COVID-19 started with many people out there with dogs off leash. The off leash dogs and owners who can't control them trample thru the plants.
- My family walks the dog several times per week in the Mahany Open Space. We have a Labrador Retriever that loves to play in the water. We have hundreds of friends in the area that walk their dogs off-leash too. These dogs need to run and handlers need Covid-19 safe outdoor activities. For the most part, dog handlers are responsible and self-regulate dogs with aggressive or runaway behavior. We don't need this area turned into a park with rules, parking issues and amateur ornithologists thinking it's a bird sanctuary.
- There are a few bad examples I would like to avoid, namely Veteran's park which is totally off limit to dogs also the trail West of Nichols Park the chain-link fence on the north side of this trail prohibits access to the creek. Pleasant Grove Creek Trail is nice but there are traffic issues with speeding bikers and joggers on the paved sections that are reluctant to slow down. Having leashed dogs makes these situations even harder to manage, like a giant bolas ensnaring everyone in a tangle.
- I am disabled and have limited mobility, a few foot bridges would be useful. There are three places that would be on my list; The North Bridge (38°46'00.42" N, 121°20'17.49" W) by the cardboard recycling bins near the Bear dog park (Point Q). Middle Bridge connecting the Main East and West trails (38°45'51.58" N, 121°20'30.69" W) or as an alternate a Woodland Bridge (38°45'58.70" N, 121°20'36.15" W) on the trail through the oak grove.
- If there were an unlimited budget, it would be nice to put in some tables on the two hill tops (38°45'48.84" N, 121°20'13.43" W) and (38°45'47.16" N, 121°20'11.85" W) and rip out the old benches. It's the best place to watch the sunset. And a garbage can, the kids leave a lot of broken glass up there.
- I was hoping you would pave the gravel maintenance road and replace the surfacing on the bridges.
- Please have all the trails connect.
- Exciting! Thank you!
- None. Thank you for the opportunity to comment
- If trail is going west of Fiddyment one day as shown, pave the existing access/maintenance road off of Fiddyment to park
- Has there been an Environmental Impact Statement conducted for adding paved trails to this open space?
- I would love to see a Par course type exercise stations that you could do as you walk run or bike along the way like they have at many colleges. The equipment is very low maintenance and not very expensive.
- Would love a trail, and to build some bridges! But would hope to keep it simple, so traffic doesn't increase. And also to stick to the current paths and not add new ones closer to homes.
- I use the trails of Mahany Park 5 times a week. I like it as it is, but definitely see the benefits of upgrading the trails. I hope you consider those "paths" that we have created through the woods south of proposed access point L and upgrade them.
- I think this project is a great idea!
- When I walk on some of the trails, they are not wide enough. Bikes come up behind me and dangerously try to go around, but there isn't enough room.
- Would love to see connection from veterans park to Mahany and to Miners Ravine
- Your posted map does not show the proposed trail - there is no highlighted green trail on the map aside from a small part off of Fiddyment road. You should re-publish the map to show what you are actually proposing.

- I would love exercise stations.
- We love the existing walking paths and use them a lot. It makes sense to add more and do it in a good way, the same as it has been done.
- Leave it as it is , a nice relaxed walking areas with no restrictions and a proper open space for everyone to enjoy.
- More police patrol on bike. Public safety.
- Adverse impacts to natural drainage and runoff are a concern; adverse impacts to wildlife
- It's nice that it feels simple and rustic. I appreciate having lands like this so close to Sun City.
- Please make the trail happen
- This is nice to think about but is this a wise use of funds during a depression? How much will taxes go up on the unemployed?
- This seems like a worthwhile project.
- Consider restrooms
- It is needed for safe scenic trail walking by the residents of Sun City; for long overdue removal of dead trees, etc.; for better brush fire control; for aesthetics; and for better insect control eg. mosquitoes.
- Can't our taxpayer money be used for a better purpose than this?
- If this project moves forward, I would suggest that the unpaved trails now being used be the ones that are paved & limit the NEW trails created to keep costs down since this project will not be used by a LARGE number of people. Keep the goats/sheep coming to keep the growth down & make sure LIGHTING is included to keep the people safe.
- It would be nice for the city to leave some places in the natural state that they are currently in. Adding garbage cans or dog waste bag stations are a plus. Otherwise that is all.
- Welcome all paved, off-road areas to walk and bike
- I would like to see the bike trails connect to existing trails and expanded so I can stay out of traffic.
- Leash laws should be posted. Nothing is worse than going on a run and approaching dogs without a leash, it's always scary.
- Please connect or make plans for a strong future connection to Sierra Vista community (e.g. pedestrian only light/ cross walk). The Sierra Vista specific plan calls for a commercial development and hopefully a access path through that future development. We need to get access to this wonderful project.
- I love this area!! I visit it weekly. I think it would be fantastic to have more trails that are user friendly to run, bike and walk on in Mahany Park!
- Paved pathways will reduce erosion, will probably encourage more people to use trails in rainy months, will encourage users to stay on trails and out of fragile land areas.
- Maybe add more "fun facts" signage or nature/map signage. Also if possible, maybe add some lighting along the proposed trails since it gets very dark once the sunsets and would help for safety. Also, add some bridges along creeks.
- Will the bridge crossing the creek located by the old water substation be maintained/ fixed, some of the wooden planks are rotting and getting loose (bridge is located in the area of "F" on the map above for Existing Access Points).
- A pedestrian overpass at Pleasant Grove and Woodcreek would be nice.
- Let’s definitely make this happen! We love Roseville!

- I think this is a great idea and as west Roseville continues to grow this will provide a much needed recreation destination for families.
- Wait until the City finances improve
- Has the project been approved to be built and the city is just looking for input or is the city debating whether to proceed with building the trail?
- Will you be taking public donations after the $300K?
- More bike trails allow for safer modes of transportation that are not shared with cars
- Plant some colorful trees, shade, water stations Please plant some nice small trees, planting in front of Fiddyment transformer station. The surrounding area by the station is an eyesore. The landscaping in front of the station has been severely neglected!!
- I go on these trails almost every day and I really enjoy them, I've lived here my whole life and the trails have lots of memories for me and the bike jumps that are there are really fun, and if it becomes paved, it will ruin the ability to enjoy the trails for me and my visitation of these trails will significantly decrease. Please do not pave these trails. It will seriously ruin the atmosphere and I will not enjoy a paved trail.
- Great idea! We walk the trail out to the small power shed and back to the library.
- How much would this cost? The map does not show where the trail would be located, would it connect with Fiddyment, Raley's, Library, Ball parks?
- Thanks for doing it. I'd love to see it ultimately connect to the Dry Creek Trail way
- I drive special to Mahany Park open space to run on the dirt trails. It hurts more to run on paved trails. All the trails around my house are paved and not enjoyable to run on. I also like to walk my dogs on dirt trails as temperatures rise it's hot on their paws to walk on paved trails versus dirt trails. Please keep this area natural.
- What plants and habitat are endangered in the area that would be improved by putting in a paved path? I think that paving paths throughout this area would be more of a threat to the "endangered habitat" than leaving it as is. Adding bridges over certain creeks and endangered areas would be more of a benefit than spending money on paving trails. I feel that people would continue to create dirt paths throughout the area, therefore negating any benefit that paved paths would create.
- I have lived in West Roseville for 17 years. I am proud of the fact that we have the Mahany Park nature preserve and it feels like you're taking a nature walk (ignoring the powerlines, of course.) I like the dirt paths.
- Mountain bike area or flat track
- How is this being paid for?
- Yes! It seems to me there are other needs that should take priority over paving a trail. Repair streets. I'd like to send you a bill for the roundup I use to kill the weeds on the streets in front of my house.
- Leave it like it is except lighting
- Please provide visible lines of sight around tight corners or steep slopes for bicyclist and pedestrians and provide money for maintenance for park staff to complete plant trimmings for over grown areas that impede visible lines of sight. Please put solar LED lights under bridges. Please provide 1'-2' wide compact granite shoulders on each side of the paved trail for walks and runners. Please plan and budget for maintenance for future slurry seals and maintenance on the asphalt trail.
- What are the environmental impacts?
- One of the reasons I like walking through the area is to get off of the asphalt and concrete that covers most of the rest of Roseville.

- I was very disappointed when the former plank bridges crossing the creek were removed. So having another bridge would be nice.
- I don't understand the contention that having a swath of asphalt through the area is less disruptive to nature than dirt paths (some of which were created by wildlife). I have been walking the area for over 20 years and have noticed different dirt paths come and go.
- You have too many names for the area, Mahany Park Preserve, Woodcreek West Preserve, Silverado Oaks Reserve, Woodcreek Nature Preserve. In fact, putting an improved multi-use trail through a "Preserve" seems kind of antithetical. I guess I am ambivalent about the project. From my perspective, there are things that would be nice about it, but I could easily do without it.
- I like it the way it is.
- Well overdue. Always wondered who owned the property and why it was so underdeveloped
- I repeat, less focus on open space and more on the needs of West Roseville residents.
- I actually like the dirt roads/trails, so see the bridges as the most important element.
- Leave it just the way it is. We love the natural feeling of the open space.
- The most important improvement is providing cross over of the creeks which would greatly improve connection with all the trails.
- Frequent user of pleasant grove creek trail. People do not know how to use the trail, unattended children, oblivious adults, right way to walk or bike, littering, dog poop, unleashed dogs & children, lastly mandatory trail safety course attendance.
- More paved trails = more people = more congestion, trash, and less nature = less wildlife = fewer reasons to have the open space area.
- Trails increase the desirability for family living and working in Roseville. Build and connect trails.
- I regularly use and enjoy this open space and have been picking up trash throughout the area for 9 years. Trash cans would be an excellent addition. Thank you for the thoughtful consideration of further improvement to this multi-use area
- It's such a beautiful peaceful walk right now you will change all that by changing the environment
- About time
- One of the best birding spots in Roseville. Plant more native trees and plants. Don't let the goats eat the willows. Protect the large oaks.
- I like the nature area the way it is, not looking forward to having more people in the area parking their cars in the neighborhood so access the trails. I live here and purchased the house because it had a wetland preserve so as to know that there would be no future infill projects.
- One of the top 10 Birding Hotspots in Placer County
- Great idea!
- This would be great. Would love to walk and ride my bike through the park.
- I love this trail. I run and walk my dog on it every day. I am 36 years old and have been using this trail since I was 14 years old in Cross Country at Woodcreek. It is invaluable to my perception of why I KNOW Roseville is the best city in Placer County. I love how clean the streets/trails are and look forward to putting our tax dollars towards something that will increase our quality of life.
- Excited for more trails!
- I frequently have to avoid walking through the park because it is common for people to unleash their dogs.

- I relocated to Roseville one year ago and didn't know there was an Open Space at Mahany Park. I'm eager to see trails added so that I can use that space. I'd rather walk on a paved trail than through any area where I could disrupt vegetation or animals.
- Excited
- If you want to preserve the area, I do not see making improvements which will drastically increase traffic being a good move.
- Keep the area dark, it's great to have a place to go see the stars from.
- Adding a trail through the area is a much needed improvement. Crossing the creek W. of the dog park would be a nice addition to the area. Providing a trail through or near the old Oaks might discourage some abuse of that area. I've seen 400 year old oaks fall to the ground, it is heart breaking. It would be nice to see the old trees in this area continue outlive the residents.
- Would it be possible to fence off some of the vernal pools to protect them from people and unleashed dogs? Would it be possible to add more oak plantings in with this effort for some of the areas out there?
- As a side, I've lived in Roseville for over 20 years and ran that informal trail the entire time. It used to be one path but over time has spiders out into several. It's a beautiful piece of nature in the city that I'd love to have responsible city management of for both environmental and public benefit.
- I would love more trails, but wonder if the city should be budgeting a project like this right now in a time of such economic uncertainty.
- Please at least put asphalt on existing gravel maintenance "red" path
- The space is so beautiful and tranquil. It offers local residents the opportunity to enjoy the outdoors close to home. Sometimes paved trails can bring a lot of traffic to nearby neighborhood homes that would be unwelcome and unfair to the homeowners who bought specifically for a quiet neighborhood near a green space.
- I would like to see it remain as it is
- I think paving the wide, gravel part is a good idea. It provides better and easier access to some people and is more bike friendly. But what we currently have is a nice way to connect with nature in the middle of the suburbs, and I don't think we should undo that
- I continue to encourage the City of Roseville and Placer County to develop and interconnect their multi-use trails.
- The elementary school nature walk field trip with High School student presenters was peaceful and enjoyable. Hopefully a new multi-use trail will not negatively impact the natural beauty of the space and the wildlife and their habitat. All existing Mahany Park areas and nearby public facilities are unique and wonderful.
- I would support small wood bridges being added to make the many creeks easier to cross when they have water in them.
- Mostly I would love to see the power lines go away and be sunk underground. They are ugly and I worry about being around them in terms of my health. On the other hand, I am pretty sure the only reason this space is not developed is because the power lines are there. Let's be honest, there is not much public open space actually set aside. "
- Nice to see more rec options for residents
- I have lived near this open space for 13 years and have longed for a paved trail in this area both for exercise and for my kids to walk/bike to school on! However, what I don't understand when looking at this map is why the trail can't just go through the

middle of the open space like the dirt trails already do?! They are nice trails that could be made even better by paving them and building a bridge over the creek! I walk the Veterans Park trail quite frequently and I know that there have been bridges and additional trails added there within the last 5 years or so. When looking at the proposed trails on the other side of Fiddyment it does look like that trail would run through where to electrical towers are, not around.

- Also the gravel maintenance road is horrible to bike or walk on, is this going to be paved as well?
- And lastly, I don't like the idea of having to walk out on Fiddyment or Pleasant Grove at all. Those are very busy streets and if you're trying to enjoy a nice walk having to walk with cars zooming by you is not very relaxing!
- Public water fountain and restroom station. Entrance F is currently not so friendly to strollers or bikes.
- I would not want any paved trail over existing bridges or creeks. Please keep it as natural as possible by not paving in the interior of the park. If paving, please limit to outer perimeter only.
- Keep it accessible and fun for trail riding mountain bikers.
- It's a great idea. As much as possible, connect with other trails.
- I see the damage due to trespass as a failure by the city to protect the open space habitat in the first place. The open space was protected as mitigation for previous urban development and the city has a (legally binding) stewardship obligation that cannot be set aside. The excuse that you must "pave it to save it" does not hold up. There should be an analysis of the stewardship obligation of the city, which is not even mentioned.
- I wish there were a better way to link the trails, so you could use them to get places without using the street as much
- Connect East to west Roseville
- Wish it would remain untouched. There are enough paved areas if people want to go on them I have seen many people enjoying the paths walking running and biking especially during the quarantine. Don't need bathrooms or fitness stations or trash cans out there
- Please build the Linda Creek trail first.
- I'm a bike rider who doesn't like riding on the streets as some drivers are careless in driving habits and wander into bike lanes.
- I've loved this place since I've lived in Roseville (12 years). It's been a huge part of my childhood and growing up, and I hope it can be a source of natural beauty for many years.
- The pump station at the end of the gravel road looks awful and run down, is it even used? It needs to be fixed up and maybe have some plants around it. For a city that takes great care of its infrastructure it's a sad sight and has been for many years.
- I would like the city to protect the large oaks from the goats which it employs for fire protection. Over the last few years I have seen the goats doing damage to the trees by foraging on the lower branches. I have an plant and tree science background. This damages the beautiful heritage oaks. The lower branches sometimes do not recover from the stripping of foliage and bark.
- I live a block away and walk there most evenings in the spring through fall. I am concerned about the wildlife being disturbed. Please keep this in mind as you plan additional use of this space
- I am concerned that trails will become too busy
- I love the space.
- Great ride location. Keep up your good work for the residents of Roseville. Thanks for the survey.

- If this project goes underway, please make sure that it doesn't affect the environment at all!!!
- Love the idea
- I don't believe this is a necessary project. The beauty of this area is it's "natural" feel. There are enough designated paths already.
- If possible, a gravel/smooth dirt trail would be a nice addition to Roseville's trail system.
- Keep doing a great job. You can't please everyone, but be fiscally conservative and spend your residents tax money wisely. Keep focus on community and the people that pay for a great Roseville.
- More details on other bike trails this project will connect with.
- None
- A paved trail that links the dog park, Junction, and the Roseville Aquatics Complex is 20 years overdue. Nonmotorized access is not possible without using a high-speed arterial or collector.
- Well-designed survey. Thank you.
- I think this is way overdue excited Roseville is creating paved trails I would like the trail to be connected to Suncity so people don't have to cross or access the roads to be able to go to the other side.
- Connect all bike trails throughout all Roseville
- Construct bike park with jumps.
- I love walking the local trails and would like to see it linked with others for additional trail options.
- Our trails are fantastic. I would love to have all trails connect without the need to go onto roads/sidewalks. For example, the trail that goes past Barbara Chilton and then extends west and curves north could connect to the trail that goes through the pistachio trees / orchards on the trail that is north of Blue Oaks Blvd. This would be fairly easy to do, and this would allow people to connect many more of the trails together for fitness and recreation. Thanks for all of the work on our trails and parks!
- I do have a question about the land that is at the corner of Fiddyment and Blue Oaks. We have been waiting for a long time for trails on that land. When will the promised ""nature trails"" be established there? Thanks for any information that you can provide (jmwhitman92@gmail.com).
- Thanks for building trails to prevent erosion and damage to plants.
- This has been needed for a very long time!
- More small trees on the Western portion for shade would benefit, or a public fruit tree picking area e.g. lemons, figs, olives.
- Would very much appreciate having this additional paved trail
- This would be a lovely place for an evening walk.
- I think this is a great idea. My family and I already utilize the space for bike riding and are interested in doing so for many more years to come.
- From the maps provided I don't see much proposed improvement within the red-outlined area - just a small additional trail outside the red lines.
- Keep up the "open minded" approach to alternative modes of transportation for an area growing too fast
- Would be great to have safe bridges to cross the creek at all the access points.
- Shaded areas with benches.
- Hope you create the trails such that the preserve can be protected and admired.
- Pavement is hot in summer months and can burn the feet of dogs. Leave it alone. Complete waste of money.

- Thanks so much for taking input. This would be a great addition to our already wonderful city trails and parks.
- I would love to see a paved trail in the open spaces. I enjoy walking , especially in nature areas.
- Is there a way to keep motorized or semi-motorized (electric bike/scooters) off the trails? I've seen OHV using trails on the west end of town.
- We have learned from the COVID 19 quarantine just how vital these outdoor opportunities are for citizens of all ages. I want to thank the City for having the foresight to construct such beautiful parks and set aside open space. I served on the Parks and Rec Commission back in the 90s. I believe that Ed Mahany would be so happy to see today's residents enjoying this land while preserving its beauty.
- Yes please make it only for dogs on a leash.
- I'd rather it stay unpaved. It's a great place where people can still go ride dirt bikes and mountain bikes, explore the marshes, and walk along well-worn footpaths. It's nice to still have a chunk of Roseville in its natural state to explore.
- Better use of money that you usually waste!
- I think this is great, especially if it’s connected to other paths. I don’t like riding my bike on the street & desperately are looking for longer, safer places to ride. Thank you!
- I come to Roseville with my kids and push my Grandma who lives in Del Webb on the paved trails and my kids ride their scooters. More paving would be nice and we would be able to go farther.
- The open space is relatively flat and serves well as-is, unpaved. I believe that paving a trail through would reduce the charm and character of the open space and increase traffic and refuse through the area.
- I think a multi-use trail is a welcome addition to the space, since it can provide a nice area away from streets and cars to enjoy a walk/run/bike.
- Good ide
- Do not pave
- Again, please plant more trees and have it connect into existing bike trail
- How will it connect to existing trails and what trails will it connect too?
- Thus is a place where people can walk outside and feel a connection with natural beauty. Not every park requires all kinds of amenities. There are ample bike lanes and sidewalks, as well as developed parks. Leave the open space as is, people want and need more undeveloped areas in Roseville or it will soon feel like San Jose.
- There is little information and general knowledge of this trail system and all trail systems in Roseville. We have been here 6 years, we are walkers, and yet we never knew there was a Mahaney trail. No maps, no signage, no marketing of such city trails.
- The more trails in Roseville the better
- I would like to see these paths better connected to each other. Right now it seem like it's .5 miles here and .5 miles there. It would be nice to have a 5 to 10 mi. loop.
- Please work with WLL Board.
- What bucket of funds does this come out of? I am concerned that there are other more pressing needs with limited dollars. How is it being prioritized? Not sure this is priority.
- Living in the Westpark area, my family and I would love to see a trail through this area as well as a connector and trails in the open discernment directly to the west of Fiddyment (under the power lines). We live to bike and walk and for safety prefer trails over roads. It would be nice to be able to bike to get

groceries at Raley's and visit shops/eateries nearby.

- Pavement is bad for walkers/joggers joints. Also, the paving material is full of chemicals that bleed into the surrounding areas.
- I think making it a large loop with a few different inlets from streets/neighborhoods would be the best. Roseville needs another trail, a large circle like Maidu Park. Please!
- Looks like a good project! Emphasis should be on connections between existing and proposed trails so as to create a transportation system.
- The open space is so beautiful and feels like a walk in the country. I think the impact on wildlife from bringing in noisy equipment and smelly asphalt would not be good. A lot of people stay off the trails in the wet season which gives wild life a break from people.
- Leave it natural, not everything needs to be paved.
- I love that trails will connect to the larger network. Please consider adding lighting in some areas. Perhaps solar powered?
- Will there be a paved trail down the middle of the open space down to Fiddyment? It is not shown as proposed on the map.
- Please don't pave. We have enough paved trails. We need the nature
- Just build bridges across creeks on current dirt/gravel trails and done. Don't need anything more.
- Some dirt trails built in would be awesome too
- Please provide access across the creek from point M on pleasant grove to existing trail coming north
- Would be great to incorporate more features for mountain bikers. Maybe a bike park.
- These improvements would be received well by the community.
- Make it happen
- A paved path to the dog park would be amazing. A paved or gravel path from the aquatic center to Fiddyment would be great for exercise.
- Keep dirt trails parallel to paved trails. Don't just pave over them.
- This multi-use trail is a wonderful idea. Thank you very much.
- Please connect all trails. Drivers do not respect bikers. There are a few trials in West Roseville that should be connected.
- Any ponds or Creek areas for nature.
- When will it connect West of Fiddyment & South of Pleasant Grove?
- I would love to see all our trails connected; makes for great adventures with family and friends when we walk, run or ride our bikes.
- Dirt paths are still good. Don't pave everything.
- It would be great to be able to ride from here and connect up with Washington to Royer and jump on the trail to Folsom.
- Water fountain at either ends and in the middle.
- Wonderful
- A parking area at the end of the trail (access point L) would be nice.
- Since we all get taxed a huge percentage of each sale for the wetlands, how fast can you get this done?
- Please make bridges over the little rivers , we would like to bike
- Great idea! Lots of teenagers take it to and home from school. Maybe some safety features. Worry about homeless in the field.

- The more ways we have to get out and appreciate nature, the better
- I think it sounds like a great idea.
- I do currently enjoy the dirt fire road path out there more than I enjoy paved trail and visit because of the option to run on dirt
- It would be great for the city
- I would love for this path to be paved and for multiple points to enter the path. I see it as a great form of exercise, and to enjoy nature. I would really utilize the open space preserve more if there was paved access. Right now I worry about uneven ground and tripping and falling where there isn't a bridge across the creeks.
- We also need shops and gas station
- I would like it left the way it is. I like hiking on the dirt tails. People will still make their own trials even with the paved trails. I am against the pave project.
- This is a great idea
- It was make it easier for the kids to ride bikes on. Thank you!
- Install a Par course
- It would be amazing
- Please build this!
- Please Do it
- I love Roseville open space projects and I think it's great during the events of recent times to encourage more people to spend time outside since we know in this format it's less risk than other indoor leisure activities.
- Thank you for helping improve trail connectivity.
- I like paved trails for biking
- Looking for a continuation of the bike trail
- Can't wait for the improvements
- Paved trails are great, but dirt single track trails are also a lot of fun for the whole family. You truly feel removed from the city and in nature when you are on a dirt trail. Roseville should start a program to develop and maintain single track throughout the city. This would be much cheaper than spending millions of tax payer dollars on paved trails. Again I love both, but think we need more single track in the city.
- I love the trails. Big proponent of having trails be able to connect together!
- Would like to see the area planted with blue oaks.
- I think the footpaths would be reduced just by putting in bridges, especially in trees near Pleasant Grove where people trample the bank trying to find way across stream that has steep banks
- Access points from Pleasant Grove Blvd. are the most needed.
- Pave the trail along the power lines, the rocks aren’t nice to bikes, man or beasts
- Finish the trail across the creek to Pleasant Grove next to the dog park
- I currently use the Open Space and feel bad about using all the dirt "paths."
- I think it’s a great idea. Trees or fruit trees will be great. As well as water station or water for drinking. Miles marker will be great too.
- Would love to see the gravel path paved to connect to other paved pathways.
- Possible restroom and or water fountain

- I lived near current access Point P and used the area frequently, all seasons. Tremendous asset. Now live in East Roseville, still drive over to walk my dog in the old stomping grounds he traveled as a pup 12 years ago.
- Please add pavement markings for those who cannot read to walk left, ride right. I think if you painted this info head to head showing the direction if going one way and again a few feet farther along to show if walking in the opposite direction it might help the obvious confusion. People and often foreign language users do not read the green sign at all.
- I moved here last year and didn't know there was an open space and will access it now that I know it's there when I go to the library.
- Leashed Dog Signs thru out
- A timeline for how long the process is would be nice to have.
- Excited to see it happen.
- We must consider a safe way to cross Fiddyment for residents in West Park and Sierra Vista to safely access this Mahany Park Open Space Trail from the west.
- I would prefer to keep it as-is and more natural rather than more paved trails
- I don't currently use the trail space but if it were connected to other trails I do use, I would begin to use it
- Do it. I've been waiting for this to be completed for years.
- Connect existing bike trails and build creek bridges, but leave the rest alone
- I moved too Roseville because off the walking/bike paths. The more the better
- What a wonderful idea! It would be nice to connect with the existing trail along the power transmission line on the other side of Woodcreek Oaks Blvd.
- I have always wanted to walk back there but have been hesitant because of the uneven surfaces. I would love to have more paved walking trails in the area.
- Building more trails - and linking them together - is a win, win for everyone
- I live in Olympus Point so my use would be minimal at best. However, it seems like a good idea for the City and will help protect those habitats.
- We really need paved trails that start in point E and ends at the Roseville Commuter Stop (park and ride). Currently is hard to bike to the Commuter Stop. I live close to point E
- Trail etiquette pamphlets or signage at trail heads would be amazing - The amount of people "doing their own thing" is unsafe
- Keep the dirt trails
- will you openly allow input? Too many people and too many improvements all in the name of progress. Ruining the only remaining preserve we have by laying concrete. Most people do not respect wildlife, natural areas, or common sense to clean up after their dogs. The police will not even come out when dirt bikes, quad runners and golf carts are reported as they rip through trails. The few animals and wildlife that still exist will be pushed out.
- Leave it the way it is
- Consider moving Fiddyment Road access points (on both east and west side of the road) a little bit north, closer to Pleasant Grove Blvd, to encourage using the signaled intersection instead of jaywalking across the road.
- Would like to see shade structures at points along the trail. It often gets very hot walking with little ones within minimal cover.

- Connect it to Maidu.
- This would be great. Even if it is a simple trail that extends the length of the open space and connects to the existing trail. It doesn't not need to be super extensive and cross crossing all over.
- It would be wonderful to create this trail and especially connect it with other paved trails in the area. I am always looking for safe places to exercise away from the dangerous conditions that exist on Roseville's public streets. Drivers are paying less and less attention, which increases the risks to those riding their bikes, running, and walking along our streets. I hope the City of Roseville agrees to go forward with this plan.
- It's beautiful. Keep it clean
- I would love to see all the pathways eventually connect. I'd love to be able to ride my bike from the path head at Woodcreek near the overflow lot to the restaurants on pleasant grove and somehow see it connect to the path off Diamond Oaks that takes you to the Fountains and mall.
- Much overdue
- I would like Roseville to have a vast network of bike trails similar to Folsom.
- Maye a couple drinking fountains for children and dogs
- I would love to see more trails in this area because there are limited places to explore on a bike due to the limited paved trails in this area. The nature is beautiful in this area but hard to explore and appreciate due to the limited paved trails. I think connecting different parks and neighborhoods with trails helps limit the need to drive to these areas, and helps promote biking and walking to different parks and neighborhoods. This will promote cleaner air and more community interaction.
- Area needs more trees.
- I'm a runner and would love to have more paved trails around to keep me off sidewalks and near traffic. It's also safer to bring my kids along when traffic isn't a concern.
- I really like to see the paved multi-use trails. I would like to see more continuity between the trails. I think there are plans to connect trails but I don't know how long that will take.
- It is time to do this because of the population boom
- Great project, just do it
- This is really a great opportunity to dramatically improve both N-S and E-W connectivity in North Roseville, especially by making direct connections between surrounding neighborhoods and both Mahany Park and Woodcreek HS. This also provides an opportunity to maximize the value of the existing undercrossing of Pleasant Grove Blvd. I also think interpretation of the natural area is important to foster a sense of stewardship for the preserve, which will ultimately help it thrive as its primary purpose, a preserve.
- Yes, I support this project
- Trails are important, my first priority is another trail over or under Interstate 80 in the Cirby Street area.
- A paved path would be beneficial to students attending Woodcreek HS. It also would be nice to have more bike trails in this area.
- I think it would be a very nice addition to existing trail complex that make Roseville such an great place to live
- Create more dirt trails too
- I'm so excited to hear this could be in the works.
- I really think this trail could be incredible for the community. I think it would serve the community better than apartment complexes or another shopping center. I also believe this would be important in helping

with the preservation of a lot of wildlife in the area.
- Most important to replace the bridges that the city removed a few years ago making Mahany Park almost unusable
- It gets too crowded now
- How fast can you make it happen?
- Bathroom. Bridge over creek. Water fountain.
- I've always wondered what killed the numerous dead oak trees along the waterway. If you're adding informational signage, the information would be interesting to know.
- Where will the Woodcreek HS MTB team practice if they lose their trail? Please consider that natural surface trails can be sustainable with proper design and maintenance, and are much more enjoyable. A parallel natural trail may be a solution.
- I love this area and I walk through it 3-5 times a week. I would love to see some improvements without hurting the current feel of it. It's very soothing and relaxing to walk through .
- There are no connections to the "Saint" Streets from the trail and we have to walk through the plants if we need a quick way home. We'd love a dirt path connection to some of these streets. Also, the post and cable fencing at these streets do not have any openings to get bikes through. We have two young kids (one we're pulling in a bike trailer) and we're unable to get through this way. The same issue occurs near Junction as well as Aylesbury.
- It would be wonderful to have a connecting bike trail through the western part of the city. Away from "freeway" conditions on major thoroughfares.
- Great idea
- This is the right direction for the city and citizens
- Roseville should have a network of multiuse trails that connect west and east, such that people could bike across town in safety.
- I like how it is. No bikes speeding by. Perfect as it is
- Put gravel trails in, don't pave it. Bridges to cross creeks so it doesn't erode the land
- My concern is about destruction of the habitats
- Not sure it’s worth the tax dollars to do this especially given our poor economy right now
- Don't have this valuable resource

Public Comments from Social Media

- After living here 21 years, Roseville has horrendously mismanaged this area. First the inadequate slope for drainage under Pleasant Grove Blvd created back up, raising the water table. Addition of housing irrigation runoff in the summer added to this problem. Dozens of 100 - 200 year old blue oaks have died in the last 20 years due to too much water. Second besides the vernal pools, much of the understory vegetation is invasive plants typical of the long term grazing impacts from California. Lately concern over fire danger has led the city to use goats to graze vegetation down to the ground. These goats are moved all around the sacramento region, and therefore spread weed seeds in their fur and feces. I suggest you develop an adequate habitat management and restoration plan on top of the concept of just paving the walkways.
- I would prefer you left it just the way it is. A little untarnished dose of nature. Helps keep me sane. I agree with the other folks on here already: manage this natural resource properly, but spend our tax dollars on

the important things first. Laying more pavement is unneeded.
- Could you clean up the homeless camps by Olympus Pointe Sculpture Park?
- Not too paving. Too much of our city is now a concrete jungle. Sand and gravel a path if you must.
- Like others said, just leave it the way it is. If anything plant more trees there.
- How about people use the existing spaces that we've been taxed for.
- The more trails, the merrier. Also, a great addition to our existing parks that have a vast area not being used, would be pump tracks. A concrete course with jumps and turns for bikes.
- My morning walk
- It would be nice to see a paved sidewalk on Pleasant Grove near the fountains so people didn't have to walk or bike in dirt. The sidewalk just stops till the light.
- Just pave it, they will come.
- Yes, connect and make trails!
- Look forward to learning more.
- Build a new bike park like Auburn did, along with a new skate park.
- The balance of trails and open spaces is one of Roseville's greatest treasures.
- Personally I'd like to see the city invest some money into fixing the death trap that is Maidu Skate Park before you start paving over more open space preserves.
- I would prefer that it remain as much of a nature preserve as possible, permeable pathways, least amount of development
- This would be awesome! Looking forward to a trail from far west Roseville to fountains.
- Great idea on the trail, but don't pave it
- Sounds inviting for many reasons. Trails for running, walking, biking etc. and watching nature and it's beauty
- Excellent idea. Always nice to be close to nature. Definitely pave it so everyone has a chance to safely walk/ride the trail.
- What about a off road mountain bike trail with some rough terrain?
- Yes, keep people on the paved path, let nature have the rest.
- Can Roseville please get a legitimate Skate/BMX Park. Love how two monster projects are going on at both Crabb and Central Park and neither are getting a concrete park. Please let me know how I can actually help make this a reality
- I feel like the public is very respectful of using the trails that have been worn away and that there is not an over abundance of them.
- My kids really enjoy the dirt trails. Since Roseville doesn't have a bike park, dirt trails in the open space are the next best thing.
- I love Roseville and all the wonderful trails dirt or paved.
- It's nice to live in Roseville. We have lots of nice trails.
- Take that money and put into our schools.
- It is hard to think about a walking path, during a pandemic, with our children suffering, and more money being taken away from their future.
- Although there are several joint use agreements between parks and the schools around town too may be worth mentioning.

- Open up the batting cages at Mahany & Maidu
- Put in a disc golf course.
- Yes, we need more walking trails and as long as it doesn't interfere with wildlife. And it sounds like this will actually help.
- Dirt trails are way more fun and it is a great contact with nature. I believe dirt trails absorb less heat than paved trails, making happier hikers.
- Make more golf cart trail for west park.
- Put some bike trails and/or a park. You spend enough time and effort tearing down the jumps built by kids, put in a park so they don’t have to tear up non-designated property. There are already plenty of paved trails for walkers and casual riders.
- We really like the fact that it is dirt. We go for bike rides or nature walks. My kids never want to be on the paved portion because it’s boring. They love being on the dirt. Keeping it dirt makes you feel like you’ve left the city and gone into nature. I hope you reconsider.

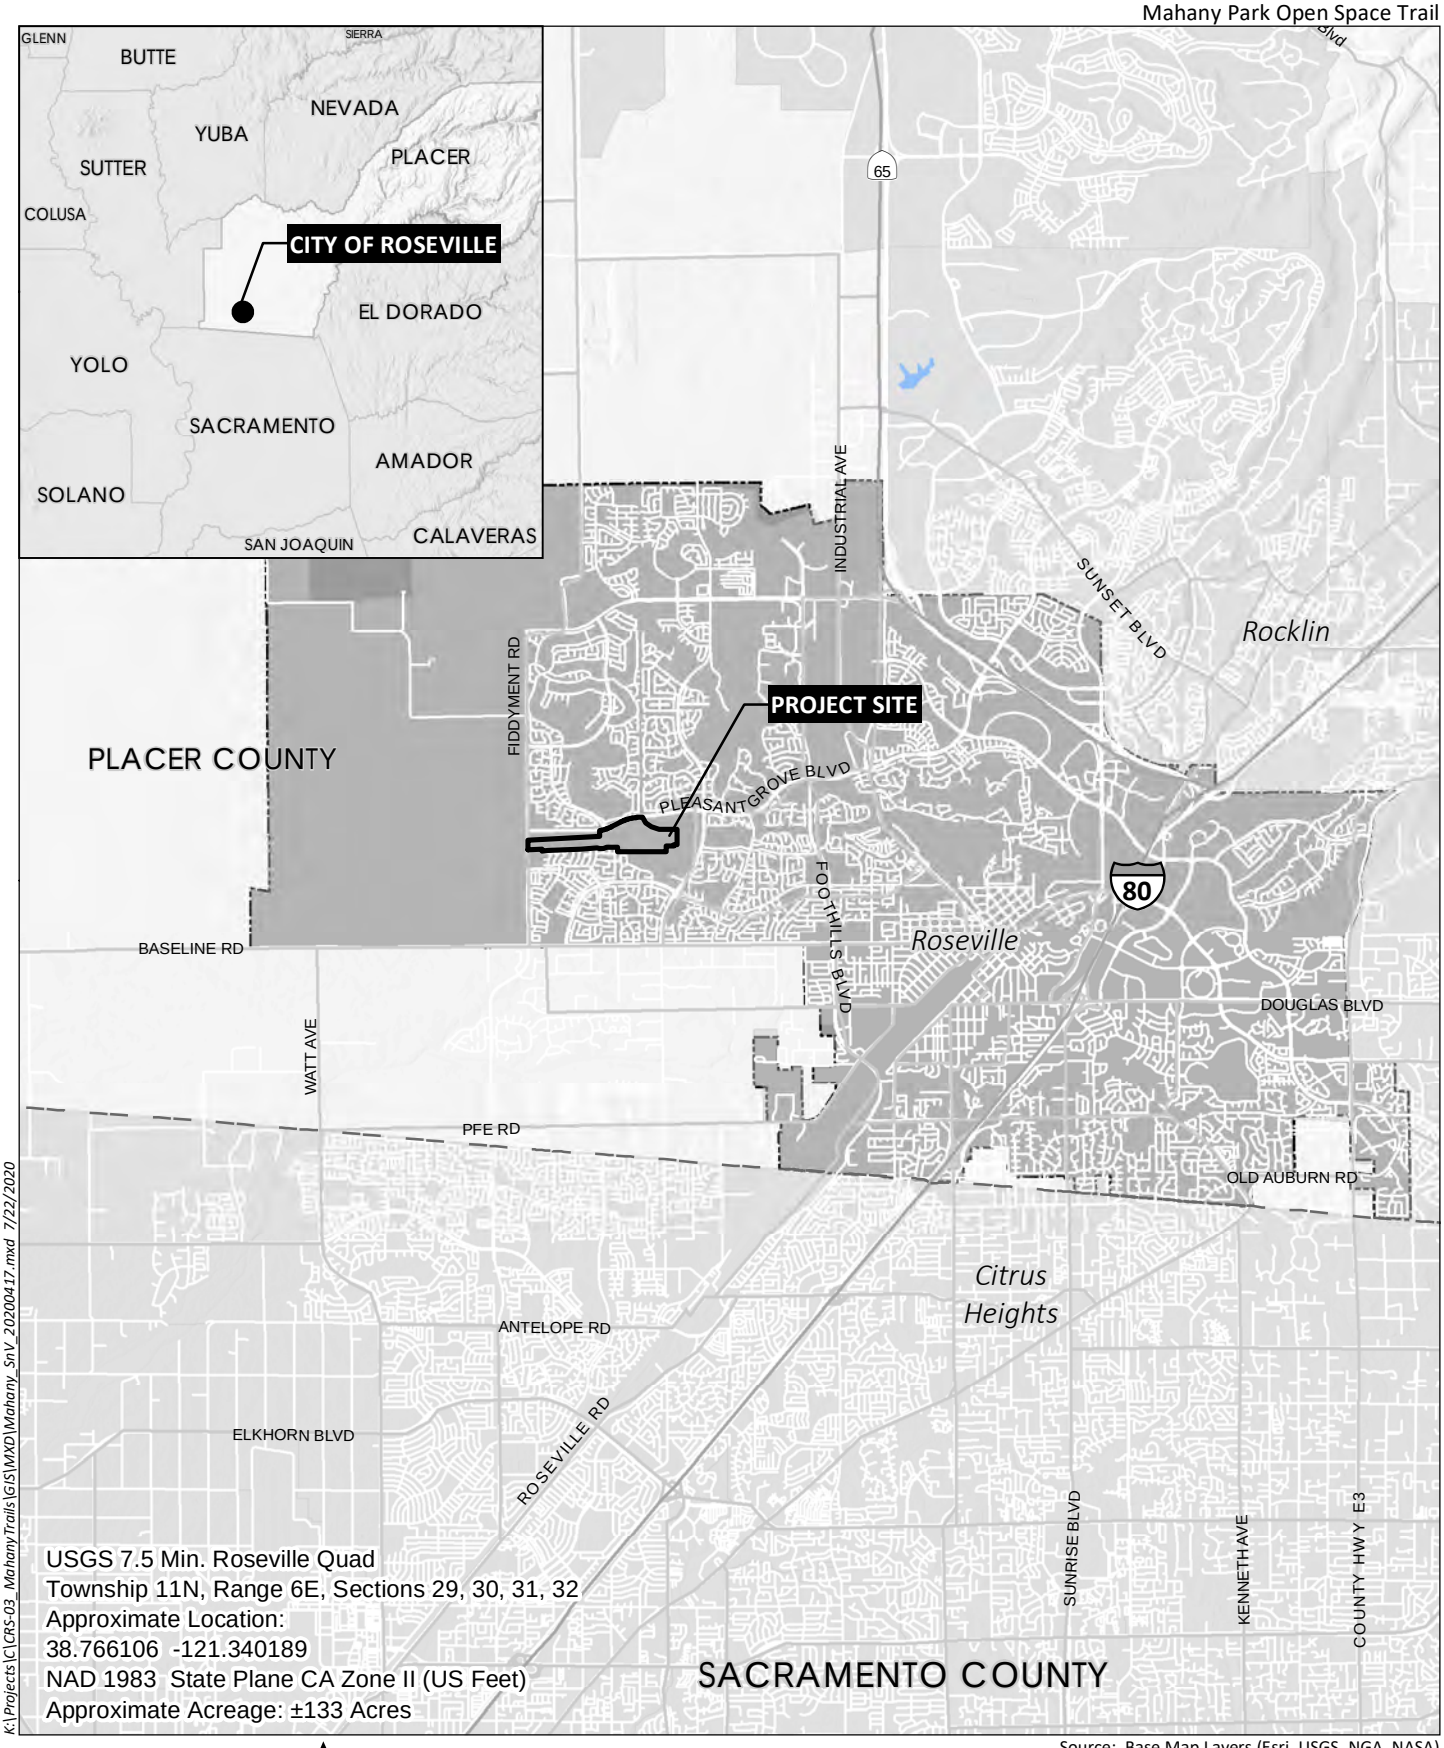
1.0 INTRODUCTION

The purpose of this Biological Constraints report is to assess the general biological resources on the Mahany Park Open Space site (Study Area), to assess its suitability to support special-status species and sensitive vegetation communities or habitats, and to provide recommendations for any regulatory permitting or further analysis that may be required prior to development activities. HELIX Environmental Planning, Inc. (HELIX) conducted biological and arborist surveys of the Study Area in February 2020.

2.0 PROJECT SITE

2.1 PROJECT LOCATION



The ±133-acre acre Study Area is located in the western half of the City of Roseville, California. It is within Township 11N, Range 6E, Sections 29, 30, 31, and 32 of the United States Geological Survey (USGS) 7.5-minute series *Roseville* quadrangle and its approximate location is -121.340189 West and 38.766106 North. Parks, schools, businesses, and multi-family and single-family residences surround the Study Area. Pleasant Grove Boulevard, Mahany Regional Park, and Bear Dog Park are located to the north of the Study Area. Bottlebrush Circle, Woodcreek High School, and Silverado Oaks Urban Preserve are located to the south of the Study Area. Fiddyment Road is located to the west of the Study Area. A CVS drugstore is to the northwest of the Study Area and to the east of the Study Area is Woodcreek Oaks Boulevard (Figure 1).

2.2 TOPOGRAPHY AND WATERSHED

The general topography of the Study Area consists of rolling and moderately sloped areas, with elevations that range from approximately 116 to 137 feet (35 to 41 meters) above mean sea level (MSL).

The Study Area is in the Pleasant Grove Creek Watershed Hydrologic Unit Code (HUC) 12-180201610302 and the Curry Creek Watershed HUC 12-180201610401. Both creeks empty into the Pleasant Grove Creek Canal which drains to the Sacramento River via the Cross Canal. The majority of the Study Area is located within the Pleasant Grove Creek Watershed. The hydrologic regime within the Study Area is predominantly seasonal stormwater runoff and direct precipitation, which primarily falls between November and March. Kaseberg Creek, a major drainage of the Pleasant Grove watershed meanderers through the eastern portion of the Study Area.

3.0 REGULATORY BACKGROUND

3.1 JURISDICTIONAL WATERS

3.1.1 Federal Jurisdiction

Any person, firm, or agency planning to alter or work in Waters of the U.S. (WOTUS), including the discharge of dredged or fill material, must first obtain authorization from the U.S. Army Corps of Engineers (USACE) under Section 404 of the Clean Water Act (CWA; 33 United States Code [USC] 1344). Waters of the U.S. are defined as:

(1) All waters which are currently used, were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide;

(2) All interstate waters, including interstate wetlands;

(3) The territorial seas;

(4) All impoundments of waters otherwise identified as waters of the United States under this section;

(5) All tributaries, as defined in paragraph (c)(3) of this section, of waters identified in paragraphs (a)(1) through (3) of this section;

(6) All waters adjacent to a water identified in paragraphs (a)(1) through (5) of this section, including wetlands, ponds, lakes, oxbows, impoundments, and similar waters;

(7) All waters in paragraphs (a)(7)(i) through (v) of this section where they are determined, on a case-specific basis, to have a significant nexus to a water identified in paragraphs (a)(1) through (3) of this section. The waters identified in each of paragraphs (a)(7)(i) through (v) of this section are similarly situated and shall be combined, for purposes of a significant nexus analysis, in the watershed that drains to the nearest water identified in paragraphs (a)(1) through (3) of this section. Waters identified in this paragraph shall not be combined with waters identified in paragraph (a)(6) of this section when performing a significant nexus analysis. If waters identified in this paragraph are also an adjacent water under paragraph (a)(6), they are an adjacent water and no case-specific significant nexus analysis is required.

(i) ***Prairie potholes.*** Prairie potholes are a complex of glacially formed wetlands, usually occurring in depressions that lack permanent natural outlets, located in the upper Midwest.

(ii) ***Carolina bays and Delmarva bays.*** Carolina bays and Delmarva bays are ponded, depressional wetlands that occur along the Atlantic coastal plain.

(iii) ***Pocosins.*** Pocosins are evergreen shrub and tree dominated wetlands found predominantly along the Central Atlantic coastal plain.

(iv) ***Western vernal pools.*** Western vernal pools are seasonal wetlands located in parts of California and associated with topographic depression, soils with poor drainage, mild, wet winters and hot, dry summers.

(v) ***Texas coastal prairie wetlands.*** Texas coastal prairie wetlands are freshwater wetlands that occur as a mosaic of depressions, ridges, intermound flats, and mima mound wetlands located along the Texas Gulf Coast.

(8) All waters located within the 100-year floodplain of a water identified in paragraphs (a)(1) through (3) of this section and all waters located within 4,000 feet of the high tide line or ordinary high water mark of a water identified in paragraphs (a)(1) through (5) of this section where they are determined on a case-specific basis to have a significant nexus to a water identified in paragraphs (a)(1) through (3) of this section. For waters determined to have a significant nexus, the entire water is a water of the United States if a portion is located within the 100-year floodplain of a water identified in paragraphs (a)(1) through (3) of this section or within 4,000 feet of the high tide line or ordinary high water mark. Waters identified in this paragraph shall not be combined with waters identified in paragraph (a)(6) of this section when performing a significant nexus analysis. If waters identified in this paragraph are also an adjacent water under paragraph (a)(6), they are an adjacent water and no case-specific significant nexus analysis is required.

Within non-tidal waters that meet the definition given above, and in the absence of adjacent wetlands, the indicator used by the USACE to determine the lateral extent of its jurisdiction is the ordinary high water mark (OHWM), which is defined as that line on the shore established by the fluctuations of water and indicated by physical characteristics such as a clear, natural line impressed on the bank, shelving, changes in the character of soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas.

Wetlands are defined under the CFR Part 328.3 as those areas that are inundated or saturated by surface or ground water at a frequency and duration to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions.

The USACE has determined that not all features which meet the WOTUS definition are, in fact, considered WOTUS. Normally, features not considered WOTUS include:

(1) Waste treatment systems, including treatment ponds or lagoons designed to meet the requirements of the CWA.

(2) Prior converted cropland. Notwithstanding the determination of an area's status as prior converted cropland by any other Federal agency, for the purposes of the CWA, the final authority regarding CWA jurisdiction remains with the U.S. Environmental Protection Agency (EPA).

(3) The following ditches:

(i) Ditches with ephemeral flow that are not a relocated tributary or excavated in a tributary.

(ii) Ditches with intermittent flow that are not a relocated tributary, excavated in a tributary, or drain wetlands.

(iii) Ditches that do not flow, either directly or through another water, into a water identified in paragraphs (a)(1) through (3) of this section.

(4) The following features:

(i) Artificially irrigated areas that would revert to dry land should application of water to that area cease;

(ii) Artificial, constructed lakes and ponds created in dry land such as farm and stock watering ponds, irrigation ponds, settling basins, fields flooded for rice growing, log cleaning ponds, or cooling ponds;

(iii) Artificial reflecting pools or swimming pools created in dry land;

(iv) Small ornamental waters created in dry land;

(v) Water-filled depressions created in dry land incidental to mining or construction activity, including pits excavated for obtaining fill, sand, or gravel that fill with water;

(vi) Erosional features, including gullies, rills, and other ephemeral features that do not meet the definition of tributary, non-wetland swales, and lawfully constructed grassed waterways; and

(vii) Puddles.

(5) Groundwater, including groundwater drained through subsurface drainage systems.

(6) Stormwater control features constructed to convey, treat, or store stormwater that are created in dry land.

(7) Wastewater recycling structures constructed in dry land; detention and retention basins built for wastewater recycling; groundwater recharge basins; percolation ponds built for wastewater recycling; and water distributary structures built for wastewater recycling.

Other features may be excluded based on Federal court rulings (e.g., SWANCC and Rapanos) or by regulation.

Permits, licenses, variances, or similar authorization may also be required by other federal, state, and local statutes. Section 10 of the Rivers and Harbors Act of 1899 prohibits the obstruction or alteration of navigable WOTUS without a permit from the USACE (33 USC 403).

On January 23, 2020 the EPA and the USACE finalized the Navigable Waters Protection Rule to define Waters of the U.S. and establish federal regulatory authority under the CWA. The rule will become effective 60 days after publication in the *Federal Register*. On April 21, 2020, the EPA and USACE published the Navigable Waters Protection Rule to define "Waters of the United States" in the Federal Register. On June 22, 2020 the Navigable Waters Protection Rule: Definition of "Waters of the United States" (NWPR) became effective in 49 states, including California, and in all US territories.

3.1.2 State Jurisdiction

Regional Water Quality Control Board

Any action requiring a CWA Section 404 permit must also obtain a CWA Section 401 Water Quality Certification. The State of California Water Quality Certification (WQC) Program was formally initiated by the State Water Resources Control Board (SWRCB) in 1990 under the requirements stipulated by Section 401 of the Federal CWA. Although the Clean Water Act is a Federal law, Section 401 of the CWA recognizes that states have the primary authority and responsibility for setting water quality standards. In California, under Section 401, the State and Regional Water Boards are the authorities that certify that issuance of a federal license or permit does not violate California's water quality standards (i.e., that they do not violate Porter-Cologne and the Water Code). The WQC Program currently issues the WQC for discharges requiring USACE permits for fill and dredge discharges within Waters of the United States, and now also implements the State's wetland protection and hydromodification regulation program under the Porter Cologne Water Quality Control Act.

On April 2, 2019, the SWRCB adopted a State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State (Procedures), for inclusion in the forthcoming Water Quality Control Plan for Inland Surface Waters and Enclosed Bays and Estuaries and Ocean Waters of California. The Procedures consist of four major elements: 1) a wetland definition; 2) a framework for determining if a feature that meets the wetland definition is a water of the state; 3) wetland delineation procedures; and 4) procedures for the submittal, review and approval of applications for Water Quality Certifications and Waste Discharge Requirements for dredge or fill activities. The Office of administrative Law approved the Procedures on August 28, 2019, and the Procedures became effective May 28, 2020.

Under the Procedures and the State Water Code (Water Code §13050(e)), "Waters of the State" are defined as "any surface water or groundwater, including saline waters, within the boundaries of the state." Unless excluded by the Procedures, any activity that could result in discharge of dredged or fill material to Waters of the State, which includes Waters of the U.S. and non-federal Waters of the State, requires filing of an application under the Procedures.

The Porter-Cologne Water Quality Control Act (Porter-Cologne Act, Water Code Section 13000 et seq.) is California's statutory authority for the protection of water quality in conjunction with the federal CWA. The Porter-Cologne Act requires the SWRCB and RWQCBs under the CWA to adopt and periodically update water quality control plans, or basin plans. Basin plans are plans in which beneficial uses, water quality objectives, and implementation programs are established for each of the nine regions in California. The Porter-Cologne Act also requires dischargers of pollutants or dredged or fill material to notify the RWQCBs of such activities by filing Reports of Waste Discharge and authorizes the SWRCB and RWQCBs to issue and enforce waste discharge requirements, National Pollution Discharge Elimination System (NPDES) permits, Section 401 water quality certifications, or other approvals.

3.2 RIPARIAN HABITAT/SECTION 1600 OF FISH AND GAME CODE

The California Department of Fish and Wildlife (CDFW) is a trustee agency that has jurisdiction under Section 1600 et seq. of the California Fish and Game Code. Under Sections 1602 and 1603, a private party must notify CDFW if a proposed project will "substantially divert or obstruct the natural flow or substantially change the bed, channel, or bank of any river, stream, or lake designated by the department, or use any material from the streambed, except when the department has been notified

pursuant to Section 1601." Additionally, CDFW asserts jurisdiction over native riparian habitat adjacent to aquatic features, including native trees over four inches in diameter at breast height (DBH). If an existing fish or wildlife resource may be substantially adversely affected by the activity, CDFW may propose reasonable measures that will allow protection of those resources. If these measures are agreeable to the parties involved, they may enter into an agreement with CDFW identifying the approved activities and associated mitigation measures. Generally, CDFW recommends that an application for a Streambed Alteration Agreement (SAA) be submitted for any work done within the lateral limit of water flow or the edge of riparian vegetation, whichever is greater.

3.3 PROTECTED SPECIES

3.3.1 Federal Endangered Species Act

The U.S. Fish and Wildlife Service (USFWS) enforces the provisions stipulated within the Federal Endangered Species Act of 1973 (FESA; 16 USC 1531 et seq.). Species identified as federally threatened or endangered (50 CFR 17.11, and 17.12) are protected from take, defined as direct or indirect harm, unless a Section 10 permit is granted to an entity other than a federal agency or a Biological Opinion with incidental take provisions is rendered to a federal lead agency via a Section 7 consultation. Pursuant to the requirements of FESA, an agency reviewing a proposed project within its jurisdiction must determine whether any federally-listed species may be present in the study area and determine whether the proposed project will jeopardize the continued existence of or result in the destruction or adverse modification of critical habitat of such species (16 USC 1536 (a)[3], [4]). Other federal agencies designate species of concern (species that have the potential to become listed), which are evaluated during environmental review under the National Environmental Protection Act (NEPA) or CEQA although they are not otherwise protected under FESA.

3.3.2 California Endangered Species Act and Fully Protected Species

The California Endangered Species Act (CESA) (California Fish and Game Code Sections 2050 to 2097) is similar to the FESA. The California Fish and Wildlife Commission is responsible for maintaining lists of threatened and endangered species under CESA. CESA prohibits the take of listed and candidate (petitioned to be listed) species. "Take" under California law means to hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch capture, or kill (California Fish and Game Code, Section 86). The CDFW can authorize take of a state-listed species under Section 2081 of the California Fish and Game Code if the take is incidental to an otherwise lawful activity, the impacts are minimized and fully mitigated, funding is ensured to implement and monitor mitigation measures, and CDFW determines that issuance would not jeopardize the continued existence of the species. A CESA permit must be obtained if a project will result in the "take" of listed species, either during construction or over the life of the project. For species listed under both FESA and CESA requiring a Biological Opinion under Section 7 of the FESA, CDFW may also authorize impacts to CESA species by issuing a Consistency Determination under Section 2080.1 of the Fish and Game Code.

Legal protection is also provided for wildlife species in California that are identified as "fully protected animals." These species are protected under Sections 3511 (birds), 4700 (mammals), 5050 (reptiles and amphibians), and 5515 (fish) of the California Fish and Game Code. These statutes prohibit take or possession of fully protected species at any time. CDFW is unable to authorize incidental take of fully protected species when activities are proposed in areas inhabited by these species. CDFW has informed non-federal agencies and private parties that they must avoid take of any fully protected species in

carrying out projects. However, Senate Bill 618 (2011) allows the CDFW to issue permits authorizing the incidental take of fully protected species under the CESA, so long as any such take authorization is issued in conjunction with the approval of a Natural Community Conservation Plan that covers the fully protected species (California Fish and Game Code Section 2835).

3.4 CEQA SIGNIFICANCE

Section 15064.7 of the State CEQA Guidelines encourages local agencies to develop and publish the thresholds that the agency uses in determining the significance of environmental effects caused by projects under its review. However, agencies may also rely upon the guidance provided by the expanded Initial Study Checklist included in Appendix G of the CEQA Guidelines. Appendix G provides examples of impacts that would normally be considered significant. Based on these examples, impacts to biological resources would normally be considered significant if the project would:

- Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS;

- Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the CDFW or USFWS;

- Have a substantial adverse effect on State or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means;

- Interfere substantially with the movement of any native resident or migratory fish or wildlife species, or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites;

- Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance; and

- Conflict with the provisions of an adopted Habitat Conservation Plan (HCP), Natural Community Conservation Plan (NCCP), or other approved local, regional or state habitat conservation plan.

An evaluation of whether or not an impact on biological resources would be substantial must consider both the resource itself and how that resource fits into a regional or local context. Substantial impacts would be those that would diminish, or result in the loss of, an important biological resource, or those that would obviously conflict with local, State, or federal resource conservation plans, goals, or regulations. Impacts are sometimes locally important but not significant according to CEQA. The reason for this is that although the impacts would result in an adverse alteration of existing conditions, they would not substantially diminish, or result in the permanent loss of, an important resource on a population-wide or region-wide basis.

3.4.1 California Native Plant Protection Act

The California Native Plant Protection Act of 1977 (California Fish and Game Code Sections 1900-1913) requires all state agencies to use their authority to carry out programs to conserve endangered and

otherwise rare species of native plants. Provisions of the act prohibit the taking of listed plants from the wild and require notification of CDFW at least 10 days in advance of any change in land use (other than changing from one agricultural use to another), which allows CDFW to salvage listed plants that would otherwise be destroyed.

The California Native Plant Society (CNPS) is a non-governmental conservation organization that has developed a list of plants of special concern in California. This information is published in the *Inventory of Rare and Endangered Vascular Plants of California*. Potential impacts to populations of CNPS-ranked plants receive consideration under CEQA review. The following identifies the definitions of the CNPS Rare Plant Ranking System:

Rank 1A: Plants presumed Extinct in California and either rare or extinct elsewhere

Rank 1B: Plants Rare, Threatened, or Endangered in California and elsewhere

Rank 2A: Plants presumed extirpated in California but common elsewhere

Rank 2B: Plants Rare, Threatened, or Endangered in California, but more common elsewhere

Rank 3: Plants about which we need more information – A Review List

Rank 4: Plants of limited distribution – A Watch List

Although the CNPS is not a regulatory agency and plants on these lists have no formal regulatory protection, plants with a Ranking of 1A through 2B may be considered to meet the definition of endangered, rare, or threatened species under Section 15380(d) of CEQA (see above), and impacts to these species may be considered "significant."

In addition, CDFW recommends, and local governments may require, protection of species which are regionally significant, such as locally rare species, disjunct populations, essential nesting and roosting habitat for more common wildlife species, or plants with a CNPS Ranking of 3 and 4.

3.4.2 California Department of Fish and Wildlife Species of Concern

Some additional fish, amphibian, reptile, bird, and mammal species may receive consideration by CDFW and lead agencies during the CEQA process, in addition to species that are formally listed under FESA or CESA or are fully protected. These species are included on the Special Animals List, which is maintained by CDFW. This list tracks species in California whose numbers, reproductive success, or habitat may be in decline. In addition to "Species of Special Concern" (SSC), the Special Animals List includes species that are tracked in the California Natural Diversity Database (CNDDB) but warrant no legal protection. These species are identified as "California Special Animals" (CSA).

Additionally, California Fish and Game Code Subsections 3503 and 3800 prohibit the possession, take, or needless destruction of birds, their nests, and eggs, and the salvage of dead nongame birds. California Fish and Game Code Subsection 3503.5 protects all birds in the orders of Falconiformes and Strigiformes (birds of prey). Fish and Game Code Subsection 3511 states that fully protected birds or parts thereof may not be taken or possessed at any time. Fish and Game Code Subsection 3513 states that it is unlawful to take or possess any migratory nongame bird as designated in the Migratory Bird Treaty Act or any part of such migratory nongame bird except as provided by rules and regulations adopted by the Secretary of the Interior under provisions of the Migratory Bird Treaty Act. The Attorney General of California has released an opinion that the Fish and Game Code prohibits incidental take.

3.5 ROSEVILLE NATIVE OAK TREE ORDINANCE

The City of Roseville (City) Native Oak Tree Ordinance (Ordinance) regulates encroachment within the protected zone and removal of protected trees (City of Roseville 2020a). Protected trees include any native oak, defined as valley oak (*Quercus lobata*), blue oak (*Quercus douglasii*), interior live oak (*Quercus wislizeni*), or any hybrid between these species, with a trunk diameter of six inches or greater at breast height (54 inches or 4.5-feet above grade) measured as a total of a single trunk or multiple trunks. The tree protection zone) is the area within a circle around the tree defined by the largest radius of the canopy plus one foot.

City projects, such as the Mahany Trail Project, do not require a tree permit, but are required to comply with the preservation and mitigation requirements of the Native Oak Tree Ordinance. The City requires mitigation for tree removal. However, trees identified by an arborist as dead or hazardous trees do not require mitigation. The City may approve any of the following methods or combination thereof; however, on-site tree replacement is the preferred method.

- Replacement trees may be planted on-site or in other areas where maintenance and irrigation are provided to ensure survival of the trees. Removal of protected trees to be replaced shall be calculated based upon an inch for an inch replacement of the DBH of the removed tree(s) where:
    - One 15-gallon tree will replace 1-inch DBH of the removed tree;
    - One 24-inch box tree will replace two inches; and
    - One 36-inch box tree will replace three inches.

  The replacement trees shall have a combined diameter equivalent not less than the total diameter of the tree(s) removed. A minimum of 50 percent of the replacement requirement shall be met with native oak trees and up to 50 percent may be fulfilled with non-native species;

- Relocation of native oak trees from one area to another, may be considered by the City in certain cases. Credit shall be given for relocation on the same basis as replacement, and guidelines and limitations for relocation are outlined under the Ordinance;

- Implementation of a revegetation program to propagate native oak trees from seed using currently accepted methods; and/or

- Payment of an in-lieu mitigation fee, if the City determines that the other methods outlined above are not feasible or desirable.

4.0 HABITATS AND SPECIAL-STATUS SPECIES

The ±133-acre Study Area includes 95.25 acres of annual grassland, 5.96 acres of oak woodland, 5.24 acres riparian woodland, and 4.34 acres of disturbed area. Aquatic features include 18.01 acres of vernal pools, 2.43 acres of seasonal wetlands, 0.38 acre of seasonal drainage, and 1.43 acres of perennial drainage (Kaseberg Creek), all of which are anticipated to be jurisdictional waters. Paved multi-use trails and a gravel access road that leads to an existing utility building transects the central portions of the Study Area. Many overhead utility lines cross the site, including three lines of high-voltage transmission towers and two lines of utility poles. Numerous informal dirt paths cross the annual grassland, oak woodland, and portions of the riparian habitat (Figure 2).

Regionally occurring special-status species were identified by conducting a search of the California Natural Diversity Database (CDFW 2020), the CNPS Ranking List (CNPS 2020), and the USFWS IPaC list (USFWS 2020) for special-status species documented within the P*leasant Grove, Nicolaus, Sheridan, Verona, Roseville, Taylor Monument, Rio Linda, and Citrus Heights* USGS quadrangles. HELIX biologist Marisa Brilts conducted a biological constraints level survey on February 17 and 18, 2020. An arborist survey was also conducted within the Study Area by a HELIX International Society of Arboriculture (ISA)-Certified Arborist Charlotte Marks (WE-10519A) on February 17, 18, and 19, 2020.

A total of forty-four special-status wildlife and thirteen special-status plant species have the potential to be found in the vicinity of the Study Area (Appendix A). Based on research and site conditions, twenty-four special-status wildlife and nine special-status plants have the potential to occur within the Study Area. Special-status wildlife species with potential to occur in the Study Area are burrowing owl (*Athene cunicularia*), Swainson's hawk (*Buteo swainsoni*), western spadefoot toad (*Spea hammondii*), western pond turtle (*Actinemys marmorata*), pallid bat (*Antrozous pallidus*), valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*), and andrenid bee (*Andrena subapasta*). Additionally, there is potential for nesting birds and raptors, including grasshopper sparrow (*Ammodramus savannarum*), long-billed curlew (*Numenius americanus*), purple martin (*Progne subis*), Nuttall's woodpecker (*Picoides nuttallii*), oak titmouse (*Baeolophus inornatus*), yellow-billed magpie (*Pica nuttalli*), black-crowned night heron (*Nycticorax nycticorax*), common yellowthroat (*Geothlypis trichas*), great blue heron (*Ardea herodias*), great egret (*Ardea alba*), song sparrow (Modesto population) (*Melospiza melodia*), tricolored blackbird (*Agelaius tricolor*), and white-tailed kite (*Elanus leucurus*), and vernal pool invertebrates, including California linderiella (*Linderiella occidentalis*), Ricksecker's water scavenger beetle (*Hydrochara rickseckeri*), vernal pool fairy shrimp (*Branchinecta lynchi*), and vernal pool tadpole shrimp (*Lepidurus packardi*), to occur. Special-status plant species with the potential to occur within the Study Area include stinkbells (*Fritillaria agrestis*), Sanford's arrowhead (*Sagittaria sanfordii*), Ahart's dwarf rush (*Juncus leiospermus* var*. ahartii*), Boggs Lake hedge-hyssop (*Gratiola heterosepala*), dwarf downingia (*Downingia pusilla*), legenere (*Legenere limosa*), pincushion navarretia (*Navarretia myersii* ssp. *myersii*), Red Bluff dwarf rush (*Juncus leiospermus*), and valley brodiaea (*Brodiaea rosea* ssp. *vallicola*).

Table 1, below, lists the habitats and the number of special-status species that could occur within that habitat (note that a species may occur in multiple habitats). For example, Swainson's hawk may forage in the annual grasslands and has the potential to nest in the oak woodland, therefore this species is identified in both habitats. Information on these species is included in the discussion of the appropriate habitat below. Species observed during field surveys are included in Appendix B and representative site photos are included in Appendix C.

Table 1
HABITATS AND POTENTIAL SPECIAL-STATUS SPECIES

Habitat	Acres	Potential Special-Status Species	
		Wildlife	*Plants*
Annual Grassland	95.25	Burrowing owl *Swainson's hawk Nesting birds and raptors Western spadefoot toad	Stinkbells
Oak Woodland	5.96	Nesting birds and raptors *Pallid bat	
Riparian Woodland and Creek	6.67	Nesting birds and raptors *Pallid bat *Swainson's hawk Western pond turtle Valley elderberry longhorn beetle *Andrenid bee	Sanford's arrowhead
Vernal Pool	18.01	Vernal pool invertebrates Western spadefoot toad *Andrenid bee	Boggs Lake hedge Dwarf downingia Legenere Pincushion navarretia Red bluff dwarf rush Valley brodiaea

(*) Species has the potential to occur in multiple habitats.

Biological Communities

Figure 2

4.1 ANNUAL GRASSLAND

Annual grassland occurs within the majority of the Study Area, Figure 2. The annual grassland landscape supports many different grasses, forbs, and isolated small clusters of trees and shrubs. Growth occurs during early spring turning the landscape green. During the summer many of the plants in this community are dormant. Plants commonly found in the annual grassland include wild oat (*Avena fatua*), Italian ryegrass (*Festuca perennis*), barley (*Hordeum marinum*), brome (*Bromus* sp.), wild rye (*Elymus* sp.), and medusa head (*Elymus caput-medusae*), as well as forbs such as filarees (*Erodium* spp.) and mustard (*Brassica* sp.). California's Mediterranean type grasslands are recognized among the world's "hot spots" of native biodiversity, despite being generally dominated by non-native species (Bartolome et al. 2014).

Within the annual grasslands are seasonal wetland and drainages, as well as vernal pools, which are discussed in more detail below. Seasonal wetlands and drainages are dependent on rainfall and they can be inundated for days to weeks after a storm.

Black-tailed deer (*Odocoileus hemionus columbianus*), black-tailed jackrabbit (*Lepus californicus*), California ground squirrel (*Spermophilus beecheyi*), pocket gopher (*Thomomys bottae*), and house mouse (*Mus musculus*) were documented within the Study Area. Western meadowlarks (*Sturnella neglecta*) and western kingbirds (*Tyrannus verticalis*) feed on insects and seeds, red tailed hawks (*Buteo jamaicensis*), northern harrier (*Circus cyaneus*), and red shouldered hawks (*Buteo lineatus*) feed on gophers and mice that are commonly found within annual grassland habitats. Evidence and/or observations of these species was noted during the field survey of the Study Area. Additional species observed are listed in Appendix B.

Appendix A lists the number of known CNDDB occurrences of special-status species within a 5-mile radius of the Study Area as well as additional information about special-status species with the potential to occur within the Study Area. Swainson's hawk has the potential to forage in the annual grassland and is discussed in further detail in Section 4.3 – Riparian Woodland and Creek.

4.1.1 Burrowing Owl

Burrowing owl is a California Species of Special Concern. This small ground-dwelling owl generally inhabits gently sloping areas, characterized by low, sparse vegetation (Poulin et al. 2011). The breeding season for burrowing owls is from February to August, peaking in April and May (Zeiner et al. 1990). Burrowing owls nest in burrows in the ground, often in old ground squirrel burrows. Burrowing owls are also known to use artificial burrows including pipes, culverts, and nest boxes. The annual grassland and existing ground squirrel burrows within this community provide suitable habitat for this species within the Study Area. The burrows within the annual grassland and drainages/culverts provide wintering and nesting habitat for this species. This species is predominantly non-migratory in California.

4.1.2 Grasshopper Sparrow

Grasshopper sparrow is a California Species of Special Concern. This small sparrow frequents annual grassland and grasshopper sparrow nests are often constructed at the base of an overhanging clump of grass. These weak fliers don't tend to fly around much but rather scurry on the ground like mice (Cornell Lab of Ornithology 2019). This migratory bird is observed between April and June during the summer breeding season in California.

4.1.3 Long-Billed Curlew

Long-billed curlew is a Bird of Conservation Concern. It is the largest bird in the sandpiper family. The long-billed curlew nests in low-growing vegetation (4 to 8-inches high) and is often found in annual grasslands and vernal pools during the summer breeding months. In the winter, they migrate to the coast where they inhabit wetlands, tidal estuaries, mudflats, flooded fields, and occasionally beaches (Cornell Lab of Ornithology 2019).

4.1.4 Purple Martin

The purple martin is California Species of Special Concern. This species is in the swallow family and is known to perform aerial acrobatics to snap up flying insects. They nest in wide variety of open annual grasslands and partially open habitats like the of the riparian woodland and creek and oak woodland communities within the Study Area. They nest in tree cavities, abandoned woodpecker holes, crevices in rocks, and sometimes in bird houses or gourds put up by humans. At the end of the summer breeding season they gather in big flocks and make their way to South America (Hood 2017).

4.1.5 Tricolored Blackbird

The tricolored blackbird is a California Threatened Species. Tricolored blackbirds look very much like their cousin, the red-winged blackbird. What distinguishes these two species from one and other is the addition of the white strip on the shoulder of the tricolored blackbird. Male tricolored blackbirds are entirely black with a bright red shoulder patch bordered below by a white to cream-colored band. Females are dark gray-brown overall. This species forages in grasslands and breeds in freshwater marshes. Nests occur in large colonies of up to thousands of individuals (NatureServe 2020). Nesting locations must be large enough to support a minimum colony of approximately fifty pairs (Zeiner et al. 1990). This species forages in grasslands and agricultural fields with low-growing vegetation (Shuford and Gardladi 2008).

4.1.6 Western Spadefoot Toad

Western spadefoot toad is a California Species of Special Concern. This species spends most of the year underground, where individuals seek refuge from desiccation by constructing and residing in small burrows. Adults emerge from underground with the onset of the first rains of the season (Zeiner et al. 1988-1990). Breeding and egg laying occur in temporary pools and quiet streams. Breeding typically end in March, but may extend as late as May, depending on rainfall (Stebbins 2003; Zeiner et al. 1988-1990). Egg masses contain approximately 10 to 42 eggs, and are attached to vegetation or other submerged objects, and hatch within approximately two weeks (Zeiner et al. 1988-1990). Western spadefoot toads are most commonly found in grassland habitats containing vernal pool complexes but can also be found in burrows adjacent to drainages. This species has been found to move an average of 800 feet from its breeding pool (Muths 2003). Its skin is smoother than that of the wester toad and it has two pale strips along its back. The “spade” is a sharp, black ridge on its hind feet that enables the toad to dig its burrow.

4.1.7 Stinkbells

Stinkbells are a CNPS Rare Plant Rank 4.2 plant species. Stinkbells are a perennial bulbiferous herb found in clay soils, sometimes in serpentinite soil in moist annul grasslands. Flowers are white with greenish to

pinkish markings on the outer surface and purple brown on the inner surface. The flowers have an unpleasant odor, hence its name. The typical bloom period is between March and June (CNPS 2020).

4.2 OAK WOODLAND

Oak woodland is located in the eastern and central portions of the Study Area (Figure 2). Denser stands of large, mature oaks are located in the north and central portions of the Study Area associated with Kaseberg Creek.

The oak woodland within the Study Area is primarily characterized by an overstory of native oak trees including blue oak, interior live oak, and valley oak. The understory is mostly devoid of other woody vegetation and is composed primarily of non-native annual grasses like that found in the annual grassland community. Woody plants that were observed in this community include poison oak (*Toxicodendron diversilobum*) and Himalayan blackberry (*Rubus armeniacus*).

Acorn woodpeckers (*Melanerpes formicivorus*) were seen adding acorns to acorn granaries, northern flickers (*Colaptes auratus*), a red-tailed hawk, California scrub jays (*Aphelocoma californica*), American crow (*Corvus brachyrhynchos*), and red shouldered hawk were observed perched in trees or soaring above the oak woodland. In addition, a great horned owl (*Bubo virginianus*) was observed in its nest in an oak in the northeastern section of the oak woodland see Figure 2 for approximate nest location.

Special-status species with the potential to occur in the oak woodland habitat are listed below. Appendix A lists the number of known CNDDB occurrences of special-status species within a 5 miles radius of the Study Area as well as additional information about special-status species with the potential to occur. Purple martin and stinkbells were previously discussed under Section 4.1 – Annual Grassland, as these species have the potential to occur within the annual grassland as well as the oak woodland.

4.2.1 Nuttall's Woodpecker

Nuttall's woodpecker is a Bird of Conservation Concern. This small woodpecker has black and white spots covering most of its body. Males have a bright red crown where females lack this. Nesting occurs primarily in oak cavities (Cornell Lab of Ornithology 2019) and this species in non-migratory.

4.2.2 Oak Titmouse

Oak titmouse is a Bird of Conservation Concern. This species is about the size of a sparrow. This rather plain gray bird has a crest on its head. It nests in natural tree cavities or in woodpecker holes (Hood 2017) and this species is non-migratory.

4.2.3 Pallid Bat

Pallid bat is a California Species of Special Concern. This bat is yellowish brown to cream colored. A distinguishing characteristic is its large ears that are almost half as long as the total length of its head and body. Also, its eyes are larger than most species of North American bats. Day roosts are located in crevices and occasionally in hollow trees and buildings. Pallid bats forage over riparian woodland and creek habitat. Roosts must protect bats from high temperatures during the day (Barbour; Davis 1969). This species can be observed year-round.

4.2.4 Yellow-Billed Magpie

Yellow-billed magpie or "California magpie" is a Bird of Conservation Concern. This species is only found in California and nowhere else in the world. This boisterous bird is about the size of a crow with a long tail. Its white belly and wing patches stand out against the black of its head and tail. Yellow-billed magpies' nest in tall trees averaging 47 feet often in clumps of mistletoe (Hood 2017).

4.3 RIPARIAN WOODLAND AND CREEK

Riparian woodland and Kaseberg Creek are located in the northeast portion of the Study Area. The overstory of this community is comprised of willows (*Salix* sp.) cottonwoods (*Populus fremontii* ssp. *fremontii*), and oaks. The understory, specifically southwest of Bear Dog Park and south of Pleasant Grove Boulevard, is comprised of vines and brush such as wild grape (*Vitis californica*), coyote bush (*Baccharis pilularis*), and Himalayan blackberry.

Kaseberg Creek exhibits a bed, bank, and OHWM. The creek is not highly vegetated because of the scouring effect of fast-moving water; however, sections of the creek were colonized by plants including sedges (*Carex* sp.), rushes (*Juncus* sp.), and willows (*Salix* sp.*).*

Special-status species with the potential to occur in the riparian and creek habitat are listed below. Appendix A lists the number of known CNDDB occurrences of special-status species within a 5 miles radius of the Study Area as well as additional information about special-status species with the potential to occur. Purple martin has the potential to nest and feed within the riparian and creek habitat. This species was previously discussed in Section 4.1 – Annual Grassland.

4.3.1 Black-crowned Night Heron

The black-crowned night heron is considered a California Special Animal. This primarily nocturnal, short-necked heron comes out at dusk to hunt on a variety of prey including insects, small fish, and rodents. Adults have a dark black crown and back. This species in non-migratory in this region (Hayes et al. 2006).

4.3.2 Common Yellowthroat

Common yellowthroat is a Bird of Conservation Concern. This small sparrow sized bird has yellow plumage around its throat. This species feeds in moist areas typically along creeks and drainages and nests are woven by females using various grasses (Hood 2017). This non-migratory bird is observed year-round.

4.3.3 Great Blue Heron

Great blue heron is considered a California Special Animal. This large bird stands about 4 feet tall with a wingspan of 6 feet (Hood 2017). This grey-blue bird is an expert fisherman, hunting in vernal pools, creeks, and wetlands. This non-migratory bird is observed year-round.

4.3.4 Great Egret

The great egret is considered a California Special Animal. This large all white bird has a long neck and stands about 3 feet tall. Egrets feed by wading through the water slowly, then spearing their prey with a sudden lunge (Cornell Lab of Ornithology 2019) This non-migratory bird is observed year-round.

4.3.5 Song Sparrow ("Modesto" Population)

Song sparrow is a California Species of Concern. This medium sized bulky sparrow is found in thickets and bushes. Their coloring includes brown upperparts with dark streaks on the back with white underneath with dark streaking and a dark brown spot in the middle of the breast. They have a brown cap and a long brown rounded tail (Cornell Lab of Ornithology 2019). This non-migratory bird is observed year-round.

4.3.6 Swainson's Hawk

Swainson's hawk is a California Threatened Species. They arrive in the Central Valley between March and early April to establish breeding territories. Breeding occurs from late March to late August, peaking in late May through July (Zeiner et al. 1990). In the Central Valley, Swainson's hawks nest in isolated trees, small groves, or large woodlands next to open grasslands or agricultural fields. This species typically nests near riparian areas; however, it has been known to nest in urban areas as well. In the Central Valley, the most commonly used trees include cottonwoods, willows, sycamores (*Platanus* sp.), valley oaks, walnuts (*Juglans* sp.), and occasionally gum trees (*Eucalyptus* sp.), pines (*Pinus* sp.) and redwoods (*Sequoia sempervirens*) (Woodbridge 1998). Nest locations are typically located within a 10-mile radius of suitable foraging habitats, which include annual grassland and agricultural fields. There are seven historic nest locations recorded within 5 miles of the Study Area. Swainson's hawks leave their breeding grounds to return to their wintering grounds in late August or early September.

4.3.7 White-Tailed Kite

White-tailed kite is a California Fully Protected Species. This largely pale raptor is easily identified by its entirely white tail and black shoulder patches. It has a unique way of hunting; the white-tailed kite rapidly beats its wings allowing it to hover in place. During the nonbreeding season, it gathers in communal roosts (Cornell Lab of Ornithology 2019). This non-migratory bird is observed year-round. This species was observed in the Study Area during the February 17 and 18, 2020 field survey.

4.3.8 Valley Elderberry Longhorn Beetle

The valley elderberry longhorn beetle is a Federally Threatened Species. It is associated with elderberry shrubs (*Sambucus* sp.) often within riparian habitats. Adult males have red-orange wing covers with four elongate spots. Adult females have dark colored wing coverings. Females lay their eggs on the bark of elderberry shrubs. Larvae hatch and burrow into the stems, and presence can be indicated by bore-holes in stems of elderberries (USFWS 2017). Although no elderberry shrubs were observed during the field survey, a section of riparian habitat located adjacent to Bear Dog Park, in the northeastern portion of the Study Area was not fully accessible due to thick undergrowth. Therefore, there is the potential that suitable habitat exists in the Study Area for valley elderberry longhorn beetle.

4.3.9 Western Pond Turtle

Western pond turtle is a California Species of Special Concern. This species occurs in ponds, lakes, rivers, streams, creeks, marshes, and irrigation ditches with suitable basking sites. Suitable aquatic habitat typically has a muddy or rocky bottom. Western pond turtles nest and overwinter in areas of sparse vegetation, usually grassland, typically within 500 feet of aquatic habitat. The typical shell coloring is dark brown, blackish or olive a network of with lines and spots (Hayes et al. 2006). Western pond turtle may be present in the Study Area year-round.

4.3.10 Sanford's Arrowhead

Sanford's arrowhead is a CNPS Rare Plant Rank 1B.2 plant species. This aquatic perennial herb has leaves that are very often submerged, variable in shape, usually long and strap-shaped like an arrowhead. The plant is monoecious, with individuals bearing both male and female flowers. The male flowers have rings of stamens at the centers. Female flowers each have a spherical cluster of pistils which develops into a head of tiny fruits. The typical bloom period is May through October (CNPS 2020).

4.4 VERNAL POOLS

Vernal pools are found within the annual grasslands of the Study Area where impervious layers of clay underlie the surface soil. Vernal pools have three distinct phases: the wet phase, the flowering phase, and the dry phase. The vernal pools in the Study Area were just entering the flowering phase during the February 17 and 18 site survey, however, some deeper pools were still inundated. Common vernal pools species observed within the Study Area included woolly marbles (*Psilocarphus brevissimus*), spikerush (*Eleocharis macrostachy*), and popcorn-flower (*Plagiobothrys stipitatus*). Additionally, a common garter snake (*Thamnophis sirtalis)* was observed.

During the wet phase or rainy season, which typically occurs between November and March (April), pools fill with water creating habitats for a unique array of plants and animals. Aquatic life is teeming in the vernal pools. In addition to listed vernal pool invertebrates, water fleas (Cladocera), copepods (Copepoda), seed shrimp (Ostracoda), flatworms (Turbellaria), diving water beetles (Dytiscidae), midges (Chironomidae), crawling water beetles (Haliplidae), and Sierran treefrog (*Pseudacris sierra*) have the potential to occur within the pools. Typically, around March the vernal pools start to dry up and flowers start to emerge. Vivid yellow concentric rings are sometimes seen around the perimeter of the pool. Pink, purple, and white flowers bloom. During the summer months, vernal pools blend into the dry annual grassland landscape. Mammals, like ground squirrels and jack rabbits, birds, and insects all come to the dry pools to feed on the seeds and bulbs of the vernal pool plants. Other larger species, like raptors, feed on them.

Special-status species with the potential to occur in the vernal pool habitat are listed below. Appendix A lists the number of known CNDDB occurrences of special-status species within a 5 miles radius of the Study Area as well as additional information about special-status species. Long-billed curlew has the potential to feed in the vernal pools in the wet season, western spadefoot toad has the potential to breed and lay eggs during the wet season. Both species are discussed in Section 4.1 – Annual Grassland. Herons and egrets have the potential to feed in the vernal pools and are discussed in Section 4.3 – Riparian Woodland and Creek.

4.4.1 Andrenid Bee

Andrenid bees are California Special Animals. These ground nesters will be underground in the summer, fall and winter and emerge in early spring to forage and pollinate early blooming plants, such as willows and other early blooming wildflowers found in vernal pools, annual grasslands, and riparian woodland.

4.4.2 California Linderiella

California linderiella is a California Special Animal. Cysts containing the invertebrates hatch soon after the vernal pools become inundated. The cysts can stay dormant as the vernal pool dries and they can withstand extreme environmental conditions until they hatch (Eriksen and Belk 1999). Unlike the other fairy shrimp, the California linderiella is a member of the family Linderiellidae. It is smaller than fairy shrimp in the family Branchinectidae, typically ~10 millimeters (0.39 inch) in length and has red eyes (Dodds 1923).

4.4.3 Ricksecker's Water Scavenger Beetle

Ricksecker's water scavenger beetle is a California Special Animal. These aquatic beetles are known to occur in vernal pools. Ideal habitat includes, neutral to slightly alkaline, clear, low dissolved salts, dominated with vernal pool plant species, and complex of vernal pool crustacean species.

4.4.4 Vernal Pool Fairy Shrimp

Vernal pool fairy shrimp are Federally listed as Threatened. Cysts containing the invertebrates hatch soon after the vernal pool becomes inundated. The cysts can stay dormant as the vernal pool dries and they can withstand extreme environmental conditions until they hatch. Cyst dispersal can occur through watershed connections of freshwater habitats or via bird discharge (cysts are consumed by a bird and deposited in other habitats) (Eriksen and Belk 1999).

4.4.5 Vernal Pool Tadpole Shrimp

Vernal pool tadpole shrimp are Federally listed as Endangered. One of the largest crustaceans found in vernal pools, vernal pool tadpole shrimp produce cysts or eggs that lie buried in the soil until the next winter rains trigger the eggs to hatch. The cysts may hatch in as little as 4 days (Ahl 1991). Mature vernal pool tadpole shrimp range from 0.6 to 3.3 inches in length (USFWS 2006). Vernal pool tadpole shrimp have a shield-like cover called a carapace that can be olive-green, brown or gray. Their abdomen sticks out behind the carapace and ends in two long, thin tails.

4.4.6 Ahart's Dwarf Rush

Ahart's dwarf rush is State Listed as Endangered and a CNPS 1B.2 plant species. Ahart's dwarf rush is annual herb that blooms from March through May (CNPS 2020).

4.4.7 Boggs Lake Hedge-Hyssop

Boggs Lake hedge-hyssop is State Listed as Endangered and a CNPS 1B.2 plant species. Flowers are white with light green strips. This species requires fresh-water conditions and usually occurs in vernal pool habitat. The bloom period is from April through August (CNPS 2020).

4.4.8 Dwarf Downingia

Dwarf downingia is a CNPS 2B.2 plant species. A member of the bellflower family this annual herbaceous plant has flowers that are typically white to slight blue. This species requires shallow, fresh-water conditions and usually occurs in vernal pool habitat. The bloom period is March through May (CNPS 2020).

4.4.9 Legenere

Legenere is a CNPS 1B.1 plant species. A member of the bellflower family this annual herbaceous plant requires fresh-water conditions and usually occurs in vernal pool habitat. Flowers are white. The bloom period is April through June (CNPS 2020).

4.4.10 Pincushion Navarretia

Pincushion navarretia is a CNPS 1B.1 plant species. Flowers are white. This species is found in vernal pools, which are often located on acidic soils. The bloom period is April through May (CNPS 2020).

4.4.11 Red Bluff Dwarf Rush

Red Bluff dwarf is a CNPS 1B.1 plant species. This rush is a grass like annual herb in the rush family. This species requires fresh-water conditions and usually occurs in vernal pool habitat. The bloom period is March through June (CNPS 2020).

4.4.12 Valley Brodiaea

Valley brodiaea is a CNPS 4.2 plant species. This perennial bulbiferous species is typically found on silty, sandy, or gravelly loam soils within swales of annual grassland and vernal pools. The bloom period is from April through May or June (CNPS 2020).

4.5 PROTECTED TREES

A total of 259 protected native oak trees were surveyed within the Study Area by ISA-Certified Arborist Charlotte Marks (WE-10519A) on February 17, 18 and 19, 2020. Protected trees identified in the Study Area include 227 blue oaks, 23 interior live oaks, and nine valley oaks. Additionally, 502 non-protected trees including 457 blue oaks, 37 interior live oaks, seven valley oaks and one cork oak tree (*Quercus suber*) were observed within the Study Area but were not individually surveyed. A total of 19 dead native oak trees were mapped within the Study Area. Detailed tree data for all surveyed trees is included in Appendix C. The approximate locations of all surveyed trees are shown on Figure 3. Table 2 shows the number of protected trees by health and structure ratings.

Table 2
NUMBER OF TREES BY HEALTH AND STRUCTURE RATINGS

		Health					
		Good	**Fair-Good**	**Fair**	**Poor-Fair**	**Poor**	**Total Trees**
Structure	**Good**	0	0	0	0	0	**0**
	Fair-Good	0	0	2	0	0	**2**
	Fair	0	0	132	20	0	**152**
	Poor-Fair	0	0	43	31	6	**80**
	Poor	0	0	0	12	13	**25**
	Total Trees	**0**	**0**	**177**	**63**	**19**	**259**

Approximately 68 percent of the trees (177 of 259) are in Fair health and approximately 59 percent (154 of 259) are in Fair or better structure. These trees are typically suitable for preservation and integration into the project even in close proximity to people and property. However, they should be re-assessed during the final project design. A total of 62 trees (24 percent) are recommended for removal due to Poor to Poor-Fair health and structural condition, as noted in Appendix D. These trees may not be suitable for preservation around new development or in areas where people or property may be significantly injured by tree failure. Many of the trees in poor health have moderate to severe trunk rot and/or limb rot, bark wounds, trunk death, and trunk lean, which provide entry points for disease and decay organisms, and are a potential hazard to public safety in the long term. However, dead and dying trees provide vital habitat for wildlife, such as for nesting and breeding, and should be preserved where they do not pose a hazard to people or property. Therefore, even trees in poor condition should be removed only when it is determined that the tree presents an unacceptable risk to the public or infrastructure.

5.0 RECOMMENDATIONS

Special-status species with the potential to occur on the site include nine plant species, burrowing owl, Swainson's hawk, other migratory birds and raptors, pallid bat, western pond turtle, western spadefoot Andrenid bee, vernal pool invertebrates, and valley elderberry longhorn beetle. White-tailed kite and two active bird nests were observed within the Study Area during the field survey.

Table 3 below summarizes recommended avoidance and minimization measures for sensitive habitats, plants, and wildlife that have the potential to occur within the Study Area and additional studies or permitting that may be required. These recommendations are further detailed following the table.

Table 3
SUMMARY OF AVOIDANCE RECOMMENDATIONS

Sensitive Resource	Avoidance Measures During Design	Additional Studies and Avoidance Measures During Construction
Habitat		
Vernal Pool Habitat	Avoid direct impacts and minimize impacts to watershed.	Implement water quality and erosion control measures during construction to prevent runoff into vernal pools.
Riparian Woodland Habitat	Avoid or minimize direct impacts to habitat.	Obtain 1600 Agreement prior to work in riparian areas.
Protected Trees	Avoid or minimize development within the tree protection zone.	Implement tree protection measures and mitigation for impacted trees in accordance with Native Oak Tree Ordinance.
Jurisdictional Waters	Avoid or minimize impacts to jurisdictional waters.	Submit wetland map for verification and obtain applicable permits from the USACE and RWQCB as required prior to construction.
Special-Status Species		
Special-Status Plants	Avoid or minimize direct impacts to vernal pools and Kaseberg Creek.	Conduct focused botanical survey of project footprint and surrounding 50 feet, where accessible, during bloom season prior to construction.
Burrowing Owl	Minimize impacts to annual grassland habitat.	Conduct protocol surveys prior to construction.
Swainson's Hawk	Avoid or minimize removal of mature trees from oak woodland and riparian woodland. Minimize impacts to annual grassland habitat.	Conduct site clearing outside of nesting season. Conduct pre-construction surveys if construction will occur between February 28 and September 15. Implement avoidance measures as required until young have fledged. Implement mitigation for loss of foraging habitat as required.
Raptor Nests and other nesting birds	Avoid or minimize impacts within 50 feet of known active nests.	Conduct site clearing outside of nesting season. Conduct pre-construction surveys if construction will occur between February 1 and August 31. Implement avoidance measures as required until young have fledged.

Table 3 (cont.)
SUMMARY OF AVOIDANCE RECOMMENDATIONS

Sensitive Resource	Avoidance Measures During Design	Additional Studies and Avoidance Measures During Construction
Pallid Bat	Preserve dead trees or trees with hollows to the greatest extent feasible.	Conduct pre-construction surveys and implement construction training and monitoring measures if species is found.
Western Pond Turtle	Avoid or minimize impacts to Kaseberg Creek and within 500 feet of Kaseberg Creek.	Conduct pre-construction surveys and implement construction training and monitoring measures if species is found.
Western Spadefoot Toad	Avoid direct impacts to and minimize impacts within 800 feet of vernal pools and seasonal wetlands.	Conduct pre-construction surveys and implement construction training and monitoring measures if species is found.
Vernal Pool Invertebrate	Avoid direct impacts to vernal pools. Minimize impacts to vernal pool watersheds or construction within 250 feet of pools.	Consult with USFWS to determine extent of project impact once construction documents are completed. Implement water quality and erosion control measures during construction to prevent runoff into vernal pools.
Valley Elderberry Longhorn Beetle	Maintain minimum 20-foot setback from riparian areas that could not be surveyed.	Survey riparian areas within 165 feet of project area for elderberry shrubs.
Andrenid Bee	Minimize impacts to annual grassland habitat.	No species-specific measures.

5.1 SPECIAL-STATUS SPECIES

5.1.1 Special-Status Plants

Nine special-status plants have the potential to occur within the Study Area including stinkbells, Stanford's arrowhead, Ahart's dwarf rush, Boggs Lake hedge-hyssop, dwarf dowiningia, legenere, pincushion navarretia, Red Bluff dwarf rush, and valley brodiaea. These species were not observed during the field survey; however, the survey was not floristic in nature and was conducted outside of the typical identification period for these plants.

Avoidance and Minimization Measures

Special-status plant species have the potential to occur in the annual grassland, riparian woodland, and vernal pools within the Study Area. Since there are no known populations of these species, direct avoidance during design is not feasible. However, impacts to eight of the nine species can be minimized or avoided by avoiding direct impacts to vernal pools and Kaseberg Creek.

Prior to construction of any improvements in the Study Area, a qualified botanist should conduct special-status plant surveys of the Study Area during the appropriate identification period for these species. One survey conducted between April and May will satisfy the blooming period for all nine potentially occurring special-status plant species. If no special-status plants are observed within the Study Area, then a letter report documenting the survey results should be prepared and submitted to the City and no further measures are recommended.

If special-status plants are observed within the Study Area, the location of the special-status plants should be marked with pin flags or other highly visible markers and may also be marked by GPS. The Project proponent should determine if the special-status plant(s) onsite can be avoided by Project design or utilize construction techniques to avoid impacts to the special-status plant species. All special-status plants to be avoided within the Study Area should have exclusion fencing or other highly visible material marking the avoidance area and the avoidance area should remain in place throughout the entire construction period. Prior to commencement of work activities, a designated botanist/biologist should provide a Worker Environmental Awareness Program (WEAP) training to all Project-related personnel. The training should include information on identifying special-status species found on the project site, their ecology and habitat requirements, the Project boundaries, and the avoidance and minimization measures to be followed to avoid impacts to those species. Upon completion of the training, all construction personnel should sign a form stating that they have attended the training and understand all the measures. Proof of this instruction should be kept on file with the Project proponent.

If special-status plants are found within the Study Area and cannot be avoided, the Project proponent should consult with the CDFW and/or the USFWS as appropriate, and depending on the status of the plant species in question, determine appropriate measures to mitigate for the loss of special-status plant populations within the Study Area. These measures may include gathering seed from impacted populations for planting within nearby appropriate habitat, preserving or enhancing existing offsite populations of the plant species affected by the Project, or restoring suitable habitat for special-status plant species habitat as directed by the regulatory agencies.

5.1.2 Burrowing Owl

The annual grassland within the Study Area contains herbaceous habitat and some small mammal burrows that are potentially suitable nesting habitat for burrowing owl, although no burrowing owls were observed during the field survey.

Avoidance and Minimization Measures

Since there are no known populations of these species, direct avoidance during design is not feasible. However, avoiding or minimizing the loss of annual grassland habitat will reduce the potential for the project to impact burrowing owl.

Prior to the start of construction, protocol surveys for the presence of burrowing owl should be conducted by a qualified biologist in accordance with the CDFW 2012 Staff Report. If burrowing owls are observed on or within 500 feet of proposed development activities that will result in ground disturbance, then an impact assessment should be prepared and submitted to the CDFW, in accordance with the CDFW 2012 Staff Report. If it is determined that project activities may result in impacts to occupied western burrowing owl habitat, then the project proponent should consult with CDFW and develop a detailed mitigation plan establishing avoidance and mitigation measures based on the requirements set forth in Appendix A of the CDFW 2012 Staff Report (CDFW 2012).

5.1.3 Swainson's Hawk Foraging Habitat and Nesting Habitat

The annual grassland within the Study Area provides suitable foraging habitat and the mature trees in the riparian and oak woodlands provide suitable nesting habitat for Swainson's hawk. The CDFW considers five or more vacant acres of suitable foraging habitat within ten miles of an active nest within

the last five years to be significant foraging habitat for Swainson's hawk, the conversion of which to urban uses is considered a significant impact (CDFW 1994; Staff Report). Although implementation of the trail project will retain the majority of the annual grassland habitat, loss of habitat may require mitigation.

Avoidance and Minimization Measures

Since there are no known occurrences of Swainson's hawk in the Study Area, direct avoidance during design is not feasible. However, avoiding or minimizing the removal of mature trees that could be used for nesting and the loss of annual grassland foraging habitat will reduce the potential for the project to impact Swainson's hawk.

Trees should be removed between September 16 and February 28, which is outside of the Swainson's hawk nesting season, if feasible.

Prior to the start of construction, protocol surveys for active Swainson's hawk nests should be conducted by a qualified biologist in accordance with the *Recommended Timing and Methodology for Swainson's Hawk Nesting Surveys in California's Central Valley* (Swainson's Hawk Technical Advisory Committee 2000). If no active Swainson's hawk nests are observed, then a letter report documenting the results of the survey should be provided to the City for their records, and no additional measures are recommended.

If active nests are observed on or within ¼-mile of the project site, then additional avoidance measures are recommended. CDFW should be consulted to determine to establish an appropriate noise buffer, develop take avoidance measures, and implement a monitoring and reporting program prior to any construction activities occurring within ¼-mile of the nest. A pre-construction WEAP training should be completed. Biological monitoring of the nest should be conducted until the young have fledged.

If the project impacts five or more acres of annual grassland habitat, mitigation for loss of this foraging habitat should implemented in accordance with the Staff Report. Foraging habitat losses on projects located greater than five miles but less than ten miles of an active nest tree documented within the last five years shall be mitigated at a 0.5:1 ratio.

5.1.4 Nesting Birds and Raptors

The various habitats within the Study Area provide potential nesting and foraging habitat for many raptor and other bird species. One white-tailed kite was observed foraging and two active nests were observed within Study Area during the field survey.

Avoidance and Minimization Measures

Although only two active nests were observed during the field survey, it is likely that additional nests will be established in the future. Avoidance and minimization measures during design include maintaining a 50-foot minimum setback from known active nests and minimizing impacts to oak woodland and riparian woodland habitats.

If feasible, then ground clearing activities and tree/shrub removal should be completed between September 1 and January 31, outside of the nesting season.

If construction begins during the nesting season (February 1 through August 31), then a pre-construction nesting bird survey shall be conducted within 14 days prior to the commencement of construction activities or vegetation removal. If the pre-construction survey results in no evidence of active nests, then a letter report should be submitted to the City for their records and no additional measures are recommended.

If active nests are found, additional avoidance measures are recommended. A pre-construction WEAP training should be completed. A qualified biologist should establish an appropriate species-specific buffer zone around the nests. The biologist shall mark the buffer zone with high visible flagging or pin flags and maintain the buffer zone until all construction has been completed, until the end of the breeding season, or until the young have successfully fledged and/or the nest is no longer active. The active nests should be monitored weekly during construction to evaluate potential nesting disturbance caused by construction activities.

If establishing the typical buffer zone is impractical, then the qualified biologist may reduce the buffer, depending on the species, and conduct daily monitoring to ensure that the nest is not disturbed and that no forced fledging occurs. Daily monitoring shall occur until the qualified biologist determines that the nest is no longer occupied or that it has been determined that nesting activity is not negatively affected by adjacent Project construction activities.

5.1.5 Pallid Bat

Pallid bat has the potential to roost in hollows within trees and the existing utility building and to forage within the Study Area.

Avoidance and Minimization Measures

The potential for impacts to pallid bat can be minimized during the design process by retaining dead trees or trees with hollows whenever possible.

A qualified biologist should conduct a pre-construction survey for the pallid bat within 14 days prior to the start of tree removal or grading operations. If no bat roosts are observed, then a letter report documenting the results of the survey should be provided to the City for their records, and no additional measures are recommended. If construction does not commence within 14 days of the pre-construction survey, or halts for more than 14 days, a new survey is recommended.

If pallid bat is found, additional avoidance measures are recommended. A pre-construction WEAP training should be completed. If pallid bats are roosting on or within 100 feet of the proposed project footprint, then the biologist should establish an appropriate buffer around the roost site prior to construction. At a minimum, no trees being used for roosts should be removed until the biologist has determined that bats are no longer roosting. Additional mitigation measures, such as installation of bat boxes or alternate roost structures, would be recommended only if bats are found to be roosting within the proposed project area and roosts were determined to be subject to removal during construction.

5.1.6 Western Pond Turtle

Kaseberg Creek provides aquatic habitat and the adjacent riparian and annual grassland provide upland habitat for this species.

Avoidance and Minimization Measures

The potential for impacts to western pond turtle can be minimized during the design process by avoiding or minimizing impacts to Kaseberg Creek and the surrounding upland areas within 500 feet of the channel, where this species is most likely to be found.

Prior to construction of any improvements in the Study Area, a qualified biologist should conduct a pre-construction survey within 14 days prior to the start of ground disturbance within 500 feet of riparian and creek habitat. If no western pond turtles are observed, then a letter report documenting the results of the survey should be provided to the City for their records, and no additional measures are recommended. If construction does not commence within 14 days of the pre-construction survey, or halts for more than 14 days, a new survey is recommended.

If western pond turtles are found, additional avoidance measures are recommended. A pre-construction WEAP training should be completed. A qualified biologist should conduct a pre-construction survey within 24 hours prior to commencement of construction activities within 500 feet of the perennial drainage and be present during grading activities in this area for the purpose of relocating any western pond turtles found within the construction footprint to suitable habitat away from the construction zone.

5.1.7 Western Spadefoot Toad

The annual grassland within the Study Area provides potential for upland aestivation habitat and the vernal pools and seasonal wetlands provide potential breeding habitat for western spadefoot toad.

Avoidance and Minimization Measures

The potential for impacts to western spadefoot toad can be minimized during the design process by avoiding or minimizing impacts to vernal pools and seasonal wetlands and the surrounding upland areas within 800 feet, where this species is most likely to be found.

A qualified biologist should conduct a pre-construction survey during the breeding season (February to March). This survey should include aquatic surveys of potential breeding ponds for egg masses and terrestrial surveys of surrounding uplands within 800 feet. If no western spadefoot toads are observed, then a letter report documenting the results of the survey should be provided to the City for their records, and no additional measures are recommended.

If western spadefoot toads are found, then additional avoidance measures are recommended. A pre-construction WEAP training should be completed. A qualified biologist should conduct a pre-construction survey within 24 hours prior to commencement of construction activities within 800 feet of vernal pools and seasonal wetlands and be present during grading activities in this area for the purpose of relocating any western spadefoot toad found within the construction footprint to suitable habitat away from the construction zone.

5.1.8 Vernal Pool Invertebrates

California linderiella, Ricksecker's water scavenger beetle, vernal pool fairy shrimp, and vernal pool tadpole shrimp have the potential to occur in the vernal pools within the Study Area. As noted by USFW, indirect effects on avoided vernal pools can occur as a result of adjacent ground disturbing activities

within a 250-foot radius of avoided vernal pools, specifically, activities and/or structures that adversely affect water quality or alter the hydrology.

Avoidance and Minimization Measures

Design of the trail and other improvements should avoid direct impacts to vernal pools, minimize changes to vernal pool watersheds, and maximize setbacks to vernal pools to the greatest extent feasible. Improvements should be designed to avoid directing runoff into pools.

If the proposed trail or other improvements will be located within 250 feet of a vernal pool, consult with USFWS to determine potential project impacts and appropriate mitigation and protection measures. At a minimum, implement erosion control and water quality best practices to prevent runoff from construction site into vernal pools.

5.1.9 Valley Elderberry Longhorn Beetle

Although no elderberry shrubs were observed during the field survey, a section of riparian habitat located adjacent to Bear Dog Park, in the northeastern portion of the Study Area was not fully accessible due thick undergrowth. Therefore, elderberry shrubs could be present and may provide suitable habitat for valley elderberry longhorn beetle.

Avoidance and Minimization Measures

If an elderberry shrub is located and construction is anticipated within 165 feet of the elderberry shrubs, approval by the USFWS must be obtained and a minimum setback of 20 feet from the driplines of the elderberry shrubs must be maintained, in accordance with the U*SFWS Valley Elderberry Longhorn Beetle (Desmocerus californicus dimorphus)* (Framework) (USFWS 2017).

Project activities that will encroach into the 20-foot minimum setback area are assumed to adversely affect valley elderberry longhorn beetle. Project activities that may directly or indirectly affect elderberry shrubs with stems measuring at least one inch, require minimization measures including planting replacement habitat or purchasing mitigation credits from a USFWS-approved mitigation bank. The mitigation ratios vary based on whether exit holes are present and whether the shrubs occur within riparian habitat

5.1.10 Andrenid Bee

The annual grassland and oak woodland within the Study Area contains potentially suitable habitat for Andrenid bee, although no Andrenid bee were observed during the field survey. Since andrenid bee establishes new nests annually, the potential loss of individual nests is not expected to have a significant impact on this species.

Avoidance and Minimization Measures

Since there are no known populations of these species, direct avoidance during design is not feasible. However, avoiding or minimizing the loss of annual grassland habitat and oak woodland habitat will reduce the potential for the project to impact Andrenid bee.

No species-specific mitigation pre-construction measures are recommended for this species.

5.2 FUTURE PERMITS AND ENVIRONMENTAL COMPLIANCE

Additional environmental review and permitting may be required prior to the start of construction.

5.2.1 Environmental Review

Prior to construction, the City must complete a review of the project for compliance with state environmental regulations. If Federal funding is obtained for the project then a NEPA review may also be required. As part of the preparation of these documents additional technical studies may be required.

5.2.2 Regulatory Permits

Prior to initiation of any construction activities which could result in impacts to potentially regulated aquatic features, permits for these impacts under Section 404 and 401 of the CWA and the State Water Code will be required. As part of the permitting process, a formal aquatic resources delineation should be completed and submitted to the USACE for verification of the extent of regulated aquatic features. Any conditions included in the final permits, including prescribed mitigation measures, would be required to be implemented prior to filling or impacting these features.

If aquatic features are determined not to be subject to regulation under the CWA, then these features may still be considered waters of the State. An application for discharge of dredge or fill material should be submitted to the RWQCB prior to the start of construction.

Impacts to the bed and bank or riparian vegetation of any creek or seasonal drainage may require a streambed alteration agreement. An application for a SAA should be submitted to CDFW, which will review it and determine if an SAA is required.

5.2.3 Protected Trees

As outlined under City's Municipal Code Section 19.66.60, *Standard Policies and Procedures for Approved Work*, the following measures define procedures necessary to safeguard the health of protected trees to be preserved onsite or which may be impacted as a result of construction activities (City of Roseville 2020a).

- A minimum five-foot high chain link or substitute fence approved by the City Planning Manager ("Manager") shall be installed at the outermost edge of the protected zone ("TPZ") of each protected tree or groups of protected trees. Exceptions to this policy may occur in cases where protected trees are located on slopes that will not be graded. However, approval must be obtained from the City's Planning Division ("Planning Division") to omit fences in any area of the project.

- Tree protection fencing shall be installed in accordance with the approved fencing plan prior to the commencement of any grading operations or such other time as determined by the review body. The developer shall call the Planning Division for an inspection of the fencing prior to grading operations. Upon approval, the fences shall remain in place throughout the entire construction period and shall not be removed, relocated, taken down, or otherwise modified in whole or in part without prior written authorization from the Planning Division.

- Signs shall be installed along the tree protection fencing in four equidistant locations around each individual protected tree, or at 50-foot intervals along the fencing surrounding a grove of protected trees. The size of each sign must be a minimum of two feet by two feet and must contain the following language:

  "WARNING, THIS FENCE SHALL NOT BE REMOVED OR
  RELOCATED WITHOUT WRITTEN AUTHORIZATION FROM THE
  CITY OF ROSEVILLE PLANNING DIVISION."

- To ensure the preservation of protected trees during construction, a minimum $10,000.00 deposit (or greater, if deemed necessary by the Approving Authority) shall be posted and maintained. The deposit shall be posted in a form approved by the City Attorney prior to any grading, delivery of materials, or movement of heavy equipment onto the site, or issuance of any permits. Each violation of any Tree Permit condition regarding tree preservation shall result in forfeiture of a portion or the entirety of the deposit, at the discretion of the Approving Authority, provided that such determinations may be appealed (City of Roseville 2020b).

- Where a Tree Permit has been approved for construction of a retaining wall(s) within the protected zone of a protected tree, the developer will be required to provide for immediate protection of exposed roots from moisture loss during the time prior to completion of the wall. The retaining wall shall be constructed within 72 hours after completion of grading.

- Pruning of living roots of less than one-inch diameter (minor roots) may be cut, but damaged roots shall be traced back and cleanly cut behind any split, cracked or damaged area. Pruning of living roots over one-inch in diameter (major roots) may not be cut without approval of an ISA-Certified Arborist. Cut all roots cleanly at the edge of the trench. Do not tear or pull roots out of ground. If roots are split during excavation, follow root back to immediately above split and cut cleanly.

- If required, preservation devices such as aeration systems, oak tree wells, drains, special foundation systems, special paving and cabling systems must be installed per approved plans and certified by the project arborist.

- Every effort should be made to avoid cut and/or fill slopes within or in the vicinity of the protected zone of any protected tree. No grade changes are permitted which would cause water to drain to the area within twice the longest radius of the protected zone of any protected tree or would result in the ground being lowered on all sides of the tree.

- When permitted, trenching within the protected zone of a protected tree may only be conducted with hand tools or as otherwise directed by an arborist, in order to avoid root injury.

- A certification letter should be submitted by the project arborist to the Planning Division within five working days of completing any regulated activity within the protected zone of protected trees, attesting that all work was conducted in accordance with the appropriate permits and the requirements of this chapter.

- All conditions of approval should be adhered to as outlined under the project's Tree Permit obtained from the City.

The following measures are general best management practices (BMPs) that are recommended to minimize the potential for injury or damage to occur to trees to be preserved onsite.

- No parking, portable toilets, dumping or storage of any construction materials, including oil, gas, or other chemicals, or other infringement by workers or domesticated animals is allowed in the TPZ;

- Minimize disturbance to the native ground surface (grass, leaf, litter, or mulch) under preserved trees to the greatest extent feasible. All brush, earth, and debris that is required to be removed within the dripline of a preserved tree should be conducted in a manner that prevents injury to the tree;

- All pruning should be done in accordance with ISA American National Standards Institute (ANSI) tree care standards using tree maintenance best practices;

- Climbing spikes should not be used on living trees;

- All exposed roots should be covered with protective material (e.g., damp burlap) during construction to prevent drying out;

- No signs, ropes, cables, or any other item should be attached to a tree; and

- No burning or use of equipment with an open flame should occur near or within the TPZ. Appropriate fire prevention techniques should be employed around all trees to be preserved. This includes prohibiting the use of tools that may cause sparks, such as metal blade trimmers or mowers.

Regionally Occurring Listed and Special-Status Species

This page intentionally left blank

Appendix A
Regionally Occurring Listed and Special-Status Species

Table 1 — Legally Protected Species

Special-Status Species	Regulatory Status	Habitat Requirements	Identification/ Survey Period	Potential for Occurrence
Plants				
Boggs Lake hedge-hyssop *Gratiola heterosepala*	--; CE; --; 1B	Annual herb found on clay soils in vernal pools and swamps, occasionally along lake margins, from 10 to 2,375 meters.	Blooming period: April – August	**High.** The Study contain suitable vernal pool habitat for this species. There are three CNDDB records for this species within five miles of the Study Area (CDFW 2020).
Invertebrates				
Valley elderberry longhorn beetle *Desmocerus californicus dimorphus*	FT; --; --; --	Associated with elderberry shrubs (*Sambucus* sp.) often within riparian habitats. Presence can be indicated by bore-holes in stems of elderberries.	March – June (Adults) Year – round (Larvae)	**Low.** Elderberry shrubs were not noted during the site survey however, sections of the riparian habitat west of Bear Dog Park and North of Kaseberg Creek were not accessible due to dense thorny brush. Therefore, elderberry shrubs have the potential to occur within this section of the Study Area.
Vernal pool fairy shrimp *Branchinecta lynchi*	FT; --; --; --	Inhabits vernal pools, swales, and ephemeral freshwater habitat. Known from Alameda, Butte, Calaveras, Colusa, Contra Costa, El Dorado, Fresno, Glenn, Kings, Madera, Merced, Monterey, Napa, Placer, Riverside, Sacramento, San Benito, San Joaquin, San Luis Obispo, Santa Barbara, Shasta, Solano, Stanislaus, Sutter, Tehama, Tulare, Tuolumne, Ventura, Yolo, and Yuba counties.	USFWS protocol-level wet-season sampling and/or dry season cyst identification	**High.** The Study contain suitable vernal pool habitat for this species. There are 26 CNDDB records for this species within five miles of the Study Area (CDFW 2020).
Conservancy fairy shrimp *Branchinecta conservatio*	FE; --; --; --	Inhabits vernal pools, swales, and ephemeral freshwater habitat. Known from Butte, Tehama, Glenn, Yolo, Solano, Stanislaus, Merced, and Ventura counties.	USFWS protocol-level wet-season sampling and/or dry season cyst identification	**None.** Although the Study Areas contains vernal pool habitat, the Study is outside of the known geographical range of this species.
Vernal pool tadpole shrimp *Lepidurus packardi*	FE; --; --; --	Inhabits vernal pools, swales, and ephemeral freshwater habitat. Known from Alameda, Butte, Colusa, Contra Costa, Fresno, Glenn, Kings, Merced, Placer, Fresno, San Joaquin, Shasta, Solano, Stanislaus, Sutter, Tehama, Tulare, Yolo, and Yuba counties.	USFWS protocol-level wet-season sampling and/or dry season cyst identification.	**High.** The Study Area contains suitable vernal pool and ephemeral freshwater habitat for this species. There is one CNDDB record for this species within five miles of the Study Area (CDFW 2020).
Fish				
Delta smelt *Hypomesus transpacificus*	FT; CE; --; --	Found in open waters of bays, tidal rivers, channels, and sloughs.	Year – Round	**None.** The Study Area does not contain suitable habitat to support this species (i.e., open waters of bays, tidal rivers, channels, and sloughs).
Chinook salmon-Central Valley spring-run *Oncorhynchus tshawytscha*	FT; CT; --; --	Found in the ocean, rivers, creeks, and large inland lakes.	Year-round	**None.** The Study Area does not contain suitable habitat to support this species. Although Kaseberg Creek transects a portion of the Study Area, this creek hydrology does not provide enough flow to support this large fish species
Longfin smelt *Spirinchus thaleichthys*	FC; CT; --; --	Inhabits estuaries and bays in the Delta and Sacramento-San Joaquin Rivers. Migrate to freshwater to spawn.	(November) December – February (June)	**None.** The Study Area does not contain suitable habitat for this species (i.e., estuaries and bays in the Delta).
Steelhead - Central Valley DPS *Oncorhynchus mykiss irideus*	FT; --; --; --	Found in the ocean, rivers, creeks, and large inland lakes. This distinct population only occurs in the Sacramento and San Joaquin Rivers and their tributaries.	Year – Round	**None.** This species is confined to the uppermost portions of the watershed (e.g. Miners and Secret Ravine) for rearing due to the consistently cooler summer temperatures (GANDA 1998) There is one CNDDB record for this species within five miles of the Study Area (CDFW 2020).
Amphibians/Reptiles				
California red-legged frog *Rana draytonii*	FT; CSC; --; --	Found near quiet, permanent pools of streams, marshes, and ponds with extensive vegetation below 1200 meters. Typically occurs in humid forests, woodlands, grassland, and foothill habitats. Adults may disperse considerable distances between pools during rain events. Breeds in permanent pools from January through July.	Year – Round	**None.** This species is generally considered extirpated from the valley.

Appendix A (cont.)
Regionally Occurring Listed and Special-Status Species

Special-Status Species	Regulatory Status	Habitat Requirements	Identification/ Survey Period	Potential for Occurrence
California tiger salamander Central Population *Ambystoma californiense*	FT; CT--; --	Breeds in vernal pools and seasonal ponds in grasslands and oak savannas. Adults spend summer in small mammal burrows.	Drift fence studies during fall and winter for upland habitats. November – February (adults) March 15 – May 15 (larvae)	**None.** The Study Area is not within the known range of the species.
Giant garter snake *Thamnophis gigas*	FT; CT--; --	Found in agricultural wetlands and other wetlands such as irrigation and drainage canals, low gradient streams, marshes, ponds, sloughs, small lakes, and their associated uplands in Sacramento, Sutter, Butte, Colusa, and Glenn counties.	Active outside of dormancy period November-mid March	**None.** The Study Area is outside of the current known range of the species.
Birds				
Bald eagle *Haliaeetus leucocephalus*	FD; CE; --; --	Breeding habitat most commonly includes areas within 2.5 miles (4.0 kilometers) of coastal areas, bays, rivers, lakes, and reservoirs. Nests usually are in tall trees or on pinnacles or cliffs near water.	Year round	**None.** The Study Area does not contain suitable habitat for this species (i.e., within 2.5 miles (4.0 kilometers of coastal areas, bays, rivers, lakes, and reservoirs).
Bank swallow *Riparia riparia*	--; CT; --; -- Nesting	Colonial breeder found in open and partly open situations, frequently near flowing water. Nests on steep sand, dirt, or gravel banks, in burrows dug near the top of the bank, along the edge of inland water, or along the coast, or in gravel pits or road embankments.	February – October	**None.** The Study Area does not provide suitable habitat for this species**.** The banks of the creek are not steep and gravel riparap is adjacent to busy roadways.
California black rail *Laterallus jamaicensis coturniculus*	--; CT; --; --	Saltwater, brackish, and freshwater marshes. Does not occur in wetland areas with annual fluctuations in water level and need a permanent water source of at least 1 inch in depth.	Year – round	**None.** Although the Study Area contains wetland, there is seasonal fluctuation in the hydrology with no permanent water and no marsh habitat is present.
Golden eagle *Aquila chrysaetos*	--; CFP; --; --	Open and semi-open areas in the mountains up to 12,000 feet in elevation. They are also found in canyon lands, rimrock, terrain, and riverside cliffs and bluffs. Nest are built on cliffs and steep escarpments in grassland, in trees, chaparral, shrubland, forests and man-made structures within vegetated areas.	Year -round	**None.** The Study Area does not contain suitable habitat for this species. The Study Area is relatively flat lacking the steep cliff and bluff habitat for nesting this species is generally associated with.
Swainson's hawk *Buteo swainsoni*	--; CT; --; --	Nest peripherally in valley riparian systems, lone trees or groves of trees in agricultural fields. Valley oak, Fremont cottonwood, walnut, and large willow trees, ranging in height from 41 to 82 feet, are the most commonly used nest trees in the Central Valley.	Breeding: March – October	**High.** The Study Area provides suitable nesting habitat within the riparian and oak woodland. The annual grassland provides foraging habitat for this species as numerous rodent burrows were observed during the March 2020 site survey. There are seven CNDDB record for this species within five miles of the Study Area (CDFW 2020).
Tricolored blackbird *Agelaius tricolor*	--; CCE; CSA; --	Nests in colonies near fresh water, usually within emergent wetland habitat with tall, dense cattails, tule, willow, blackberry, wild rose, and other marshy vegetation. Forages in open grassland, wetland, and agricultural habitats.	Year – Round	**Low.** Nesting habitat for this species is limited within the Study Area to small patches within the riparian and creek habitat. Suitable foraging habitat exists for this species within the annual grassland community. There is one CNDDB records for this species within five miles of the Study Area (CDFW 2020).
Western yellow-billed cuckoo *Coccyzus americanus occidentalis*	FT; CE; --; --	Found in woodlands, thickets, orchards, and streamside groves. Breeds mostly in dense deciduous stands, including forest edges, tall thickets, dense second growth, overgrown orchards, and scrubby oak woodlands. Often found in willow groves around marshes. In the west, mostly in streamside trees, including cottonwood-willow groves in arid country.	Late Spring – Early Fall (Breeding)	**None.** Although the Study Area contains some riparian habitat, this species requires large blocks of riparian habitat for nesting. Along the Sacramento River, nesting yellow-billed cuckoos occupied home ranges which included 25 acres (10 hectares) or more of riparian habitat. Another study on the same river found riparian patches with yellow-billed cuckoo pairs to average 99 acres (40 hectares). Home ranges in the South Fork of the Kern River averaged about 42 acres (17 hectares) (CDFW 2017).

Table 1 includes federal threatened or endangered species and eagles, and State threatened, endangered, or fully protected species.

Table 2 — Species Subject to CEQA Review

Special-Status Species	Regulatory Status	Habitat Requirements	Identification/ Survey Period	Potential for Occurrence
Plants				
Ahart's dwarf rush *Juncus leiospermus* var. *ahartii*	--; --; --; 1B	Annual herb found in mesic areas in valley and foothill grasslands from 30 to 229 meters.	Blooming period: March – May	**High.** The Study Area provides suitable habitat for this species within the vernal pool habitat.
Dwarf downingia *Downingia pusilla*	--; --; --; 2B	An annual herb found in mesic areas within valley and foothill grassland and vernal pool habitats from 1 to 445 meters.	Blooming period: March – May	**High.** The Study Area contains suitable vernal pool and grassland habitat for this species. There are sixteen CNDDB records for this species within five miles of the Study Area (CDFW 2020F).
Hispid bird's-beak *Chloropyron mole* ssp. *hispidum*	--; --; --; 1B	Annual hemiparasite herb found on alkaline soil in meadows and seeps, playas, valley and foothill grasslands, from 1-155 meters.	Blooming period: June – September	**None.** The Study Area does not provide suitable habitat for this species (I.e., alkaline soils in meadows and seeps, playas).
Legenere *Legenere limosa*	--; --; --; 1B	Annual herb found in vernal pools from 1 to 880 meters.	Blooming period: April – June.	**High.** The Study Area contains suitable vernal pool habitat for this species. There are three CNDDB records for this species within five miles of the Study Area (CDFW 2020).
Pincushion navarretia *Navarretia myersii* ssp. *myersii*	--; --; --; 1B	Annual herb often found in acidic soils within vernal pools from 20 to 330 meters.	Blooming period: April – May	**Low.** Although the Study Areas contains vernal pools, the soils may not be the adequate pH for this species to thrive.
Red Bluff dwarf rush *Juncus leiospermus*	--; --; --; 1B	Annual herb in vernally moist chaparral, cismontane woodlands, meadows and seeps, valley and foothill grasslands, and vernal pools from 35-1,250 meters.	Blooming period: March – June	**High.** The Study Area contains suitable vernal pool and annual grassland habitat for this species. There is one CNDDB record for this species within five miles of the Study Area (CDFW 2020).
Sanford's arrowhead *Sagittaria sanfordii*	--; --; --; 1B	Perennial rhizomatous herb found in assorted shallow freshwater wetlands, marshes, and swamps from 0 to 650 meters.	Blooming period: May – October	**High**. The seasonal wetlands within the Study Area provide suitable habitat for this species. There are three CNDDB records for this species within five miles of the Study Area (CDFW 2020).
Wolly rosemallow *Hibiscus lasiocarpos var. occidentalis*	--; --; --; 1B	Perennial rhizomatous herb often found on the sides of levees within freshwater marshes and swamps from 0 to 120 meters.	Blooming period: June-September	**None.** The Study Area does not provide suitable habitat for this species.
Invertebrates				
California linderiella *Linderiella occidentalis*	--; CSA; --; --	Found in most landforms, geologic formations and soil types supporting vernal pools in California. They are typically found in deeper vernal pools throughout elevations ranging from 10 to 1,159 meters.	USFWS protocol-level wet-season sampling and/or dry season cyst identification.	**High.** The Study Area contains suitable vernal pool habitat for this species. There are twenty-two CNDDB records for this species within five miles of the Study Area (CDFW 2020).
Fish				
Sacramento splittail *Pogonichthys macrolepidotus*	--; CSC; --; --	Inhabits the streams and tributaries of the Sacramento-San Joaquin Rivers in estuaries, marshes, and freshwater.	Spawns in spring (sometimes in winter and early summer).	**None.** The Study Area is not within the known watersheds this species inhabits.
Amphibians/Reptiles				
Western pond turtle Emys marmorata	--; CSA; --; --	Occurs in a variety of aquatic habitats such as ponds, creeks, ditches, lakes, and marshes. Prefers areas with abundant vegetation and rocky or muddy substrate. Exposed banks or other basking areas such as logs or cattail mats are required. Upland habitat typically occurs within woodlands, forests, or grasslands, within the vicinity of aquatic habitat.	Year – Round	**High.** The Study Area provides suitable aquatic and upland habitat for this species in the riparian and creek habitats.
Western spadefoot *Spea hammondii*	--; CSC; --; --	Found in a variety of upland habitats, including lowlands, foothills, grasslands, open chaparral, and pine-oak woodlands. Habitat preferences include shortgrass plains, and sandy or gravelly soils for burrowing (e.g., alkali flats, washes, alluvial fans). Hibernates/aestivates for most of the year underground. During the breeding season are found in temporary rain pools, and slow-moving streams (e.g., areas flooded by intermittent streams).	Breeding: January – May	**High.** The annual grassland and vernal pools located throughout the Study Area provided suitable habitat for this species. Numerous suitable burrows were noted during the 2020 survey. There are five CNDDB record for this species within five miles of the Study Area (CDFW 2020).

Appendix A (cont.)
Regionally Occurring Listed and Special-Status Species

Special-Status Species	Regulatory Status	Habitat Requirements	Identification/ Survey Period	Potential for Occurrence
Birds				
Black-crowned night heron *Nycticorax nycticorax*	--; CSA; --; --	Found in saltwater, brackish and freshwater habitats that include marshes, swamps, wooded streams, mangroves, lake shores, ponds, and lagoons. Roosting occurs in mangrove forests or swampy woodlands. Nesting occurs in trees near coastal marshes or on marine islands, swamps, marsh vegetation, clumps of grass on the dry ground, orchards, etc. Nesting usually occurs with other heron species.	Winter (Non-breeding)	**Low**. Wetlands, vernal pools and riparian habitat located within the Study Area provide foraging habitat for this species. However, no rookeries were observed.
Burrowing owl *Athene cunicularia*	--; CSC; --; -- (burrowing sites and some wintering sites)	Nests in burrows in the ground, often in old ground squirrel burrows or badger, within open dry grassland and desert habitat. The burrows are found in dry, level, open terrain, including prairie, plains, desert, and grassland with low height vegetation for foraging and available perches, such as fences, utility poles, posts, or raised rodent mounds.	Year – round	**High.** The annual grassland located throughout the Study Area provides suitable habitat for this species. Numerous suitable burrows were noted during the 2020 survey. There is one CNDDB record for this species within five miles of the Study Area (CDFW 2020).
California thrasher *Toxostoma redivivum*	--; CSC; --; --	Found in chaparral within shrubs and small trees and woodlands if ample underbrush is present. This species is only in California and a small part of Baja California.	Year-Round	**None.** The Study Area does not provide suitable habitat for this species (i.e., chaparral).
Common Yellowthroat *Geothlypis trichas*	BCC; --; --; --	Found in open habitats such as marshes, wetland edges, and brushy fields. they are also found in dry upland pine forests, palmetto thickets, drainage ditches, hedgerows, orchards, fields, burned-over oak forests, shrub-covered hillsides, river edges, and disturbed sites. They winter in similar habitats with dense vegetation in the southern United States, Mexico, Central America, and the Caribbean.	Year Round	**High.** The Study Area provides suitable foraging and nesting habitat for this species within the annual grassland, oak woodland, and riparian habitats.
Grasshopper sparrow *Ammodramus savannarum*	--; CSC; --; --	Frequents dense, dry, or well drained grassland, especially native grassland. Nests at base of overhanging clump of grass. This species is known from Los Angeles, Mendocino, Orange, Placer, Sacramento, San Diego, San Luis Obispo, Solano, and Yuba counties, in California.	April – July (breeding)	**Low.** Although portions of the Study Area contain annual grasslands that provide habitat for this species, the Study Area shows signs of recent grazing, thus reducing vegetation density that the species requires for nesting.
Great blue heron *Ardea herodias*	--; CSA; --; --	Inhabits both freshwater and saltwater habitats and forages in grassland and agricultural field. Breeding colonies are located within 2 to 4 miles of feeding areas, often in isolated swamps or on islands, and near lakes and ponds bordered by forests.	Year – round	**Present.** This species was observed feeding in Kaseberg Creek within the Study Area during the March 2020 site visit. Wetlands, vernal pools and riparian habitat located within the Study Area provide foraging habitat for this species. However, no rookeries were observed.
Great egret *Ardea alba*	--; CSA; --; --	Found in marshes, swampy woods, tidal estuaries, lagoons, mangroves, streams, lakes, ponds, fields and meadows. Nests primarily in tall trees, or in woods or thickets near water.	Year – round	**Present.** This species was observed feeding in a seasonal wetland within the Study Area during the March 2020 site visit. Wetlands, vernal pools and riparian habitat located within the Study Area provide foraging habitat for this species. However, no rookeries were observed.
Lewis' woodpecker *Melanerpes lewis*	BCC; --; --; --	Found in open forest and woodland, often logged or burned, including oak, coniferous forest (primarily ponderosa pine), riparian woodland (dominated by cottonwood), orchards, and less commonly in pinyon-juniper habitat. In winter uses oak woodlands, nut and fruit orchards. Nests in natural tree cavities, abandoned northern flicker holes or previously used cavities.	Year Round	**None.** This species inhibits transitional habitats between oak and coniferous forests at higher elevations than the Study Area.
Long-billed curlew *Numenius americanus*	BCC; --; --; --	Nests in low-growing vegetation (4-8" high), including shortgrass and mixed grass prairies and agricultural fields. In the winter, they migrate to the coast where they inhabit wetlands, tidal estuaries, mudflats, flooded fields, and occasionally beaches.	Summer (breeding)	**Low.** Although portions of the Study Area contain annual grasslands that provide habitat for this species, the Study Area shows signs of recent grazing, thus reducing vegetation high that the species requires for nesting.

Appendix A (cont.)
Regionally Occurring Listed and Special-Status Species

Special-Status Species	Regulatory Status	Habitat Requirements	Identification/ Survey Period	Potential for Occurrence
Nuttall's woodpecker *Picoides nuttallii*	BCC; --; --; --	Found primarily in oak woodlands and in riparian woods; rarely in conifer.	Year Round	**High**. The oak woodland and riparian habitat provide suitable foraging and nesting habitat for this species.
Oak titmouse *Baeolophus inornatus*	BCC; --; --; --	Found in oak and pine-oak woodland, arborescent chaparral, and oak-riparian associations. Nests are constructed in natural tree cavities, in woodpecker holes or bird boxes approximately 1 to 11 meters above ground.	Year Round	**High.** The oak woodland and riparian habitat provide suitable foraging and nesting habitat for this species.
Purple martin *Progne subis*	--; CSC; --; --	Nests in wide variety of open and partly open habitats that are often near water or around towns. Nests in tree cavities, abandoned woodpecker holes, crevices in rocks, and sometimes in bird houses or gourds put up by humans.	Summer (breeding)	**High**. The Study Area provides suitable nesting and foraging habitat for this species within the annual grassland, riparian and oak woodland habitat. There is one CNDDB occurrence documented within five miles of the Study Area (CDFW 2020).
Short-billed dowitcher *Limnodromus griseus*	BCC; --; --; --	Found in small lakes, and in manmade environments such as impoundments, sewage ponds, and flooded farm fields as well as in muddy margins of rivers, lakes, and bays. Migrants also rest on rocky and sandy shorelines and occasionally feed in such places, but they forage mostly where there is a fine muddy bottom covered by a few inches of water.	Year Round	**None.** The Study Area does not provide habitat for this species.
Song sparrow ("Modesto" population) *Melospiza melodia*	--; CSC; --; --	Found in thickets, brush, marshes, roadsides, gardens. Habitat varies over its wide range. In most areas, found in brushy fields, stream sides, shrubby marsh edges, woodland edges, hedgerows, well-vegetated gardens. Some coastal populations live in salt marshes. Nests in dense streamside brush in southwestern deserts, and in any kind of dense low cover on Aleutian Islands, Alaska.	Year – round	**High**. The Study Area provides suitable nesting and foraging habitat for this species within the annual grassland, riparian and oak woodland habitat.
White-tailed kite *Elanus leucurus*	--; CFP; --; -- (nesting)	Inhabits savanna, open woodlands, marshes, desert grassland, partially cleared lands and cultivated fields. Nests in trees, often near a marsh in savanna, open woodland, partially cleared lands, and cultivated fields. Foraging occurs within ungrazed or lightly grazed fields and pastures.	Year – round	**Present.** This species was observed in the riparian habitat and foraging in the annual grassland during the 2020 site assessment. The Study Area provides suitable foraging habitat within the annual grassland and nesting habitat for this species within the existing trees located in the oak woodland and riparian habitat. There are eight CNDDB occurrence for this species within five miles of the Study Area (CDFW 2020).
Yellow-billed magpie *Pica nuttalli*	BCC; --; --; --	Found in open oak woodland and oak savannas. Forages and nests in agricultural areas and pastures that feature tall trees (average 47 feet) in large tress often in clumps of mistletoe.	Year Round	**High.** The Study Area provides suitable foraging and nesting habitat for this species within the annual grassland, oak woodland, and riparian habitats.
Mammals				
Pallid bat *Antrozous pallidus*	--; CSC; --; --	Found in grasslands, shrublands, woodlands, and forests from sea level up through mixed conifer forest habitats. Roosts in colonies usually in rock crevices, caves, mines, hollow trees, and buildings.	March – October	**Low.** The Study Area provides suitable roosting habitat for this species within the mixed oak woodland however, the Study Areas lacks caves or mines that this species often utilizes.

Table 2 includes state and federal species of concern and Rank 1 and 2 CNPS species.

Table 3 — Other Species of Interest

Special-Status Species	Regulatory Status	Habitat Requirements	Identification/ Survey Period	Potential for Occurrence
Plants				
Adobe navarretia *Navarretia nigelliformis*	--; --; --; 4.2	Annual herb found on clay and sometimes serpentinite soils in foothill grasslands and sometimes in vernal pools from 100 to 1,000 meters.	Blooming period: April-June	**None.** Although the Study Area contains vernal pools, the Study Area is outside the known elevation range of this species.
Parry's rough tarplant *Centromadia parryi ssp.* rudis	--; --; --; 4.2	Annual herb found in alkaline soil, in vernally mesic, seeps, sometimes roadsides, in valley and foothill grasslands, vernal pools, from 0 to 100 meters.	Blooming period: May – October	**None.** The Study Area does not contain suitable habitat (i.e., alkaline soil) to support this species.
Stinkbells *Fritillaria agrestis*	--; --; --; 4.2	Perennial bulbiferous herb found in clay soils, sometimes in serpentinite, chaparral, cismontane woodland, pinyon and juniper woodland, and valley and foothill grassland from 10 to 1,555 meters.	Blooming period: March – June	**High.** The Study Area provides suitable habitat for this species within the annual grassland. There is one CNDDB record for this species within five miles of the Study Area (CDFW 2020).
Valley brodiaea *Brodiaea rosea* ssp. *vallicola*	--; --; --; 4.2	Perennial bulbiferous herb found in old alluvial terraces on silty, sandy, or gravelly loam soils within swales of valley and foothill grassland and vernal pools.	Blooming period: April – May (June)	**High**. The Study Area provides suitable habitat for this species within the annual grassland and vernal pool habitats located throughout the Study Area. Although there are no CNDDB records within 5 miles of the Study Areas, there are two occurrences within 15 miles to the north and west of the Study Area.
Invertebrates				
Antioch Dunes anthicid beetle *Anthicus antiochensis*	--; CSA; --; --	Found in interior sand dunes and sandbars that are either bare or contain little vegetation cover. Feeds on dead insects. Actively scavenges at night, burrowing into the sand and remaining inactive during the day. Adults overwinter, emerge in the spring to lay eggs from which the larvae hatch, and the next generation of adults emerges in early summer. Adults are most commonly collected in June and July (Davis 1991).	Spring-Summer	**None.** The Study Area does not contain suitable habitat (i.e., sand dunes) to support this species.
An andrenid bee *Andrena subapasta*	--; CSA; --; --	Found in grassland habitats within El Dorado, Placer, Sacramento, and San Joaquin counties. Ground nesters that will be underground from summer, fall and winter and emerge in early spring to forage and pollinate early bloomers, such as willows, maples, violets and other early blooming wildflowers.	Spring – Fall	**High**. The Study Area provides suitable habitat for this species within the ruderal habitat. There is one CNDDB record for this species within five miles of the Study Area (CDFW 2019).
Sacramento Valley tiger beetle *Cicindela hirticollis abrupta*	--; CSA; --; --	Typically found near aquatic environments. Their burrows are located in moist soils that are far enough away from water bodies to avoid being inundated with water. Most frequently found on the sandy shorelines of rivers, lakes, and oceans. (Pearson et al., 2006; Schlesinger and Novak 2011)	Spring-Fall	**None.** The Study Area does not contain suitable habitat (i.e., sandy shorelines of rivers, lakes, and oceans) to support this species.
Sacramento anthicid beetle *Anthicus sacramento*	--; CSA; --; -- (S1)	Found in loose sands along the Sacramento and San Joaquin rivers, from Shasta to San Joaquin counties, and at one site along the Feather River at Nicolaus. Adults overwinter, emerge in the spring to lay eggs from which the larvae hatch, and the next generation of adults emerge in early summer. The collection of larvae in the fall indicates a second generation may be produced. Adults are most commonly collected in June, July, and August (Davis 1991).	Year-Round	**None.** The Study Area does not contain suitable habitat (i.e., rivers) to support this species.
Ricksecker's water scavenger beetle *Hydrochara rickseckeri*	--; CSA; --; --	An endemic aquatic beetle known to occur in vernal pools that are inundated in winter and spring and dry during the summer months. Ideal habitat includes, neutral to slightly alkaline, clear, low dissolved salts, dominated with vernal pool plant species, and complex of vernal pool crustacean species. Known to occur in the Central Valley below 300 meters in elevation.	Year – round	**Low**. The Study Area provides suitable habitat for this species within the vernal pool habitats located throughout the Study Area. Although there are no CNDDB records within 5 miles of the Study Areas, the species is known to occur in the Central Valley below 300 meters in elevation.

Table 3 includes Rank 3 and 4 CNPS species and non-listed invertebrates, which may not be subject to CEQA review.

Appendix C

Summary of Regulatory Agency Coordination

This page intentionally left blank

Appendix C
Summary of Regulatory Agency Coordination

U.S. Fish and Wildlife Service

The design alternatives were reviewed with U.S. Fish and Wildlife Service (USFWS) staff on October 1, 2020. Since the concept of a trail through the Study Area was included in the OSPOMP, further consultation with the USFWS is not required unless a vernal pool is directly impacted. Since the vernal pools in the Study Area were preserved as part of previously permitted projects, any impacts to these features may require a higher than usual mitigation ratio so that the total mitigation incorporates this project and that required for the previous project. Consultation with the USFWS for impacts to vernal pools would be done through the Section 10 process by developing a small-project Habitat Conservation Plan. Consultation with the USFWS for impacts to VELB may be done through the Section 10 process or through Section 7 as part of a permit from the U.S. Army Corps of Engineers (USACE), depending on whether the impact to VELB is a result of impacts to federally jurisdictional waters (USFWS 2020).

U.S. Army Corps of Engineers (USACE)

Under the current Navigable Waters Protection Rule, which was adopted January 23, 2020 and went into effect June 22, 2020, the creeks and drainages and immediately adjacent wetlands may be considered waters of the U.S. and subject to federal jurisdiction. The vernal pool and seasonal wetland complexes may not be waters of the U.S. Although the USACE did review and approve the OSPOMP at a time when vernal pools were subject to federal jurisdiction, their interest in any future projects in the open space preserve will be limited to waters within their jurisdiction (USACE 2020). Any impacts to creek channels or other jurisdictional waters will require a permit under Section 404 of the Clean Water Act. Since these impacts are expected to be small, they are expected to qualify for a Nationwide permit.

California Department of Fish and Wildlife

The design alternatives were reviewed with California Department of Fish and Wildlife (CDFW) staff on September 30, 2020. If there are impacts to riparian areas and creeks, the standard Lake and Streambed Alteration Agreement (LSAA) application will be required. Additionally, if any state listed special-status species are identified in the Study Area prior to construction, CDFW should be consulted to determine appropriate avoidance measures or if an Incidental Take Permit (ITP) might be necessary (CDFW 2020).

Regional Water Quality Control Board

The Regional Water Quality Control Board (RWQCB) regulates impacts to waters of the state. Under the State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Water of the State, adopted on April 2, 2019 which went into effect on May 28, 2020, all surface waters in the Study Area, including vernal pools, seasonal wetlands, and drainages are considered waters of the state. An application will be required to be filed with the RWQCB prior to impacting any water of the state.

Summary of Second Survey Results

This page intentionally left blank

Introduction

The City of Roseville is studying the feasibility of developing a paved multi-use trail within Mahany Park open space which will ultimately connect with existing and proposed paved trails nearby. Part of the Mahany Park open space project area is a public park, but most of the area is considered an open space preserve. Currently, when visitors walk or bike through the area, they create dirt paths that can damage the endangered plants and wildlife within the open space preserve. The study will evaluate factors such as creeks, sensitive habitats and wildlife, topography, safety, aesthetics, and land use impacts. The open space has use limitations and trail suggestions will be considered within those constraints.

Map of the Mahany Park open space study area

In May 2020 as part of the feasibility study, the project team offered community members an initial opportunity to provide important input to help inform the feasibility study. Based upon technical analysis and community input from the online community survey, the project team developed several alternative trail alignments. From October 31 – November 13, 2020, the project team hosted a subsequent online community survey to understand community preferences for the draft western and eastern alignment options using a contextual map-based questionnaire. The survey featured three options for western trail segment and two options for the eastern segment. The project team received more than 320 responses from community members.

Methodology

The online community survey provided participants an opportunity to learn more about the feasibility study and provide their thoughts on the proposed trail alignments. The project team received 326 submissions from community members. A full list of the comments submitted is available in the Appendix.

To build awareness about the feasibility study and the online community survey, the project team in collaboration with the City's Public Information Officer, promoted the survey via the City's existing communication links (email, newsletters and social media). Promotional lawn signs with the URL address were also placed within the public right-of-way of the trail and neighboring community.

Based upon the following metrics, significant community awareness was created:

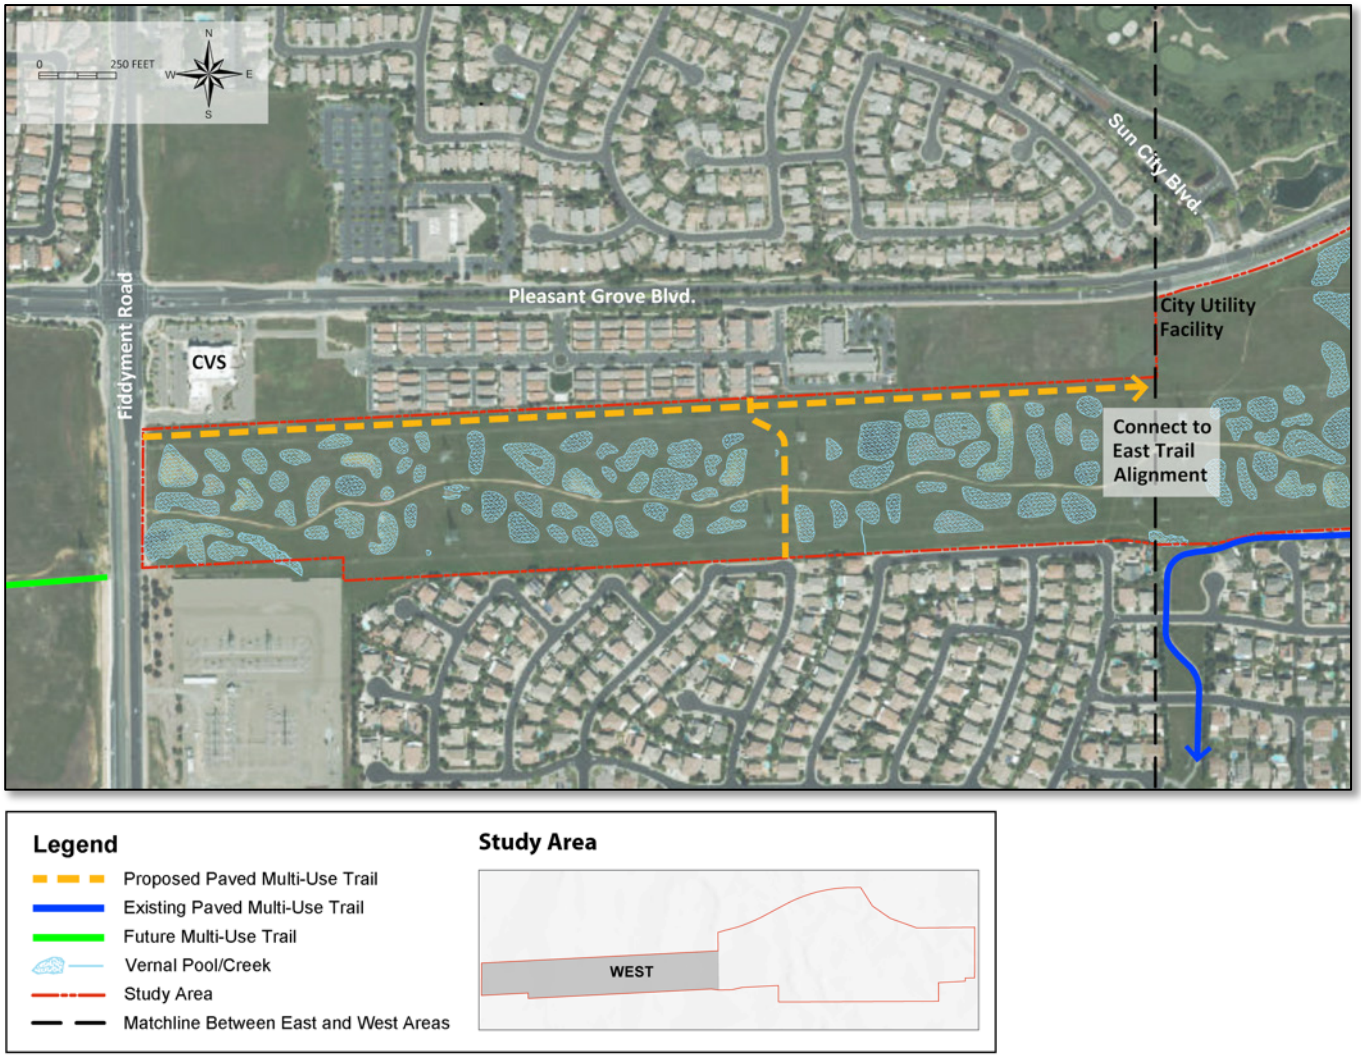
- More than 1,200 webpage impressions
- Instagram more than 2,500 impressions/Facebook more than 3,800 impressions
- Nextdoor more than 1,900 impressions
- Twitter more than 5,800 impressions

The online survey consisted of western and eastern alignments maps and a series of questions asking participants to rank their favorite alignment.

Western Trail Alignment Preference: **West Option A**

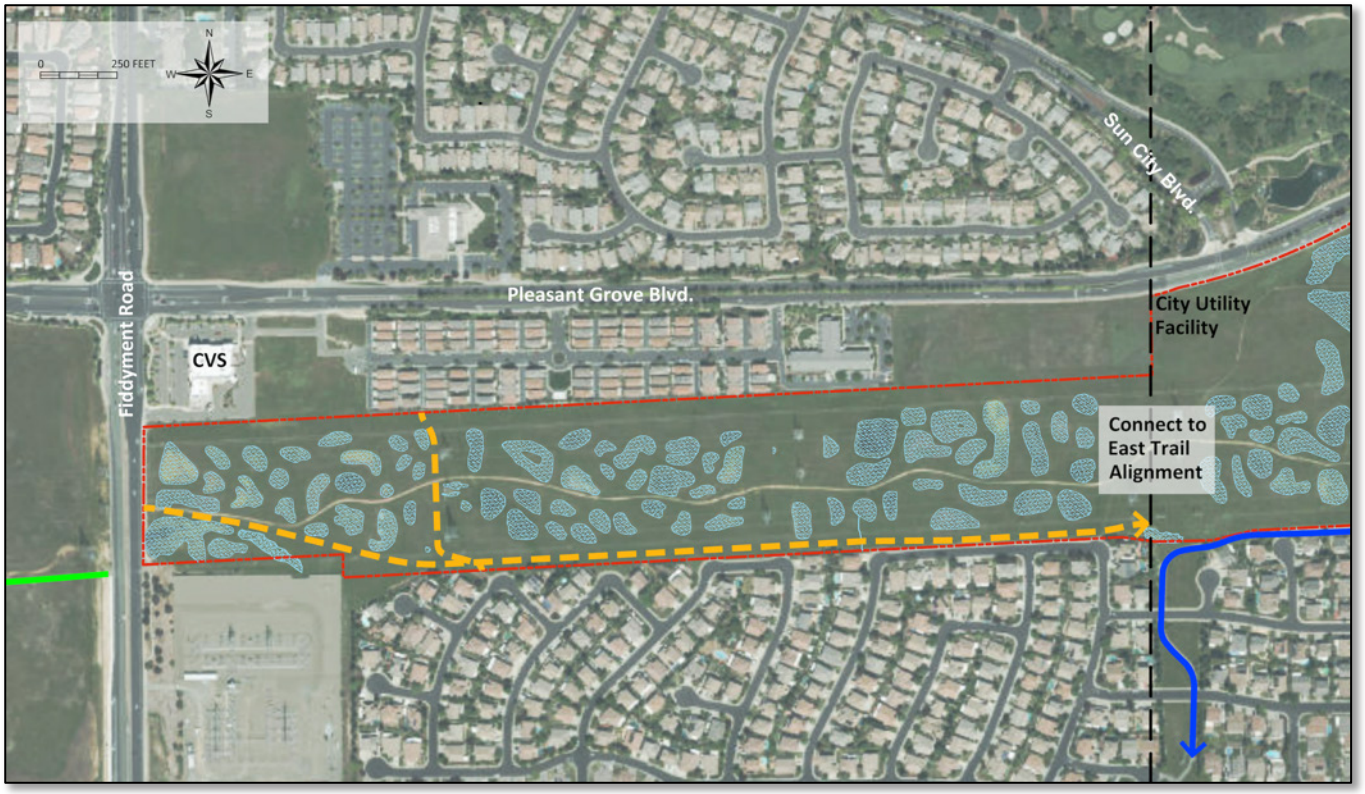
Respondents liked the connection to Fiddyment Road, the north-south connection, and the overall alignment.

Eastern Trail Alignment Preference: **East Option B**

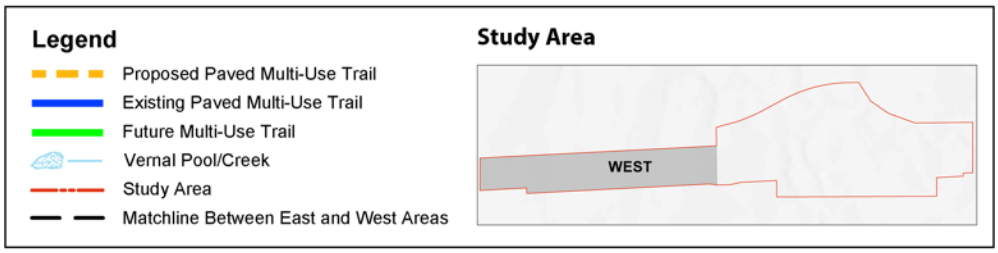


Respondents liked that East Option B would add a paved trail network in the open space that connects to the existing access from Pleasant Grove Boulevard.

Trail Alignment Options

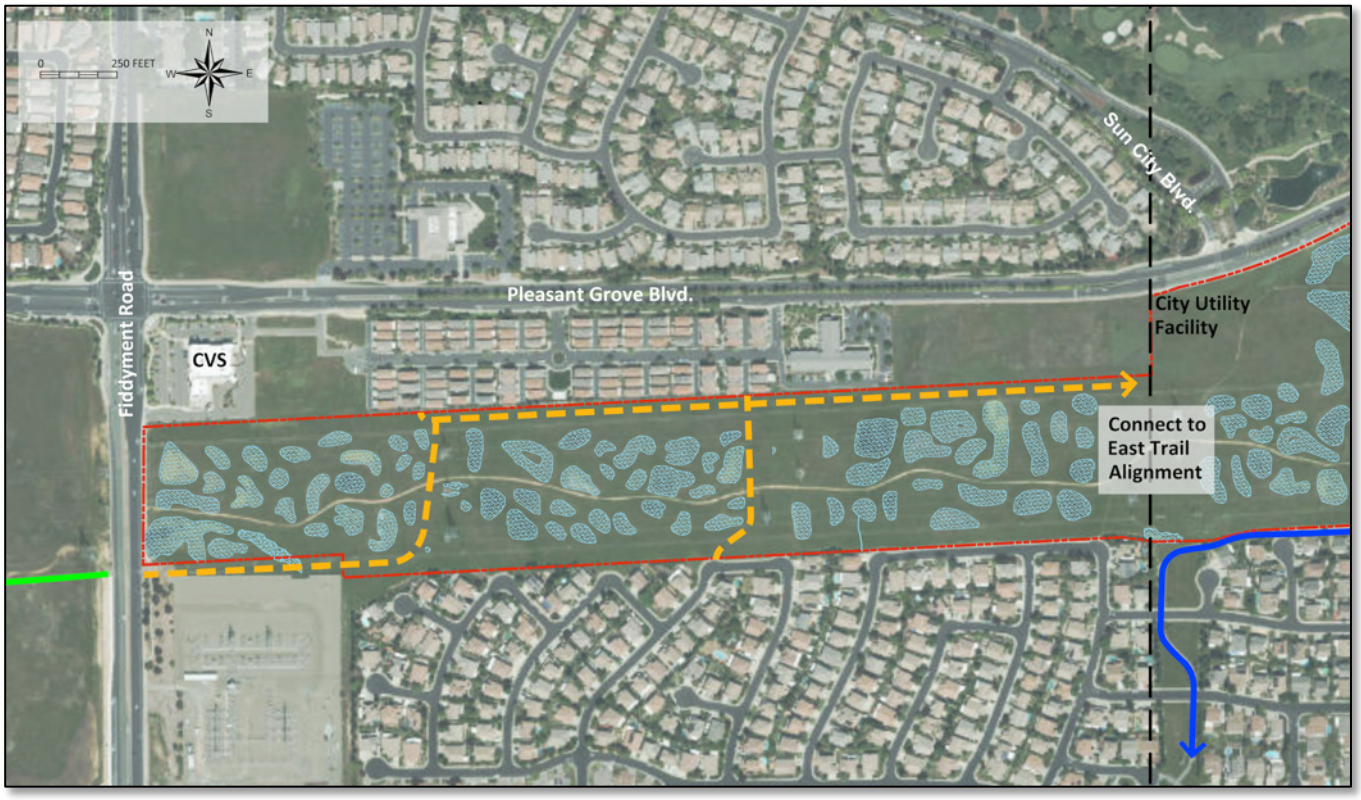


Below are all of the trail alignment options presented in the survey, how they were ranked by participants, and reasons that participants liked or disliked the options.

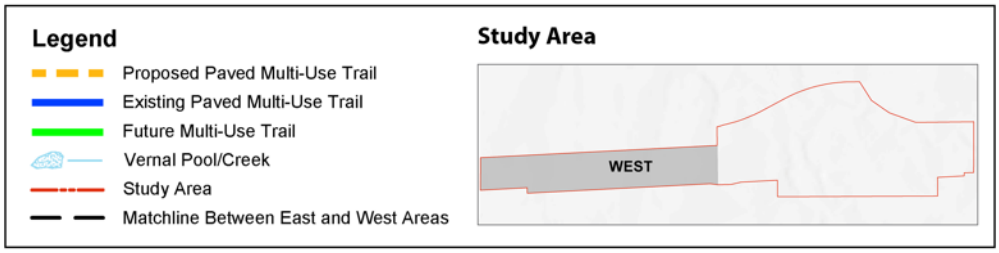


West Option – A: First Preferred Option

- Participants liked that the trail connects to the sidewalk on Fiddyment Road and is closest to the signalized Pleasant Grove Boulevard Intersection crosswalk
- Some respondents disliked the connection to Fiddyment Road.
- Participants liked the north-south connection between neighborhoods and that construction is expected to be most cost-effective due to straight alignment and avoidance of sensitive habitats.
- Some participants disliked that the trail is on the north side of the study area near adjacent neighborhoods.

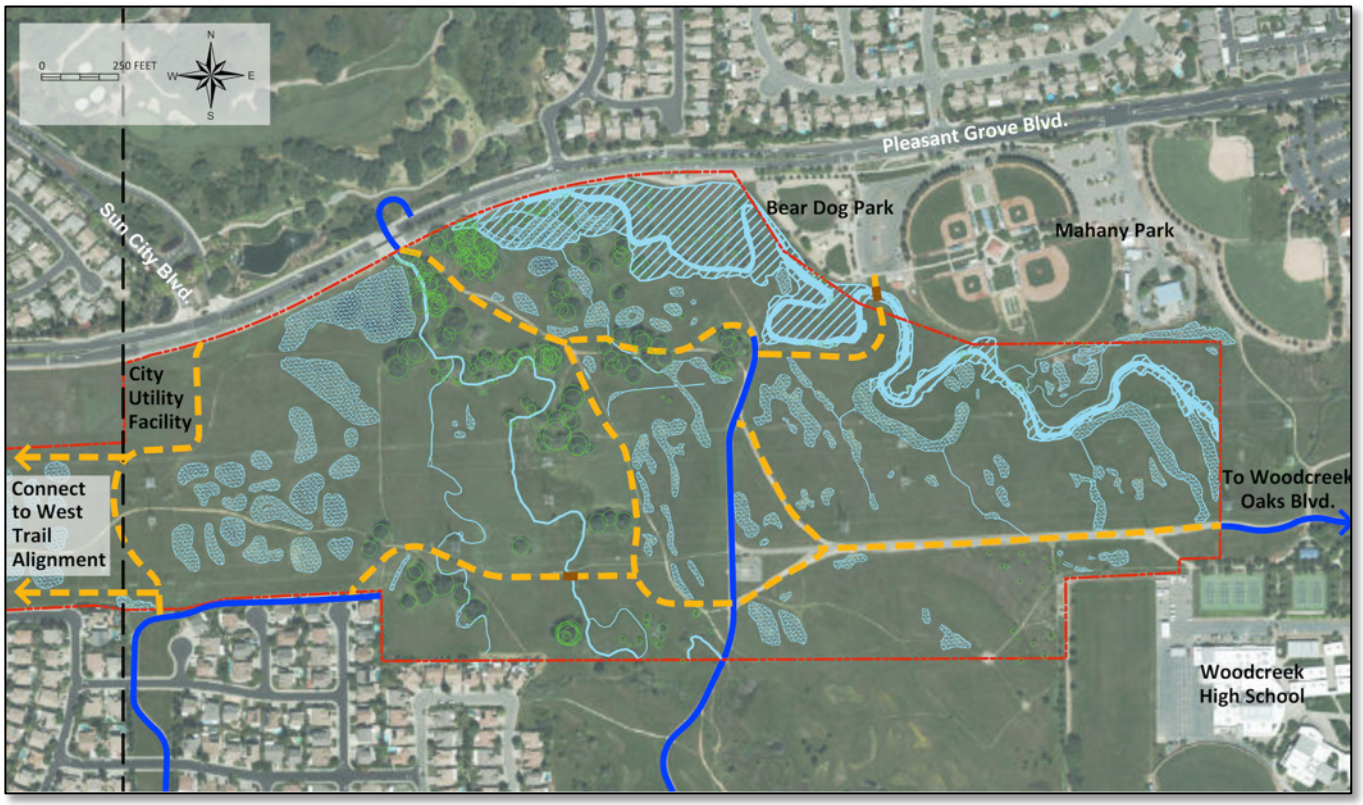


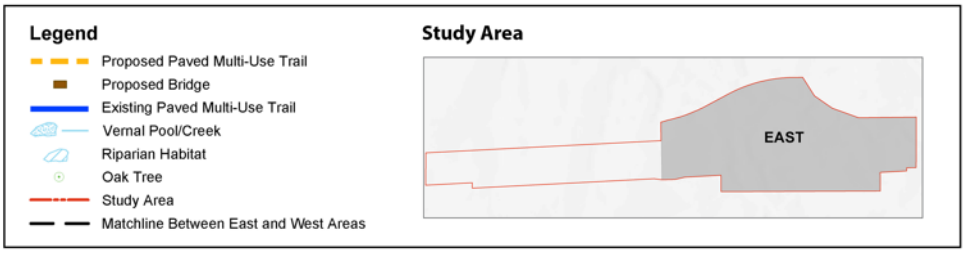
West Option – B: Second Preferred Option



- Participants liked that the trail is on the south side of the study area
- Participants also liked that West Option B has minimal effect on sensitive habitats.

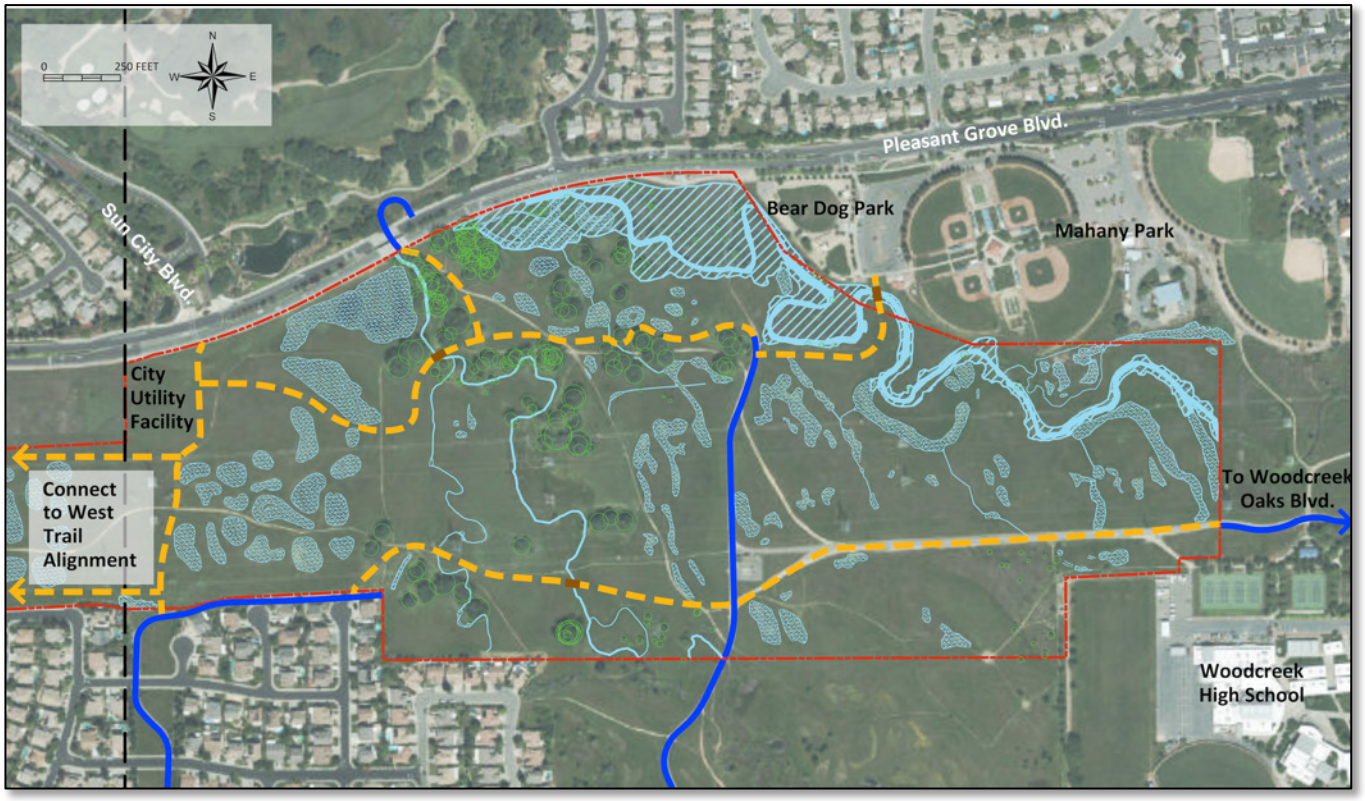
West Option – C: Third Preferred Option



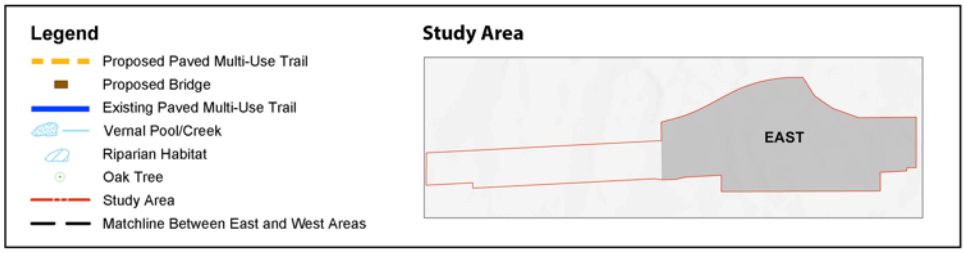


- Some participants liked this option because it would require bike/pedestrian mid-block crossing improvements on Fiddyment Road (e.g., signals, pavement markings, lighting, etc.), allowing for a direct trail connection.
- Participants did not like that this alignment will affect a vernal pool and sensitive habitats and that the alignment is longer
- Participants also disliked that this option would be more costly to construct.

Next, participants reviewed and ranked the eastern alignments.

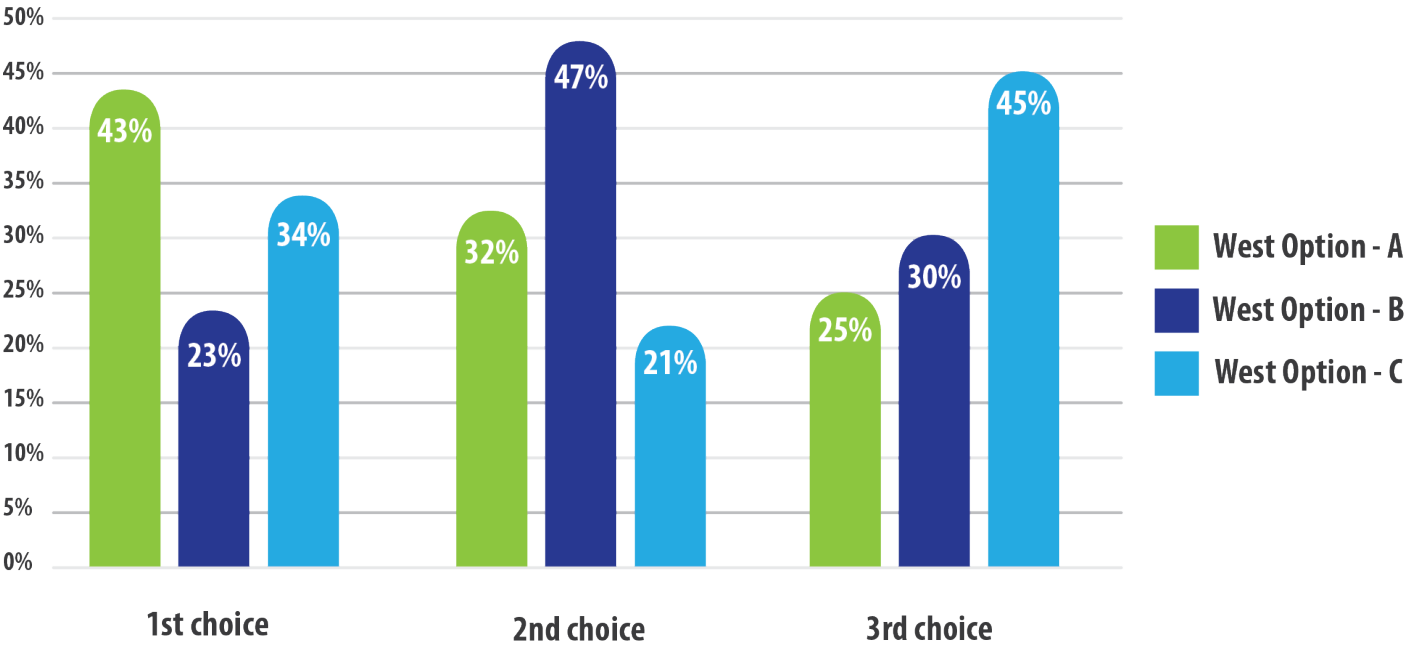


East Option – A: Second Preferred Option

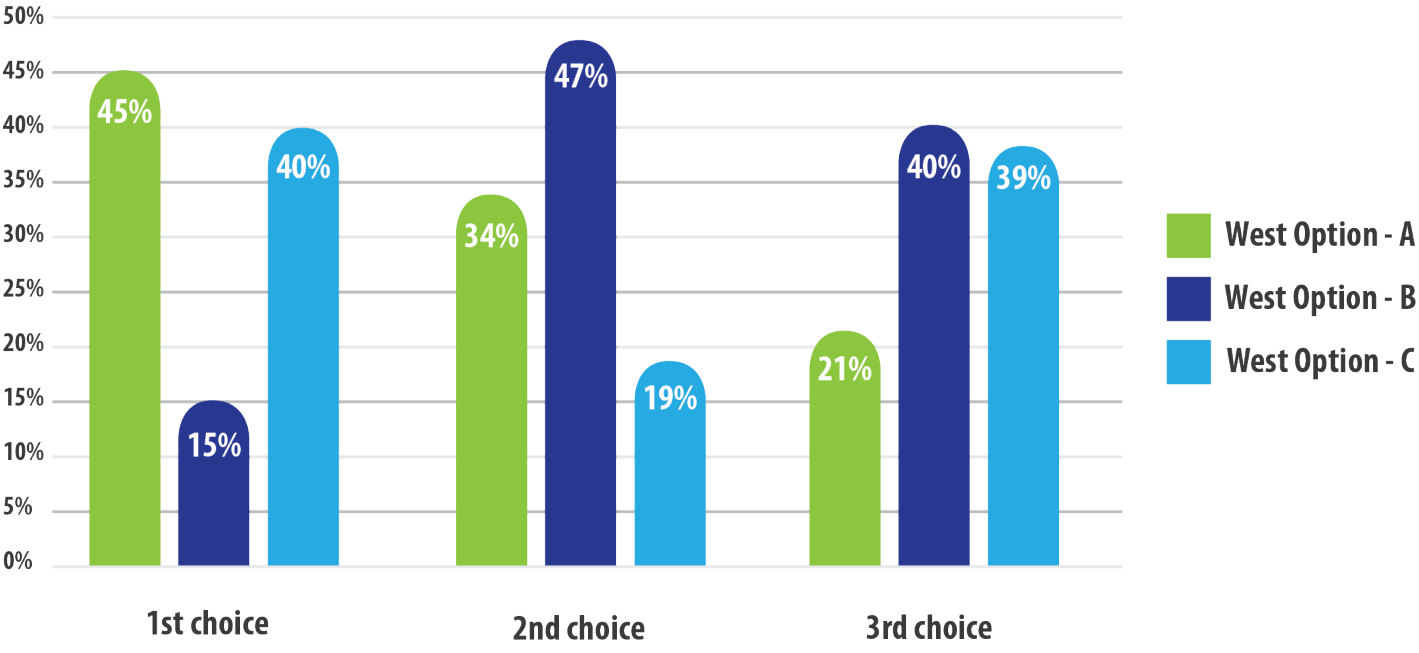


- Participants liked the additional bridge.
- Participants also liked that portions of trail travel through oak woodland, offering shade.
- Some participants liked the north-south connection through the center of the loop.
- Some participants did not like that trail users would need to travel along Pleasant Grove Boulevard to connect to the trail.

East Option – B: First Preferred Option

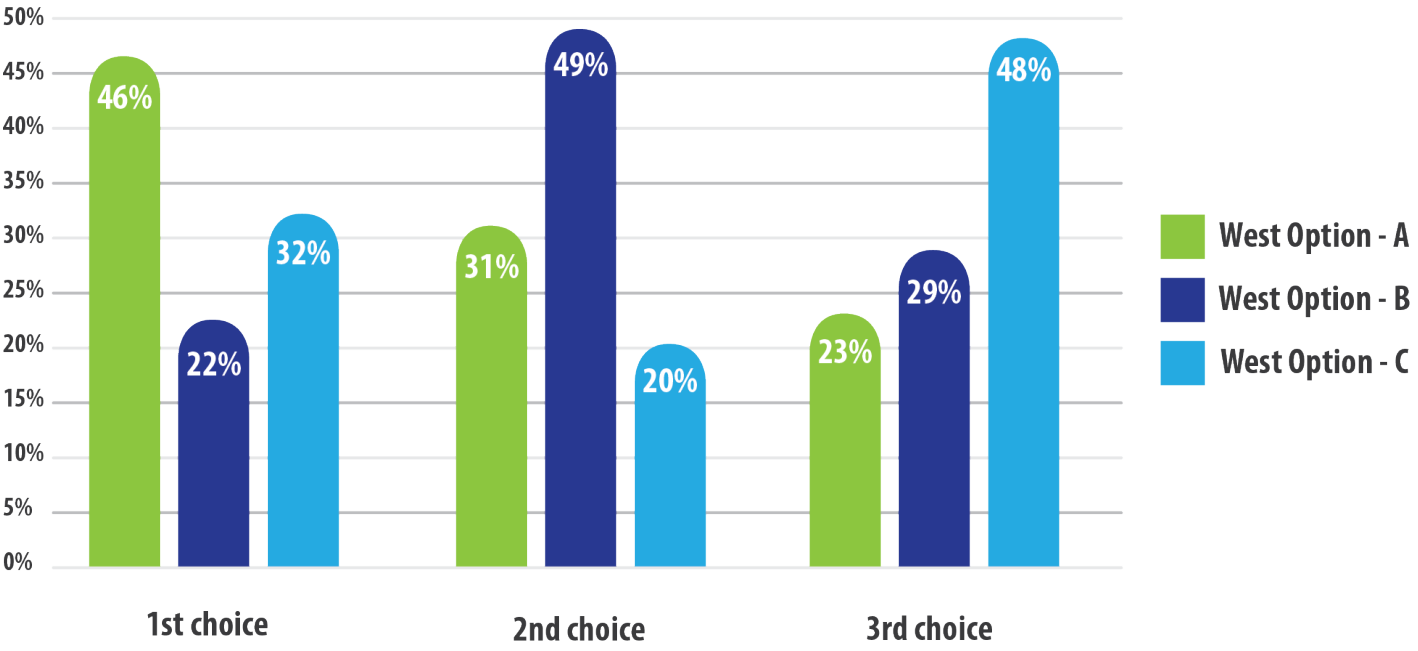


- Participants liked that this option provides a longer recreational "loop" trail.
- Participants also liked the two additional bridges over creeks.
- Participants liked that the trail would allow for trail users to stay off of Pleasant Grove Boulevard and that more portions of trail travel through oak woodland, offering shade.



Overview of Results

Below is a compilation of the feedback received.

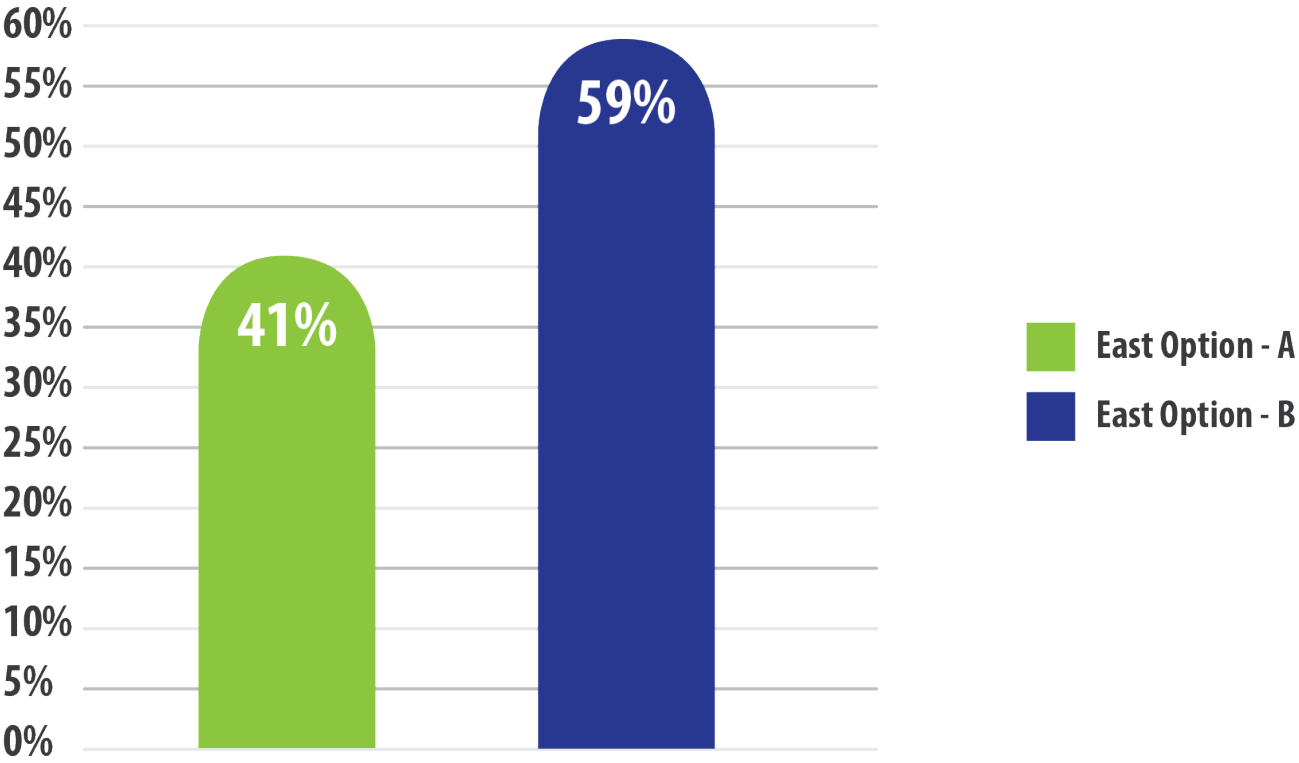


Question 1: Which connection to Fiddyment road do you like the most? (Ranking question)

Question 2: Which north-south connection do you like the most? (Ranking question)

Question 3: Which alignment do you like the most? (Ranking question)

Question 4: Do you have any comments about the West Options?



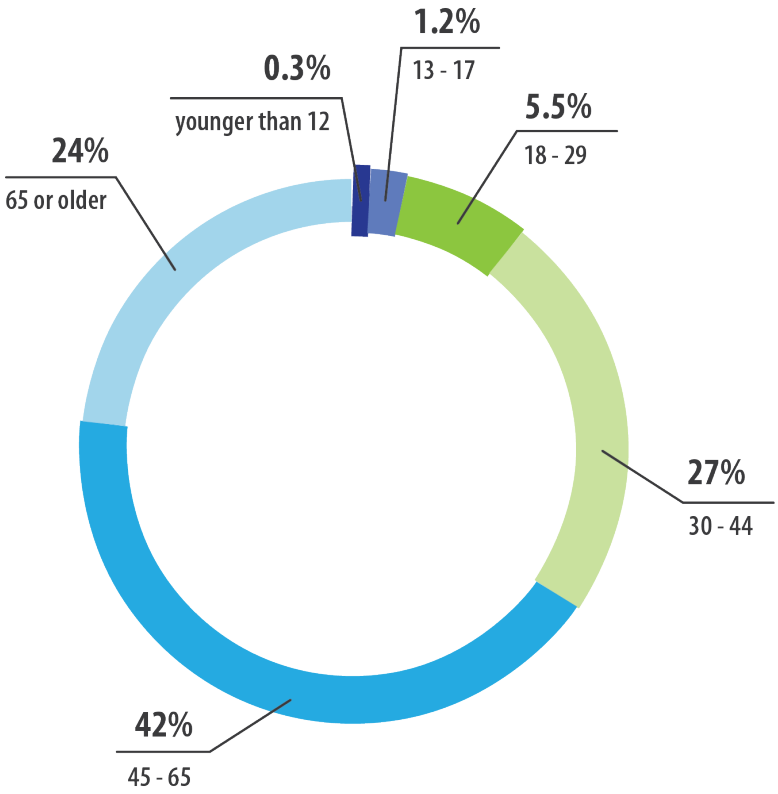
Those who were proponents of West Option C liked the midblock crossing at Fiddyment Road and felt it would be the safest for pedestrians and cyclists. Respondents noted that Option A and B might lead to more unsafe crossings since trail users might be less likely to travel north to the Pleasant Grove Boulevard intersection to cross Fiddyment Road. Respondents also liked that Option C will directly connect to future trails. Those who were against Option C disliked that it was the most expensive option presented, and that it might take longer to construct than other options.

Besides trail user safety, community members were also most concerned with choosing an option that would minimize damage to nearby wetlands and vernal pools. Some comments noted that Option B seemed to be the best option for mitigating impacts to nearby sensitive habitats.

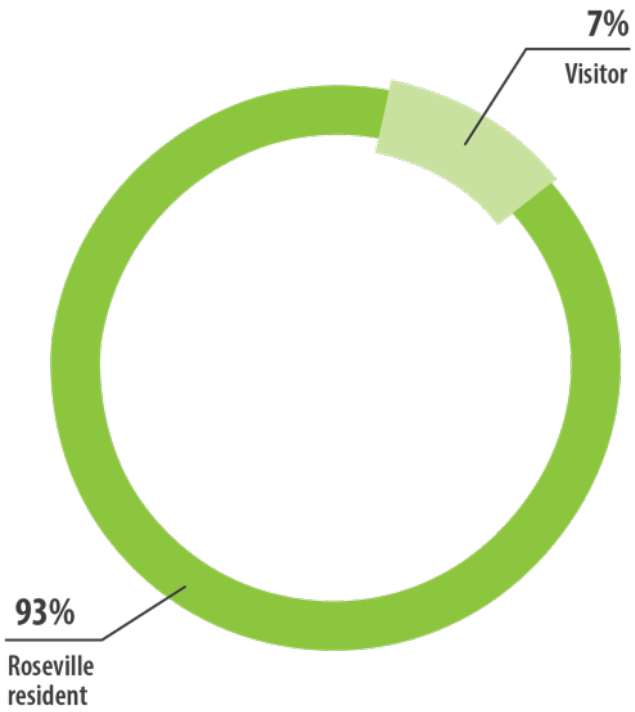
Commentors also showed concern over the paved trail being too close to the northern and southern neighborhoods, and that trail users might disrupt nearby residents. Other concerns listed were that the straighter trail options would not be exciting or interesting for runners and cyclists. Respondents also listed concerns over whether trail users would continue to use the dirt paths, even after a paved trail is constructed.

Finally, respondents wrote about wanting to include other amenities along the trail such as fencing near the entrances for more privacy, benches, bathrooms, dog waste stations, signage and trees or structures to provide shade. A few respondents suggested keeping some dirt paths for runners and people using mountain bicycles.

Question 5: Which option do you prefer?



Question 6: do you have any comments about the East Options



Community members who supported East Option B liked that the paved trail on the north side of open space would allow trail users to stay off of Pleasant Grove Boulevard. Respondents also noted that the paved trail should minimize the impacts to the surrounding wetlands and vernal pools. Many respondents also showed excitement about the bridges and expressed their desire for more ways to cross the creeks in the open space.

Some community members wrote that they liked certain aspects of both Option A and Option B and suggested that the City incorporate some traits from each alignment. Respondents noted that the north-south connection in Option A would be beneficial for overall connectivity within the open space and would reduce the chance of trail users traveling off of the paved trail.

Finally, people also mentioned a number of other amenities that they would like to see implemented along a paved trail such as exercise stations, benches, signage, a basketball court, and increased shade from trees.

On the final page of the survey, respondents could optionally answer some questions about demographics.

If people answered that they were a Roseville visitor, they were also asked to identify which city they are from. Below are the answers:

- Rocklin (4)
- Colfax (2)
- Antelope (1)
- Auburn (1)
- Citrus Heights (1)
- Davis (1)
- Diamond Oaks (1)
- Granite Bay (1)
- Sheridan (1)
- Lincoln (1)
- Loomis Basin (1)
- Sacramento (1)

Communication

- The City of Roseville posted the online community survey on the Mahany Park Open Space Trail Project website, roseville.ca.us/MahanyTrail. Project webpage impressions since survey launch: **1,247**
- Emails to project, trail alert, and main city email newsletter lists: **54,927 recipients total**
- Instagram story and posts: **2,573 impressions, 129 engagements**
- Facebook story and posts (city, parks, and transit accounts): **3,842 impressions, 275 engagements**
- Nextdoor post: **1,968 impressions**
- Twitter posts (city, public works, parks, and transit accounts): **5,810 impressions, 156 engagements**

Informational H-stake signage posted around the open space

Informational H-stake signs were also placed around the Mahany Park open space.

Appendix

- List of community member comments

Appendix of Comments

Social Media Comments

- City of Roseville Facebook:
  - I really love this plan
  - Great idea! Let's do it
  - Great project!
  - I love Roseville's paved trails! My kids and I made use of many of them over the summer as we began an exercise routine. There are some beautiful places in this city! Mahany park would greatly benefit from one of these, as that is a really nice place to walk, but the dirt paths are hard to walk on and hard to see. I would absolutely make good use of a paved trail back there if it were put in! Thanks!
- City of Roseville Instagram:
  - Yes!
  - I'm into it, but I do like the dirt paths for off road biking too.
  - This would be great! We need more trails
  - Yes! As a cyclist, Roseville needs so many more paved bike paths. Folsom has so many more than us!
  - Keep it unpaved
  - No leave it dirt
  - Great idea.
  - Yes please!

- City of Roseville Twitter:
  - What kind of pavement material? Possibly recycled tires would be my choice.
  - If it was up to me, I would just leave it the way it is. We love riding our bikes on the dirt trails and checking out the wildlife. With all of the building that's going on in Roseville, I'm starting to see more and more wildlife making their homes in this area.

Do you have any other comments about the West Options?

- Option A would be a safer alternative to Pleasant Grove, particularly for commuters and errands. Also, may be more viable to plant shade trees.
- Option West B is the best choice for everybody since it connects to existing paths!
- There should be a loop. Bikers, and joggers may like the straight long distances, but disabled, people with strollers and dog walkers tend to go shorter distances and need some shade. Pavement is hot, especially in that big open field in the spring, summer and fall. Since there is none of that in that area a shorter, quicker walk would be more satisfying, hence a loop.
- Use the North to South connection you have on Option A. Use Option A's trail from Fiddyment to the North South connection, but then when the trail reaches the neighborhood have it continue alongside the neighborhood (south) until it meets the pre-existing trail (going around the small vernal pond). I

think that will avoid most vernal ponds and give some variation to the path.

- Alignment should be on the south as this would be more visible and help make it feel safer. Should connect with future trail with mid-block crossing at Fiddyment otherwise there will be too many illegal crossings which would be dangerous.
- Power line crews will continue to use an unpaved path through the area to inspect and maintain the lines. This necessary access will then ensure the continued presence of an unpaved path through the area. For many activities (biking and trail running/hiking) the softer natural surface is desirable, and this alternative dirt trail will be attractive. The city should consciously plan improvements to the unpaved maintenance corridor that would stabilize the soil and support the use of this more natural trail environment instead of assuming that the dirt alternative will naturally disappear when asphalt becomes available. See the example of an uncontrolled dirt path alongside the paved path in the Morgan Creek area between Cook Riolo and Wallerga Roads.
- Please have a mid-block crossing at Fiddyment for safety reasons.
- No power lines above trail is a plus, as is avoiding sensitive habitats. Keeping the connection closer to the Fiddyment Road and Pleasant Grove intersection may keep jaywalking to a minimum.
- Add fencing to prevent people from cutting corners at the path entrances.
- Lease amount of damage to wildlife areas is key.
- Being redirected to the corner signal is definitely out of the way. Any chance for future planning a walkway over Fiddyment? That would make the alignment of C better except for power lines.
- Please add a signal bike crossing on Fiddyment. Pleasant Grove and Fiddyment is too busy for bikes and walking. Also, even though straight paths are cheaper, curves are much more fun for all.
- I would like a path that isn't as straight and winds around some of the pools or creek if possible. Also, if it can connect or have close connection to existing trails that would increase use in total.
- Rather than a non-porous paved trail, how about a gravel trail?
- Consideration of how to connect to the trail when coming from the Pleasant Grove and Fiddyment intersection for bicycles needs to be addressed. It would be dangerous to ride a bike south on Fiddyment against the flow of traffic to access the trail. There is not a safe place to cross Fiddyment to get to the trail for bicyclists riding in the bike lane with southbound traffic on the west side of Fiddyment. The future connection and streetlight are likely years away from being installed.
- Please consider bridges over creeks.
- Please keep existing dirt trail for mountain biking and trail running
- Trail needs to be on south side to prevent countless people trails cutting across vernal pool habitat from the large development.
- I like the direct trail connection to future trails.
- Honestly, I don’t like any of the east-west layouts. Why not just pave down the existing dirt trail under the power lines? I run this trail at least once a week and I’d probably keep running the dirt trail, even if any of these 3 paved trail options existed. The existing dirt trail has numerous bends and slight elevation changes. This is more “interesting” to run than a boring straight path.
- If money was not an issue, Option West-C would be my first choice.
- Curious how you keep people from still using the old trail. It’s really nice how it’s in the middle. Feels more secluded and peaceful.

- No pavement.
- Seems the least impacted currently, needs more pet waste mitigation if it will be more accessible/heavily trafficked.
- Please do not have impact on the vernal pools!! That's one of the charming aspects of this area.
- Connecting at Fiddyment with future multi-use trail is also key (option West C). A big part of the problem with some of Roseville's trails is not having a clear connection between sections.
- I oppose the designated area. I think the designated area needs to adjoin the library and creek area. Not service the new development area. The area you suggest should be paid for by the developers of the new subdivisions W. Roseville Area.
- I do not agree with this project at all and voiced my opinions and concerns on the first survey. Many were of the same opinion about how this will damage the open space beyond repair. Option West C is the worst option and I do not know why it is even considered, given the increases cost and disruption of fragile vernal pools and wildlife areas.
- We live in the houses on Pleasant Grove near CVS that this walking path may go by. I am absolutely opposed to this path going by our tract. While there are fences up for the individual homes that are along the nearby path, I foresee people walking or riding through our neighborhood. So please consider putting this path on the other side like Option B.
- I think the city should seriously consider connecting trail segments that are divided by major roads (e.g., Fiddyment) with pedestrian/bike bridges. Crossing streets such as Fiddyment or Pleasant Grove at cross walks is a harrowing experience, especially during rush hour when drivers are anxious to get to their destination. I'm especially uncomfortable making use of the cross walks with my young children. Having lived in the Valencia/Santa Clarita area in Southern California my family and I made use of the many miles of trails and paseos that were connected via pedestrian bridges across major thoroughfares. This allowed us to access parks, open space, restaurants, grocery stores, and even the mall without ever stepping into a busy road with heavy traffic. The bridges also allowed the city to place holiday decorations, patriotic decorations, and community announcements across roadways which beautified the already visually pleasing bridges and allowed the city to communicate important announcements and city specific messages to every commuter that drove under each bridge. I think the investment in public safety alone would make pedestrian bridges a worthwhile investment. The more our trails are connected the better they will be utilized by both young and old in our community.
- Please quit allowing building and drilling to take place on what was once a protected wetland. This path would not be an issue if apartments, senior living and a CVS were not built in the first place. Protected should be protected.
- Just don't damage the fragile ecosystem, it very important and must be protected. Trash cans must be added to help get trash off the ground and in a place it's supposed to be.
- Wish a nice park with more ziplines and more variety of playgrounds.
- I want whatever has the smallest impact on plants and wildlife in the area.
- would be nice to have signage and shade, at least a little.
- Connecting to the West Park - "future multi-use trail" is extremely important in opting for an alignment project. Fiddyment is a dangerous, large roadway that is not conductive to pedestrian/bike traffic in order to walk all the way down to the

signal crosswalk and then walk back up to the connecting trail. It would have been nice to have a curved trail option but appears not feasible with the vernal pools.

- C option affects the Vernal pools so it shouldn't be done even though it is nice to have more north and south options.
- Why can't there be a continuation of the paved path from where it is (vernal pools) along the black line to Pleasant Grove? Getting to PG without having to jump a stream is key.
- I would do a combination of the options. The trail that runs down the middle of the area makes the most sense for a new paved trail. Minimal disruption, already graded, most likely. Easy to punch in some access points from the neighborhoods to the north and south. It would also be an easy connection to the trail on the east side of Fiddyment Road.
- Need Nighttime lights on trails.
- Trail should lead to crossing Fiddyment again existing signal to optimize bike and per safety.
- Why can't the north/south path just be direct and connect to the road besides the upside down "T" shaped building? It just seems more practical and less invasive to those families living right there on that street where it's designed to come out currently. If straightened it could come out into the parking lot of that building even so people could use their parking lot too for easier, off street access to the trail.
- Honestly this is not what I was expecting for a “Mahany Trail” I was thinking of trails behind the Mahany library and beyond but not all the way to Fiddyment. I live at pleasant grove and Woodcreek oaks and that’s where I walk not down near Fiddyment. This is not useful to me.
- Option A in my opinion is the best choice.
- Please make a basketball court :)
- We shouldn’t pave this area. People will go off the paved path and we will do more harm by bring people and vehicles into this area to pave it.
- I think it's very important to consider input from those whose homes are adjacent to these trails. We don't use the west side of the trial very much, but I feel it's important to connect it to the future trail heading west.
- I’m not sure that paving a trail will help the nature preserve. People like to walk, bike, and run on dirt paths. We have paved surfaces everywhere. This project seems unnecessary.
- Any bridges or paths need to be fire department accessible, and bridges weight rated for fire department apparatus, etc.
- Excited we are putting this together. Another terrific investment in the great city of Roseville
- Alignment C is my favorite but I'm choosing other options based on environmental impact. My concern is that a trail will be developed that is more environmentally friendly, but that people will continue creating their own paths since the trail doesn't go where they want it to go. Perhaps there will be less enviro impact in the long run if paths are built based on where people go.
- This proposed trail must connect to the trail on the other side of Fiddyment Rd, and not rely on the huge intersection that is Fiddyment Rd and Pleasant Grove Blvd. This would give all the neighborhoods south of Pleasant Grove Blvd. quick, easy, and safe access to this proposed Mahany Trail. Additionally, we need to make a safe way for trail users to cross Fiddyment Rd by using a tunnel or bridge, and not by having to stop traffic or creating a crosswalk style crossing, even if it were with a traffic signal. This is because traffic on Fiddyment Rd often exceeds 50

mph and other parts of West Roseville, such as the Pleasant Grove Creek Trail on Fiddyment Rd just north of Blue Oaks, uses a tunnel underneath an overpass.

- The best thing about the exiting dirt trail is that it has some movement/ curves. All the proposed paths appear to be straight. I understand the balance required to protect the environment, but strictly straight paths are boring to ride. The blue oaks to veterans park is a beautifully planned paved trail. I would have liked to see an option more similar to that one.
- I'm concerned that peeps won't walk to the signalized Pleasant Grove intersection crosswalk and will instead try to cross Fiddyment Rd causing road hazards. The closer you can get to a signal will increase the likelihood that peeps will use it. I like Option C the best because it will have a dedicated crosswalk right where it's needed.
- Don't put the trail on the sides near homes. One of the reasons we like this dirt trail is it allows my children and myself to feel out of the city by going through the middle of a wetland or tree covered area. Putting the trail near the home lines will cause noisy walkers near back yards that have always been quiet. There must be an option D that goes through the middle.
- Are these really the only options you're going to give us?
- West Option C for direct connection to trail west of Fiddyment is crucial for ease of users. Diverting to Pleasant Grove is out of way and unlikely to be used.
- I like C for the better connection to future trail west of Fiddyment - though cars speed quite a bit on Fiddyment so would be somewhat concerned with cars, unless there is an actual stoplight there.
- I live in the neighborhood along pleasant grove. How can you put an entrance way, which is right in front of someone's house and down their driveway to the trail? I wouldn't want a bunch of random people walking down my drive and house front!!! so, to me none of those options are acceptable. or maybe your map is not showing where people would enter the trail--it looks to me that in a, b and c some of the entrance ways are off Camino real.
- It's hard to favor any of these options when I live on the west side of Fiddyment. One of my main concerns is the traffic that turns south onto Fiddyment from PGB. Most motorists are too focused on the green light when trying to get south regardless if there are pedestrians walking in crosswalks. What kind of viable option would be available to connect the path from west park neighborhood? I am a cyclist that on average rides 1-2 hundred miles a week. Please consider looking into social media fitness apps as far a current frequently ridden route.
- Boring straight trail will become a fast speedway for bikes. The cost savings will translate into a safety nightmare.
- The most critical thing is that we have paths that connect to one another. Building short little paths that will "eventually" connect to the larger system is a tactic that has been going on for two decades. From North/West Roseville, there is no safe way to commute by bike into Rocklin, Sacramento or certain places within our own city. While we support anything that benefits our environment and the ecosystems of specific parcels, the City of Roseville need to connect existing pathways and focus on making pathways safe through public outreach and adequate signage (walkers/bikers on the left/right).
- Is it possible to accommodate trail runners by putting signage on approved/safe for the local environment dirt trails? This comment applies to any of the open spaces in Roseville.
- Protect the vernal pools.

- Option B seems like a good way to cross from neighborhoods with the least impact for the venial pools yet giving you the opportunity to be the middle and absorb their beauty. Keeping costs down. The only thing I don't like is being under the power lines.
- The most cost effective and least impactful to sensitive areas design is best. One concern is whether people will cut through areas from the north if an actual trail isn't nearby. People will often take (or make) the path of least resistance.
- Please provide public bathrooms.
- Easy connection to other existing or future trails is really appreciated. The ability to use a trail without having to go to a streetlight crossing is preferred.
- I'm not sure a north-south connector is indicated at all; or maybe more are needed. Bikers, walkers and dog walkers are going to enter the wildlife area at access point within a few blocks of their home, regardless of whether it's paved. I would NOT put benches or potties in the area - they will be magnets for after-dark mischief.
- C is too long.
- Where is the bridge located? Ask the kids that go to Woodcreek they ride their bikes that way every day.
- Don't pave it! Please do what bay area does and used a more natural look like crushed granite.
- There is no picture depicting option C....but it sounds awful since it affects sensitive areas, is under power lines, and will cost more. Option B...is not good because it's under power lines and people with some heart issues are affected by being close to power lines. Option A is the best, and only reasonable option because it is not under power lines and will be along a short number of neighbors. I think the less impact on residents (from noise on trail) and less impact on sensitive areas makes this option A much better choice.
- This will be a nice addition to the super nice trails in Roseville. You have and continue to add trails we will really enjoy using in the future. I wish other cities were as willing and proactive in having great parks and multi-use trail. We love them. Keep up the great work.
- I like that the path entrance on Option west B allows access for all neighborhoods to the paved access points, so one single neighborhood street isn't the only spot for access.
- Are there any trees along any of the routes? If not, could some native trees be planted along the south and west sides of the trail to provide shade?
- Option West-C should be eliminated due to having to unsafe crossing of Fiddyment, especially when there are two other existing safe crossing options.
- My main concerns are Fiddyment is too busy to add a new crossing, so I suggest only using the existing light. Also, the fences seem like a natural privacy barrier on choice C. I think it’s bad idea to direct foot traffic so close to the homes that are along Pleasant Grove.
- The existing service road through the middle of the west segment would be the best solution (not A, B or C) for the following reasons. Corridor already disturbed and with a paved path the width of the roadway it can and should be maintained by the entity that owns the power line corridor. Adding another trail alignment will simply split the users into two zones creating more human disturbance within the preserve area. Linkages can be made north-south to connect the neighborhoods. Cost may be slightly higher initially however long term maintenance would be absorbed by others.

- Why not pave the existing foot path already created?
- I don't want to have to go in front of someone's garage to access the trail. None of the north side connections are good. Alignment A would allow multiple north side connections at more public places. On the south side, please connect to the middle of the parallel segment of St Basil instead of in front of someone's home. Maybe consider a second south side connection at Apple Way.
- I like B the best. It connects the best with trail that is already there. And has minimal impact on the environment.
- Multiple access points would benefit neighboring housing.
- I like option C the best, but if the cost is prohibitive (no grant money), then I would go with whatever is cheapest and fastest to construct.
- They are all going to be parking issues. Hopefully most users are those who live in the area and walk to the open space
- Occasional benches would be nice along the paved part.
- Keep the connection close to future multi-use trail.
- Impact on natural habitats (vernal pools/sensitive habitat) should be none to extremely minimal! Having some inconvenience to the human user of this trail is worth saving these crucial environments!!!
- Two connections need to be considered strongly to the community that is to the north or the south. Community connectivity is key for users of the facility. Alternative A appears to be the least connective to all the communities and should not be consider any further.
- Keeping a separate dirt path is something that should also be considered. As a runner I like having the option to go off pavement. The city of Lincoln's bike paths are cut wide to allow side areas of unpaved gavel. Such paths allow for a variety usage.

Do you have any other comments about the East Options?

- All unacceptable.
- Don't hurt the environment, the dirt trails are better on our joints and won't make it so out in the summer, and spring; it needs to be as cool as possible, paint the trail if paved
- Do not neglect the demand for dirt trails. Woodcreek High School has a mountain bike team that practices on the dirt trails that are currently in this area and there are many other uses who prefer to have dirt surfaces to recreate on.
- Please make 2 proposed bridges since they are really need! Especially useful during times of rain when the creek water rises and makes it safer for pedestrians to walk. In option A you have a north south connection that should still remain in option B. Bicyclists/joggers go longer distances. Then casual walkers...that large loop needs to be cut in the middle as option A. The trails have been cut by people who use and love that park Because of the necessity.
- They both look like they cut up the habitat. Is it possible to go around?
- More paving are more options for bikes, which is great!
- Consider non-paved trails in addition to paved trails. I understand the need for a paved trail to connect the bike paths, but not all established trails need to be paved.

- A connector trail on the north end of the park would result in high bike traffic where many people like to enjoy nature and walk dogs. It would be good to keep most of the main bike path on the south end of the park where it already is.
- I think there's potentially a better option than either of these for the East.
- Love the idea of loops.
- I prefer B because I think it is important to have the bridge in the oak trees because people will still attempt to cross there and continue to break down the stream slopes, but people will also continue to use the other trails on the east side of the stream, so you should plan on paving those as well. Those trails would have minimal impacts.
- I like having a loop trail, I would like to have multiple avenues crossing the creeks though.
- I oppose the W. Fiddle-mart Area, designated area. I think the designated area needs to adjoin the library and creek area. Not service the new development area. The area you suggest should be paid for by the developers of the new subdivisions W. Roseville Area.
- I just want whatever has the smallest impact on the wildlife there.
- I bicycle in this area a lot. I do it for exercise and to ease stress. I never plan to go shopping on my bicycle. I do stop for ice cream rarely.
- I like the longer loop trail. Good for bike riding.
- Very pleased this project is under consideration. Thank you for listening to the residents! This will be super helpful for children traveling to school and the park!
- These are both good options, But I like A option a little better.
- Thank you for the bridges.
- It is smart to use existing dirt trails as a basis for the paved multi use trails. People already know where they go and how to access them.
- I prefer more direct north-south connection between Junction and Pleasant Grove.
- Comment was made about one trail having more shade...you could use the acorns shed and plant them alongside the trails after establishing them, that way they improve the trail, and are native. I also hope there are distance measurements on a sign/map somewhere on site. Maybe a few benches under those trees and a fountain at the street, near the map, to fill bottles before starting.
- I appreciate the desire to minimize impact to oak trees and riparian habitat, however East Option B is more like the trails that are currently used and will continue to be used even once the paths are paved. A longer path with shade will be appreciated by the community. The bridges will be a wonderful addition to allow year-round access to the wilderness area.
- We shouldn't pave this area. People will go off the paved paths anyway. We are going to do more harm to the environment by paving the area. People and vehicles will have to go off the path to pave it. Not paving is the best option.
- Make a basketball court it will get a lot of people
- I actually like both of these options. But I like that option A has minimal impact to riparian habitats and oak trees. Could plan C be like A but without the north south portion in the middle? Just have the blue existing trail.
- Same comments about fire department accessibility.

- It would be great to have some outdoor exercise stations along the trails!
- There should be pull-up bars, dips bars, pushup bars, ab stations, and other outdoor calisthenics equipment scattered throughout the trail system.
- A smaller loop would be better for small children and those with limited mobility.
- B avoids having to travel a short stretch along Pleasant Grove.
- People love bridges ... especially in this social media world!
- I regularly run through this area. Although I like the idea of some paved paths, I also really enjoy running on the dirt paths through the oaks - it's one of my favorite parts of my run. I would figure out what ad-hoc paths are being created that are causing problems for habitat and put paved trails in such that they would deter people from these ad-hoc paths, while leaving main dirt paths intact.
- The trail connection to Del Web from the open area needs be fixed. It is always muddy from drainage.
- Again, whichever pathway minimizes environmental impact and maximizes the networking of trials.
- Is it possible to accommodate trail runners by putting signage on approved/safe for the local environment dirt trails? This comment applies to any of the open spaces in town.
- Key point for me is more portions of trail trial through ok woodland, offering shade.
- Please provide public bathrooms.
- Like the bridges that will allow year-round use. Also, like going through oak woodland.
- Option B allows for loop completely internal to the area - this is more preferable than having to be on the Pleasant Grove sidewalk for part of the loop. It would be great if the paved trail could have dirt-gravel 'shoulders' for those wishing a lower-impact walk or run. A few trash cans and dog stations would be awesome, but benches and potties will just facilitate the after-dark substance abuse and mischief.
- Ask high school kids what they prefer? East option B-leaves the middle protected for the little animals. What about the beavers? Are you relocating them?
- Option B is good because a family can stay in the park on the trail the entire time...i.e., not have to go to pleasant grove to make a loop (required in option A). Note: it would be nice if option B had a second trail between the north and south trails, like option A has.
- Don't pave it, used a more natural look like crushed granite.
- In the summer the shade on both options a & b will be nice to have. I also like that the recreational loop will be longer in option b.
- Same comments as I made for the West options.
- A longer trail through the trees is great for bikers, which is how we would use the trail from our home in Sun City.
- North-south connections important because those are currently established routes that will continue to be used.
- Please keep some of the existing dirt roads / paths as unpaved designated jogging tracks (pedestrians only).
- Honestly, these are both good options.
- Good that you are keeping paved connection to commuter buses stop

- The missing paved sections in B will still be heavily used. The logical plan is to provide multiple pathways through points for the amount of traffic on the trails.
- Option A provides the most connectivity as well as paths along what appears to be unpaved paths already. The section of Option B that is from the "City Utility Facility" and Pleasant Grove Connection where the Blue U-Turn is located should be include as part of Option A. This would allow for users to have two separate looped routes without having to access Pleasant Grove Blvd which is a high traffic stress facility for alternative modes of transit.

Please share any additional comments or questions about the Mahany Park Open Space Trail Project.

- Not pleased with any development within this entire area. Leave it alone.
- I walk the trail a lot. Will be glad to see more paved path. I am a Sun City resident.
- Please keep any traffic away from the homes on Pleasant Grove.
- Just be Conscious about your surroundings, they environment is the best part about Roseville, and it needs to be kept clean and healthy. I'm an athlete these things are very important to me!
- Roseville has a very large population of cyclists who prefer off-road type riding using mountain bikes as well as many trail-runners who prefer the reduced physical impact that dirt trails provide. Currently, Roseville offers ZERO officially planned or sanctioned trails for this use. This has led to Roseville citizens traveling away from the city for other locations in Granite Bay, Lincoln, Auburn and Folsom to ride and run on dirt trails, as well as the "spontaneous" creation of trails like those that currently crisscross the Mahany Park Open Space and "Wildlands" to the west of the hospital. While adding to the paved trail network is important, it is not the only way to improve citizens access to quality recreation in our city.
- New to the area...just found the ravine trail from old town to Sierra College Rd. Based on that trail I wholeheartedly support this project. It will be a wonderful addition to our neighborhood and city.
- Did you know coyotes come into that field at night and pass under the bridges on Pleasant Grove into Sun City? Occasionally they can be seen early morning returning to the golf course. Also, thank goodness, we still might Hear and see a pheasant. Early in the spring a great horned owl had a nest with her 2 babies in this area. A lot of people responsibly use the area, but I fear encouraging Even more people with PAVED trails might scare these beautiful animals away. Can't it just stay the way it is with the exception of those bridges??
- Please provide water fountain, including lower connection for dog water too.
- Curves, inclines, declines, bridges, loops, trees, creeks, all of these features create a fun trail to recreate on. Don't avoid the features that are already there. Put as much of the trail next, in, over and through them.
- Please add a restroom.
- Let's keep it as natural habit as possible. That's why people attend the area. Keep it simple.
- Again, PLEASE consider a variety of pave/non-paved trail options.
- Would be nice to have trail connect somewhere to parking lot in front of Riley Library where there is plenty of parking that doesn't compete with the dog park and Pony League baseball fields.
- Please maintain some non-paved trails in the for easy mountain biking. My kids are learning to mountain bike in this area and it is great to have a few miles of dirt trail so close by. I am also in favor of

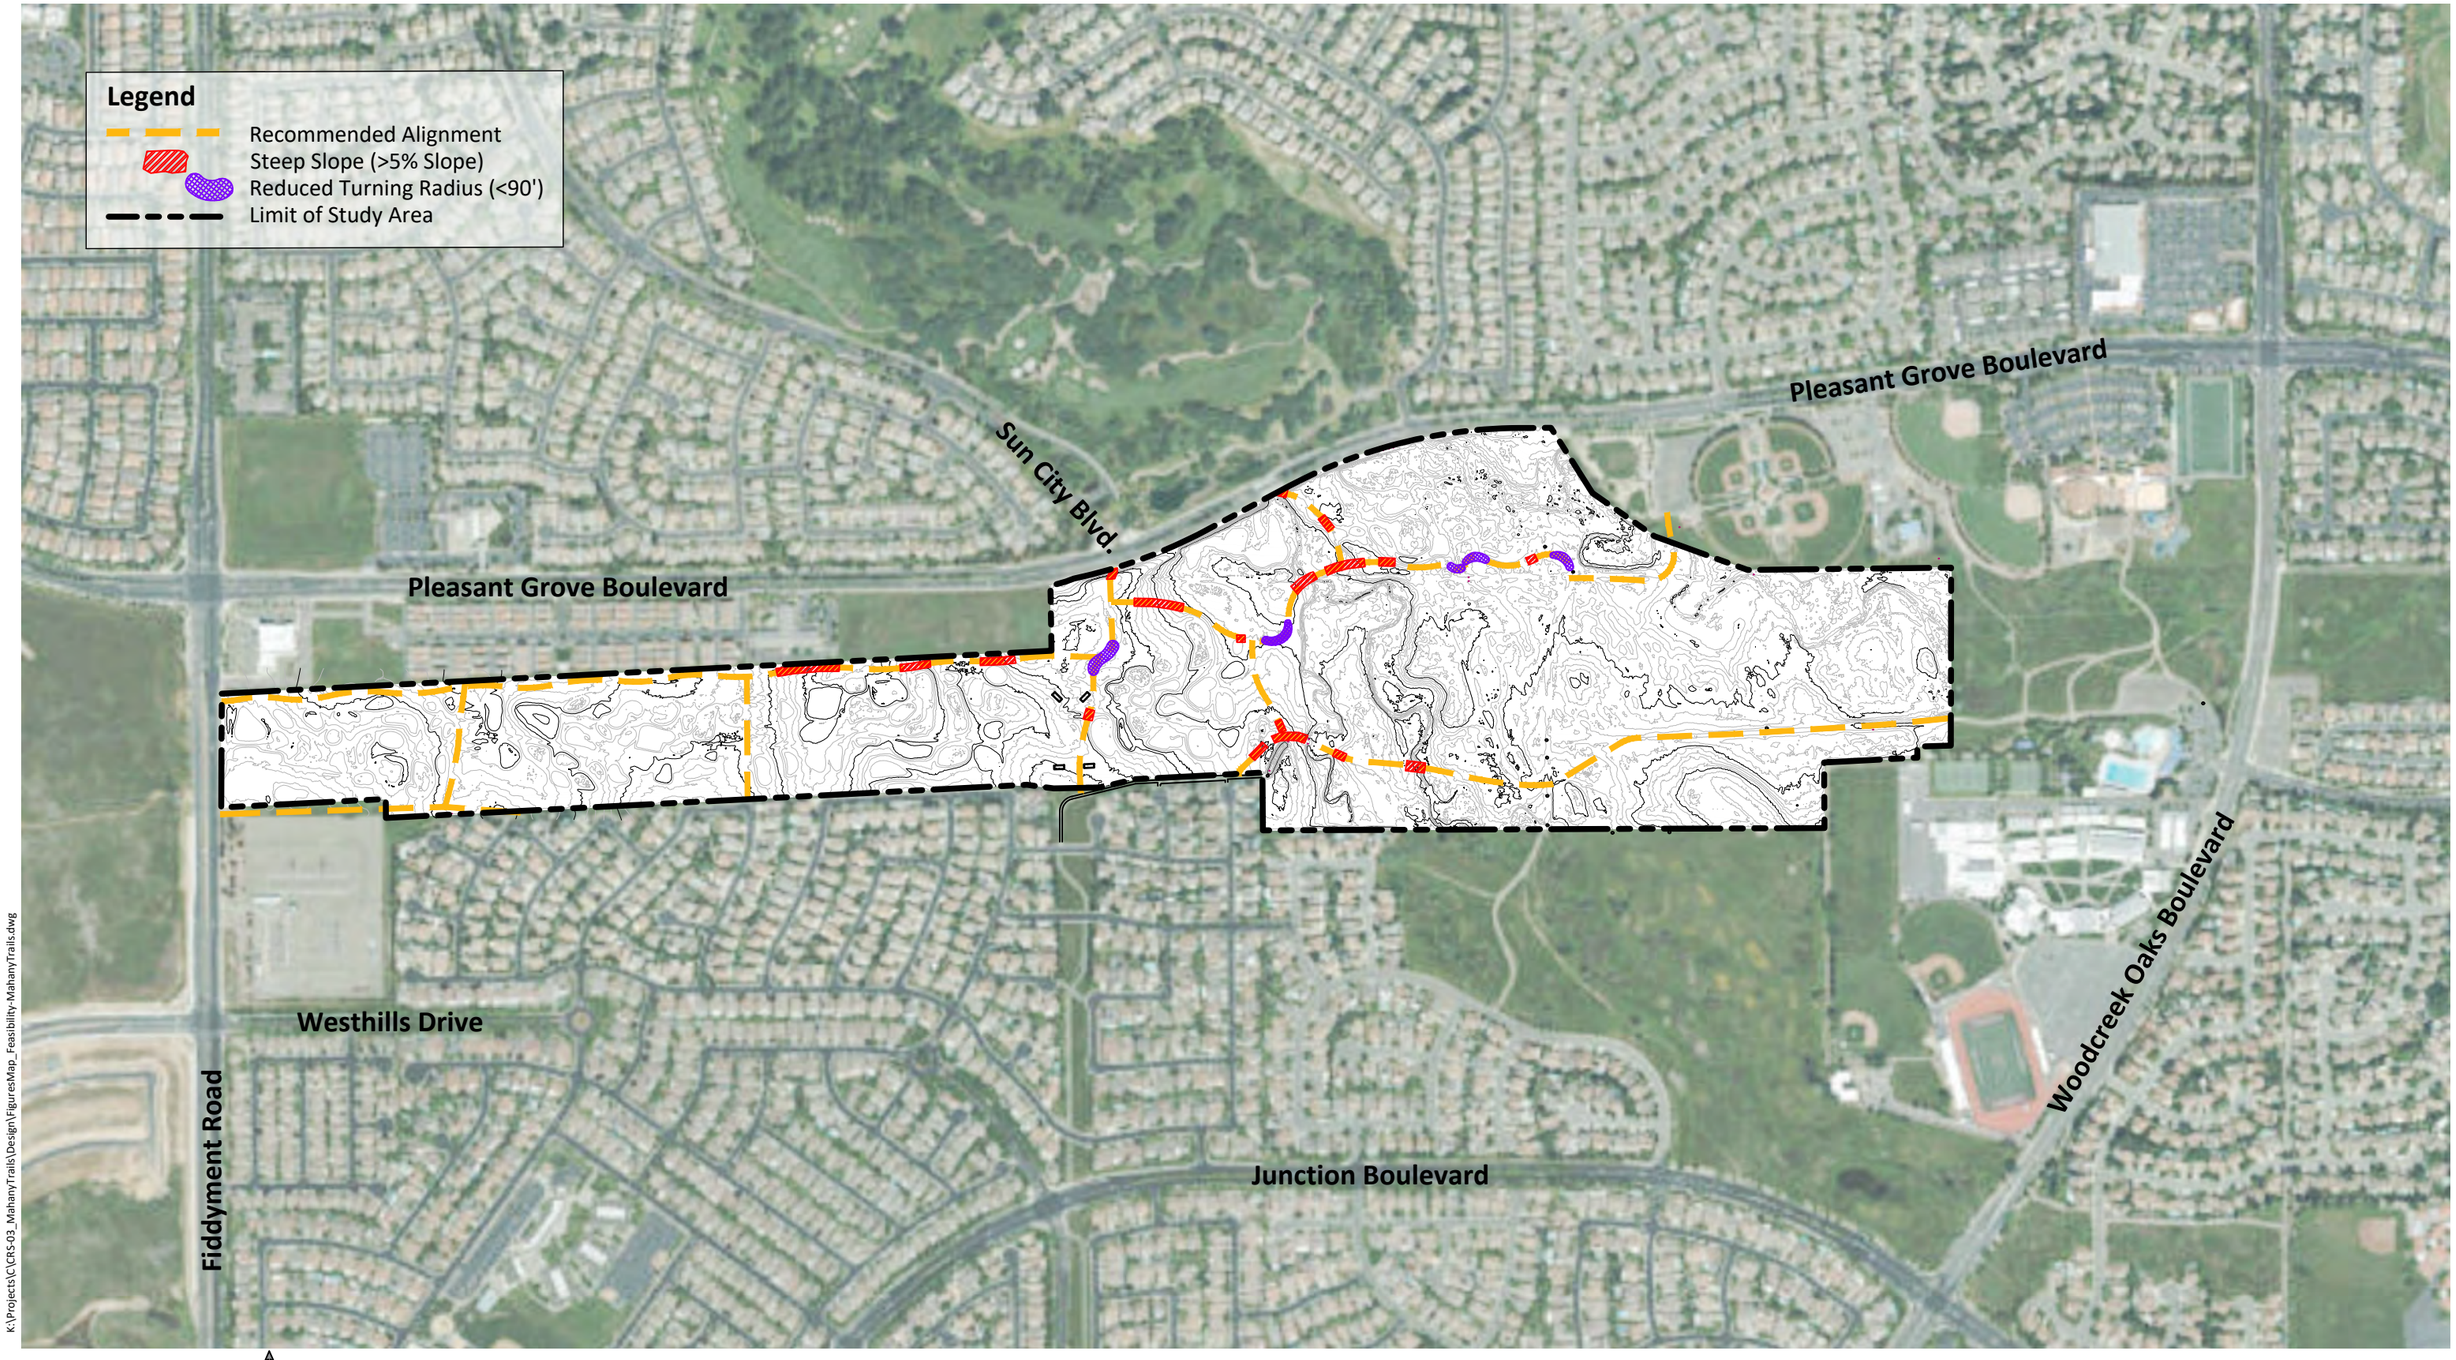
paved multi-use trail(s) as well for walks and running, especially to connect the new neighborhoods with the trail system.

- Please create the main bike path on the south end of the park where the most traffic already is, and trail would have little to no environment impact.
- The idea of additional trails in the area is always a big plus for Roseville residents.
- However, the trails are built, they will add greatly to the recreational value of the adjacent communities for me and fellow bikers/hikers, this will expand our options, especially during wet weather months. And I favor finding ways to protect habitat and undo the ways that social trails have impacted the habitat. Are there volunteer groups interesting in being ""friends of Mahany Park?"" Perhaps a volunteer organization could help with certain maintenance and improvement. Examples: restoring signs that explain the habitat, adding rest stops, doing fund raising for other maintenance.
- I am just hoping that people on bikes will stop creating their own paths through the sensitive habitat areas. I love the idea of making the area more accessible, especially since I often have a stroller.
- It would be really cool if you could build fun flowy mountain bike trails with jumps
- So excited. Roseville is such a great place to live.
- How will this be paid for. Developers W. Subdivisions should be paying for this green belt park.
- I didn't see the first survey, but this is one of my favorite areas to ride my bike through. One of my favorite things about Roseville is the great bike lanes and paths that make it easy for me and my family to go by bike.
- Love this. Looking forward to riding from West Park to Mahany on these trails very soon!
- Please, please choose to protect our wildlife first.
- If option C for the west side is selected, there should be a pedestrian/bicycle bridge to safely cross Fiddyment road since vehicles pass at high speeds.
- I am against any of these projects. The open space should be left as it is - natural for all of the creatures that inhabit the area to have their habitat and for the few people that walk on the natural paths or ride a bicycle to enjoy nature as it is.
- It sure would be nice if there were cross walks across the main streets where the trails terminate. Just to give the cars a heads up that there may be pedestrian traffic. I'm going to cross weather there is a cross walk or not (I do walk my bike). I do not like riding my bicycle the wrong direction on the road and I am not going to walk 1500 yards to the corner to cross at a light.
- Can you do anything to beautify that old pumping station? It's a decrepit eyesore and it stinks.
- As stated, this project is much needed and very appreciated! This will assist greatly with our children's access to schools and park areas! Thank you for creating an easily understood survey and summary of results!
- Don't forget garbage cans for dog waste and at least two benches.
- This project is long overdue - glad to see it is moving again!
- Need more trees for shade.
- I would hope that the trail being made would be made from as natural a material as possible, perhaps recycled tire shreds? Does it absolutely have to be paved? Natural as possible is best and as little intrusion into the wetlands as possible, the better, as we're already surrounded by plenty of concrete and asphalt. Maybe seek help with native

plantings by getting ahold of the Placer Co. Extension Master Gardeners who can help or direct you to help from college students or other groups promoting native plantings. They can be beautiful!

- Really hard to make a connection to the west end without seeing a map without seeing how it all for together or if I could access the trails safely now and what it would look like.
- It should be built in the least invasive way, so the habitat is protected.
- I love this area because it isn't paved. It's unfortunate that there are power lines there, but we all use electricity, so I get it. I don't see the benefit to paving when people go off trail regardless of a paved path and they are is going to be trampled so we can by construction workers so we can pave it.
- Once again, this project seems unnecessary. People like being in places that look more natural (although the power lines pretty much ruin that).
- It would be great to have some outdoor exercise equipment for the community, such as pull-up bars, parallel bars, and ab stations. Would really help encourage healthy lifestyle fitness practices for the community and for Woodcreek high students. The cost and maintenance would be very low but provide a lot of value to residents.
- Benches!
- Please create an undercrossing on Fiddyment Rd to create a safe way to cross Fiddyment Rd by connecting the proposed Mahany Trail to the future trail just on the other side of Fiddyment Rd serving the West Park and Sierra Vista neighborhoods south of Pleasant Grove Blvd.
- Though I live in Citrus Heights, I frequently use the multi-use trail systems in Roseville.
- In addition to Option A, there should be a bridge going over the Riparian habitat to connect to the existing path that stops just short of the creek. A paved path can then connect the Pleasant Grove sidewalk to the bridge. Currently, people bring make-shift materials to build their bridge...
- This would be wonderful! I'm a runner, and I much prefer the trails to running along busy streets.
- Very much looking forward to the improvements - thank you so much for doing this and for allowing community input!
- It's hard to favor any of these options when I live on the west side of Fiddyment. One of my main concerns is the traffic that turns south onto Fiddyment from PGB. Most motorists are too focused on the green light when trying to get south regardless if there are pedestrians walking in crosswalks. What kind of viable option would be available to connect the path from west park neighborhood? I am a cyclist that on average rides 1-2 hundred miles a week.
- Please make connecting the existing trails within Roseville a priority.
- Repeating my earlier comment here, but basically you have a decent amount of trail runners and off-pavement dirt trail users in the open spaces. This applies to current spaces, and future plans. If these users are unknowingly impacting the local species and environments, is it possible to have them accommodated in the plans for new trail work? Meaning, include in the plan for dirt trails that are of commensurate length to the paved trails with similar amenities (access to shade, logical routing, enough distance to be useful for runners, signage)? Also, recommend including enough groomed dirt trail directly adjacent/off the side of the paved trail so users can pass each other while maintaining more reasonable social distance. When the paved trails of this size are busy it is hard to maintain a social distance...except when there is enough room to step off the trail by four to six feet and keep running on

the side gravel/dirt. Hope that makes sense.



- I like to option you have proposed. It will be a great place to ride or walk when it is complete.
- It would be helpful if the plan also provided for a multi-use trail adjacent and parallel to the sidewalk(s) along Pleasant Grove Avenue, instead of depending on the use of sidewalks along Pleasant Grove Avenue. It is important that the plan provides for public bathrooms.
- For the west side, I would oppose any option that presages a new stoplight on Fiddyment. Please see previous comments in favor of a Dirt/gravel walk/run shoulder to the new paved trails for lower impact walking; and in opposition to benches and potties that encourage after-dark substance abuse & mischief. A few well-placed trash cans and dog stations would be awesome! Am concerned about the use of strollers on these trails - I recently had to detour around a group of three. Strollers that completely took up the trail, necessitating off-trail passage by everyone else.
- Please have the high school students put their input in, I think they would be honored to be included
- I think Roseville is great in how it creates these parks and trails for people. Families included. Though I think more porta-potti's would be nice...especially for families with kids. Adding trails in this park is a wonderful idea!
- A parallel dirt trail for runners and the Woodcreek HS MTB team would really be appreciated. I run in parks to avoid pavement.
- I am so happy this is finally getting done.
- The west option is boring. People are not going to walk along a fence line. They are going to continue to use the trail right thru the middle. There are NO parking options for getting on the trail in the Fiddyment area. The Eskaton apt lot is private and we already have scofflaws from the Camino Real homes parking in our lot because they don't have enough parking for their residents. CVS won't want people parking in their lot. The vacant land behind CVS is already a nightmare with abandoned cars, motorhomes on the dirt etc. and the city won't do anything about it. The trailer has been there 3 years and there are unregistered cars that have been their 2-3 years!
- This plan is long overdue and would create an environmentally conscious trail access for everyone.
- I'd love to see the trail eventually connect easily to the trail that goes through Diamond Oaks to get to the Fountains.
- I run early morning. I live between Junction and Baseline and use the bike path to head over to the Mahany area. I also will use the same are to do banking and light groceries. I also cross Woodcreek at Mahany Pool and use the bike paved area up there. I would love additional bike/paved space to connect over to Pleasant Grove and the Sun City area.
- I use the Bear Dog Park very often and appreciate trails connecting the communities to this park to ensure the continued use of the park. Please consider lighting along this path as users who would use the trail late at night may not feel safe.

TRANSPORTATION COMMISSION COMMUNICATION

Title:	Mahany Park Open Space Multi-Use Trail Feasibility Study
Contact:	Jeannie Gandler jgandler@roseville.ca.us 916-746-1289

Meeting Date: 5/18/2021
Item #: 5.1.

RECOMMENDATION

Staff recommends the Transportation Commission request the City Council accept the Mahany Park Open Space Multi-Use Trail Feasibility Study and direct staff to pursue funding for the next steps leading to trail construction.

BACKGROUND

The approximately 133-acre Mahany Park Open Space Study Area (Study Area) is located in western Roseville between Fiddyment Road and Woodcreek Oaks Boulevard, south of Pleasant Grove Boulevard. The study area is adjacent to Mahany Park, the Roseville Aquatics Complex, and Woodcreek High School on the east and bounded by residential development on the north and south. Although part of the project area is a public park, most of the area was designated as an open space preserve in the early 1990's when residential construction projects were approved along the southern border of the Study Area. At that time, the west half of the Mahany Park Open Space was established as a preserve, and approximately 10 acres of vernal pools were created and interspersed with naturally occurring vernal pools throughout the area. The Silverado Oaks Urban Reserve, another open space preserve, is also located immediately south of the Study Area.

Study Goals and Process
The purpose of this feasibility study is to explore the potential for a paved multi-use trail through the Mahany Park Open Space, resulting in a conceptual alignment, cost estimates and next steps leading to construction. Helix Environment Planning was hired to complete the study which included the following tasks:

- Establish a Project Development Team comprised of the consultant team and relevant City staff;
- Field walks and preparation of Biological Resources, and Opportunities and Constraints reports;
- Develop and implement a robust public engagement program to learn about current use and desired uses of the open space area;
- Evaluate previously approved planning documents and suggested trail alignments including the City of Roseville Bicycle Master Plan (BMP), the Roseville Open Space and Overarching Management Plan (OSOMP) and Specific Plans for developments adjacent to the area;
- Consultation with regulatory agencies regarding acceptable uses in the open space;
- Develop potential trail alignments for public review;
- Evaluate trail alignments based on public review; and,
- Develop a recommended alignment and cost estimate.

As described above, the Study Area includes open space and open space preserves that were established to protect natural resources, including vernal pools, wetlands, creeks and oak trees. However, the area has become popular for walking, running and biking and many user-created dirt paths have been established through the area. A paved, connected trail system through the open space may reduce impacts to natural resources, would provide additional year-round recreational opportunities, and would improve the connectivity of the City's trail system.

A trail through this area has been considered in several previous planning documents, including the Roseville Open Space Overarching Management Plan (OSOMP), the City of Roseville Bicycle Master Plan, and Specific Plans for developments adjacent to the area. This study refines the trail alignments previously considered in those documents based on site conditions, public engagement, information gathered from regulatory, utility, and City agencies and input from the City's project development team.

Public Engagement
A robust public engagement process was developed to inform the public about the study, current conditions, and to learn about potential user preferences leading to a recommended trail alignment. However, due to COVID-19 precautions and public health guidelines, public engagement components had to be adjusted. Methods of engaging the public and informing them about the study and the public engagement process and components included:

- Direct mailers
- News feature on ABC 10

- Email newsletters
- Facebook, Twitter, Instagram, Nextdoor notifications
- Signage in the project area.

Additionally, a project website was created and updated frequently by City staff, and includes an informational video. In-person workshops were replaced with two interactive online surveys. The first survey was designed to inform the public about the study, to learn how people currently use the open space, and how they would like to use the open space. The second online survey presented trail alignment alternatives based on information from the first online survey, field walks, site analysis including Biological Resources, and Opportunities and Constraints reports, assessment of existing planning documents, consultation with regulatory agencies, phone interviews with stakeholders including Woodcreek High School biology and extra-curricular program teachers, and utility agencies.

Evaluation of Alignment Options

Trail alignment options, developed from the first public engagement/online survey along with a thorough assessment of existing conditions, were presented in the second public engagment/online survey. To simplify the presentation of the trail alignment options, the Study Area was split into east and west sections. Three trail alignment options were developed for the western half of the Study Area and two trail alignment options were developed for the eastern half of the Study Area. Any of the western trail alignment options would connect with either of the eastern trail alignment options.

The western and eastern trail alignment options presented in the second online survey, also listed specific features of each trail alignment which contributed to the suggested location of the trail. Trail alignments were chosen that would include some or all of the following features:

- Avoid sensitive habitats including vernal pools
- Provide shaded areas
- Provide a points of interest/educational opportunities
- Provide north-south connections through the open space to neighborhoods, shopping, schools, parks, roads, and transit stops
- Close gaps in the existing paved trail system by connecting to existing paved trails
- Connect to a planned trail in an adjacent development
- Connect to roadways near controlled intersections

A recommended alignment was developed based on thorough site assessments and the results received from the second public engagement/online survey.

Recommended Trail Alignment

The recommended trail alignment was developed using information from existing planning documents, site assessments resulting in the Biological Resources, and Opportunities and Constraints reports, interviews with stakeholders, a robust public engagement program including two online interactive surveys, consultation with regulatory agencies, and ongoing coordination with City departments. The recommended trail alignment combines elements of the western and eastern trail alignment options presented in the second public engagement/online survey. It closes gaps in the existing bikeway system with approximately 2.4 miles of new trail through the Study Area. The proposed alignment is comprised of paved trails which provide varying lengths of recreational loops and connect users to all existing and planned trails surrounding and leading to the Mahany Park open space. The recommended trail alignment will also:

- Provide multiple connections to the surrounding neighborhoods, schools, transit stops, roads and parks
- Provide permanent all-weather crossings of creeks in the Study Area to allow safe use year-round
- Protect natural resources, including vernal pool habitat
- Maintain required access for existing utilities
- Close gaps in the trail and bikeway system to provide safe, convenient bicycle/pedestrian connections to recreational, educational and employment opportunities for people of all ages, abilities and incomes, and,
- Include a variety of amenities along the trail.

The preliminary cost to construct the trail, including a mid-block crossing on Fiddyment Road, ranges from 4.3 million dollars using standard paving materials to 6.7 million dollars if permeable materials are used throughout. This cost estimate includes all of the remaining steps to complete the project, which include additional traffic studies for a proposed mid-block crossing of Fiddyment Road, geotechnical studies, additional studies required by regulatory agencies, preliminary engineering, environmental reviews, permitting, final design, and construction.

Funding

Funding for the next steps of this project have not been identified. At City Council direction, staff will pursue funding through various federal, state and local sources over the next several years to complete the project. General Fund and Measure B funds were not used for this study and are not used for multi-use trail construction.

Respectfully Submitted,

Jeannie Gandler, Administrative Analyst II/Bikeways

Jason Shykowski, Public Works Director

COUNCIL COMMUNICATION

CC #: 1524
File #: 0600-02

Title: Out-of-State Travel Request - Police Department
Contact: Mark Peinado 916-774-5021 mcpeinado@roseville.ca.us

Meeting Date: 6/16/2021
Item #: 7.34.

RECOMMENDATION TO COUNCIL

Staff request that Council approve out-of-state travel for four School Resource Officers (SROs) to attend a Campus Safety Conference in July, located in San Antonio, Texas.

BACKGROUND

The Roseville Joint Union High School District (RJUHSD) plans to implement a multi-disciplinary behavioral threat assessment and management model at each campus. Roseville Police Department's SROs will be closely involved with the implementation and training of this model and will be involved on each multi-disciplinary team.

The 2021 Campus Safety Conference is an educational conference that brings together security, public safety, emergency management, administration and facilities responsible for protecting K-12 and higher education districts and campuses from across the country. By attending this conference, Roseville Police Department's SROs will be able to learn from experienced professionals and explore methods and leading practices in safety and security.

FISCAL IMPACT

The RJUHSD will be fully funding all travel and training expenses for three officers. The total cost for the fourth officer to attend this conference is $1,616, which includes flight, meals and hotel. There are sufficient funds in the proposed FY2021-22 Police Social Services training budget in the General Fund to cover the expense.

ENVIRONMENTAL REVIEW

The California Environmental Quality Act (CEQA) does not apply to activities that will not result in a direct or reasonably foreseeable indirect physical change in the environment, or is otherwise not considered a project as defined by CEQA Statute §21065 and CEQA State Guidelines §15060(c)(3) and §15378. Approval of out-of-state travel meets the above criteria and is not

subject to CEQA. No additional environmental review is required.

Title: Roseville 80 - North Van Parking Lot - Parcel Map
Contact: David Samuelson 916-774-5442 dsamuelson@roseville.ca.us

Meeting Date: 6/16/2021
Item #: 7.35.

RECOMMENDATION TO COUNCIL

It is recommended that the City Council take the following actions:

1. Approve the parcel map on file with the City Clerk and accept on behalf of the public the easements offered thereon, and approve the abandonment of the easements listed thereon.

BACKGROUND

The Development Services - Engineering section has reviewed the subject parcel map and found that it is in compliance with the Subdivision Map Act and the City's Subdivision Ordinance and all conditions of the tentative map have been met.

This map will be creating four industrial parcels.

FISCAL IMPACT

No fiscal impact to the General Fund.

ENVIRONMENTAL REVIEW

The project consists of a minor land division resulting in four parcels in an urbanized area zoned for industrial purposes; therefore, the project is categorically exempt from the provisions of the California Environmental Quality Act (CEQA) pursuant to CEQA Guidelines Section 15315, and Section 305 of the City's CEQA Implementing Procedures.

COUNCIL COMMUNICATION

CC #: 1522
File #: 0102

Title:	Council Discretionary Funds - Roseville Crime Stoppers
Contact:	Heather Blanco 916-746-1171 hblanco@roseville.ca.us Sonia Orozco 916-774-5269 sorozco@roseville.ca.us

Meeting Date: 6/16/2021
Item #: 8.1.

RECOMMENDATION TO COUNCIL

Recommend the City Council consider a request for $2,000 from Council Discretionary Funds for Roseville Crime Stoppers in support of their annual Fourth of July Fun Run.

BACKGROUND

The request is for $2,000 from Council Discretionary Funds for Roseville Crime Stoppers for the annual Fourth of July Fun Run. The funds raised through runners' fees and sponsorship are used for cash rewards for information leading to arrests and convictions in serious crimes committed in Roseville. The funds are also used to grant scholarships for Roseville youth pursuing careers in public safety, and community education on public safety issues.

Roseville Crime Stoppers did not apply for the Citizen Benefits fund in FY2020-21, although they indicated they have applied for grants in the past, but felt the discretionary funds request is more focused on specific event sponsorship.

The Citizens' Benefit Fund was established in 1993 with the net proceeds from the sale of the Roseville Hospital. The City Council may, after receiving the recommendation of the Roseville Grants Advisory Commission, annually appropriate up to 90 percent of the annual earnings of the Citizens' Benefit Fund for the purpose of improving the quality of life for the citizens of the City of Roseville. The City Council, without the recommendation of the Roseville Grants Advisory Commission, may annually appropriate a minor amount up to $15,000 of the annual earnings for the purpose of improving the quality of life in Roseville.

FISCAL IMPACT

There is no fiscal impact to the City's General Fund. Annually, the Assistant City Manager/Chief Financial Officer allocates $15,000 of the annual earnings on the Citizens' Benefit Fund per section 4.06.040 in the Municipal Code and includes it in the annual budget along with the Citizens'

Benefit Fund resources available for appropriation each year. These earnings are restricted for the purpose of improving the quality of life for Roseville residents and appropriated by the City Council. The balance remaining in the Council's Discretionary Funds for FY2020-21 is $16,509.

ENVIRONMENTAL REVIEW

The California Environmental Quality Act (CEQA) does not apply to activities that will not result in a direct or reasonably foreseeable indirect physical change in the environment, or is otherwise not considered a project as defined by CEQA Statute §21065 and CEQA State Guidelines §15060(c)(3) and §15378. The award of funds meets the above criteria and is not subject to CEQA. No additional environmental review is required.

Description

Roseville Crime Stoppers Request

Roseville
Crime Stoppers

May 19, 2021

Krista Bernasconi, Mayor
City of Roseville
311 Vernon Street
Roseville, CA 95678

Dear Mayor Bernasconi and City Council:

Roseville Community Crime Stoppers requests a $2,000 sponsorship of its annual Fourth of July Fun Run which serves the community in three important ways:

1) The Fun Run provides Roseville families with an opportunity to enjoy time outdoors together in a safe and healthy activity in celebration of our nation's founding. This year we will be holding the start and finish in Downtown Roseville and have added vendor booths to drive attendance for the Run, Downtown, and during and after the City Parade
2) Roseville Community Crime Stoppers is managing a new software program in cooperation with the Roseville Police Department, having put in place a completely anonymous tip and reward software program for our community
3) Funds raised through runners' fees and sponsorships are used for:
    a. Cash rewards for information leading to arrests and convictions in serious crimes committed in Roseville
    b. Scholarships for Roseville youth pursuing careers in public safety
    c. Community education on public safety issues through distribution of educational materials at public events, and hosting community events such as our Forum on current public safety trends.

The City of Roseville has supported the Crime Stoppers Fourth of July Fun Run for many years with sponsorship. That support, combined with community business and individual sponsorships, provides most of the Crime Stoppers' funding each year. Without it, we would be hard-pressed to support police criminal investigations as we do and provide scholarships to deserving youth and continue our public awareness outreach activities.

Over the 25 years that Crime Stoppers has served the community, we have provided several thousands of dollars in rewards that led to over a hundred convictions and tens of thousands of dollars in recovered property. More than 30 Roseville high school graduates seeking scholarships have received some $30,000 in grants to support their college aspirations. And our Forum on public safety drew some 200 residents. We plan follow up sessions at other venues in the months ahead. The City's annual sponsorships help make these activities possible.

We would greatly appreciate the Council's granting this sponsorship request again this year. If you do, we pledge to apply the funds as we have in the past to doing all we can to keep Roseville a safe place to live, work and play.

Respectfully,

Anne Carpenter, President

Title: Placer County 2021 Redistricting Process and Timeline
Contact: Sonia Orozco 916-774-5269 sorozco@roseville.ca.us

Meeting Date: 6/16/2021
Item #: 8.2.

RECOMMENDATION TO COUNCIL

Accept a presentation by Jane Christenson, Placer County Assistant Chief Executive Officer regarding Placer County's 2021 Redistricting process and timeline.

BACKGROUND

Below are excerpts from a memo presented to the Placer County Board of Supervisors at their May 11, 2021 by Jane Christensen, Placer County Assistant Chief Executive Officer. This information requires no action by the Roseville County Council as it is informational only.

The United States Constitution requires a count every ten (10) years of everyone residing in the United States. Information from the U.S. Census is used to help determine where to locate schools, daycare centers, roads/public transportation, hospitals, and other facilities, and is used in making decisions regarding business growth and housing needs. Census data is also used for geographically defining state legislative districts, which initiates a “redistricting” process that begins in the year following a Census. Additionally, U.S. Census data allows county officials to realign supervisorial districts in their counties, considering shifts in population growth since the last Census and assuring equal representation for their constituents in compliance with the “one-person, one-vote” principle of the Voting Rights Act.

The California Elections Code provides basic criteria and process requirements the Board is required to consider in redistricting supervisorial districts. In addition to the Voting Rights Act, consideration is given to the following factors in order of priority: (1) geographic integrity of any local neighborhood or local communities of interest, (2) geographic integrity of any cities or census designated places, (3) easily identifiable and understandable districts bound by natural and artificial barriers, including streets and boundaries of the county when practicable, and (4) encouraging geographical compactness so that nearby areas of population are not bypassed in favor of more distant populations.

At its January 26, 2021 meeting, the Board of Supervisors reviewed a proposed 2021 redistricting timeline. Then, at the February 9, 2021 meeting, the Board approved an updated timeline and authorized the County Planning Commission to serve as the Advisory Redistricting

Commission. The Board also directed staff to initiate work efforts to develop a plan for Placer County supervisorial districts in accordance with State and Federal law. At that time, staff outlined the new laws and requirements for the 2021 process and highlighted the challenges of the then-anticipated federal Census Bureau final data delays which inform map redistricting efforts. These delays, coupled with the state deadlines for county redistricting maps, would result in a significantly compressed timeline for community involvement/outreach over the ensuing year.

Updates from the February 2021 Placer County Board of Supervisors (BOS) Report:

Since the February BOS report, there have been several developments impacting the 2021 Placer County redistricting process and timeline, as summarized below:

- The Federal Census Bureau has announced final data will be provided to the State of California by late summer – slightly earlier than last reported but still much later than the traditional spring data receipt timeframe.

- Consistent with past practice, the State then takes approximately 30 days to review the data to adjust for incarcerated populations before transmitting data to the counties.

- With County final data receipt now anticipated late September, staff was very concerned with the compressed timeline/process, especially given the State's deadline for County redistricting maps, which necessitates Board map approval by ordinance by November 15 (30 days to be effective by current State deadline of December 15).

- Taken together, these delays would allow the County weeks rather than months to create draft maps, obtain public input, draw final maps, and submit them for County Board of Supervisors' approval – a challenging timeline resulting in a compressed window for public map review.

Concerned with the practical impacts of these delays on our Placer County redistricting process, staff worked with Shaw, Yoder, Antwih, Schmelzer & Lange (SYASL), state lobbyists, to advise the Senate Elections and Constitutional Amendment Committee of these challenges. In response, SB 594 (Glazer) has since been advanced to address these compressed timeline issues and provide counties relief in the deadline to redistrict County supervisorial district boundaries. At this writing, SB 594 is moving forward in the legislative process, with final action anticipated before summer. A CEO letter expressing support for this measure is attached, dated April 9, 2021. Also attached is an April 21 letter expressing similar concerns by the CA State Association of Counties (CSAC), the CA Association of Special Districts (CASD), the League of CA Cities (CalCities), Rural County Representatives of CA (RCRC), and Urban Counties of CA (UCC).

Additionally, and in response to increasing public inquiries on the 2021 redistricting process and timeline, County staff has prepared a County redistricting website to provide additional information (www.placer.ca.gov/redistricting). While we anticipate additional updates will be published in the coming months, the current site includes information on:

- the anticipated public meeting schedule for the Advisory Redistricting Commission,
- frequently asked questions (FAQs),
- a mapping hub to provide feedback, access data and view maps when available, and
- the opportunity to sign-up to receive further updates as the process and timeline evolve, pending state legislative action.

This will be a useful resource for interested parties until such time outreach efforts get underway this summer.

Placer County Community Outreach Plans:

For prior redistricting efforts in 2001 and 2011, the County's community outreach included information-sharing with area cities, special districts, school districts, Chambers of Commerce, and Municipal Advisory Committees (MACs). For 2021, staff plans to conduct targeted outreach to cities and special districts such as the Placer County Water Agency, especially as its boundaries are co-terminus with supervisorial district boundaries, as well as hearings with the Advisory Redistricting Commission. Given the still-compressed timeline, other community outreach plans include convening sub-regional town halls (East Placer, Mid-Placer, South Placer), similar to the 2019 Charter Review Committee outreach process, inviting other key stakeholders and ensuring public input is sought in ways that are safe and consistent within current State Covid-19 guidance.

Additionally, the County will provide opportunities to inform the redistricting maps through surveys and public testimony to allow community members to identify geographic areas with common links based upon economic or social interests. The effort to identify communities of interest will also include support from the *Placer Counts Coalition*, which supported the Census outreach effort in 2020. Community outreach efforts will predominantly occur over the summer months (in advance of Census final data receipt this fall) to inform interested parties on the process, milestones, and opportunities for input once map alternatives are available for review/comment.

The timeline for these efforts – based on what is known/anticipated at this writing, is presented below.

Revised 2021 Census Process & Timeline (as of May 11, 2021):

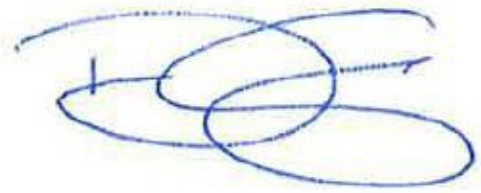
Jan 26 & Feb 9	Board Review/Approval of 2021 Redistricting Process
Feb – May 2021	Staff Analysis of Preliminary Census Data Staff Development of Preliminary Boundary Map Alternatives Staff Advocacy for SB 594 on State Map Deadlines/Requirements 2021 Redistricting Process/Timeline Update to BOS
June 2021	Advisory Redistricting Commission Hearing (tentatively set for June 24)
July – Sept 2021	Pre-Final Data Community Outreach/Subregional Informational Mtgs
Fall 2021	Advisory Redistricting Commission Hearings (dates TBD)
Nov - Dec 2021	BOS Consideration/Action on Revised Boundary Map
Early 2022	Anticipated State Deadline (revised per SB 594) for Revised Boundary Map

The above revised timeline allows for the completion of the Placer County 2021 redistricting effort with ample opportunities for community input/participation, Advisory Redistricting Commission hearings, and Board review/approval, in compliance with Federal/State requirements and the unfortunately compressed timeline due to U.S. Census Bureau final data delays.

FISCAL IMPACT

Not applicable.

ENVIRONMENTAL REVIEW



The California Environmental Quality Act (CEQA) does not apply to activities that will not result in a direct or reasonably foreseeable indirect physical change in the environment, or is otherwise not considered a project as defined by CEQA Statute §21065 and CEQA State Guidelines §15060(c)(3) and §15378. A presentation about the Placer County 2021 Redistricting process and timeline meets the above criteria and is not subject to CEQA. No additional environmental review is required.

Description

2021 Placer County Redistricting Process PowerPoint

2021 Redistricting Process

Jane Christenson, Assistant County Executive Officer

May 11, 2021

Background

- Census completed every 10 years
- Impacts funding for schools, infrastructure, housing, and more
- Shifts in population growth help inform redistricting process
- Helps define legislative district boundaries
- Assures compliance with Voting Rights Act

CA Elections Code

- Provides basic criteria and process
- Aligns with Voting Rights Act
- Must consider in this order:
  1. integrity of neighborhoods and communities of interest
  2. integrity of cities and census designated places
  3. natural and artificial barriers, including streets
  4. geographic compactness

Current Timeline

Compressed map review due to data delays

Current Timeline Concerns

Under the current timeline, Placer has roughly **7 weeks** to draft maps, obtain public input, draw final maps, and submit them for BOS approval.

Title: Results of National Community Survey
Contact: Megan MacPherson Scheid 916-774-5455 mscheid@roseville.ca.us

Meeting Date: 6/16/2021
Item #: 8.3.

RECOMMENDATION TO COUNCIL

Receive results of the National Community Survey conducted among Roseville residents in Spring 2021. Roseville rose to the top of the rankings among hundreds of cities nationwide in a variety of categories related to utilities, city services, economic vibrancy, and quality of life. Commend City staff on residents' acknowledgement of the quality of services the City provides and express appreciation to the community for their support of the City of Roseville.

BACKGROUND

To help inform the deliberations with broad-scale perspectives from residents, Roseville participated for the first time in the National Community Survey (NCS) in January and February 2021. The NCS, conducted in 500 cities in nearly every state in the country, is done in partnership with the International City/County Management Association. The City participated in order to benchmark and track satisfaction levels and priorities over time in our community on a bi-annual basis. This will inform the City's strategic plan, budget, and shed light on perceptions about city and community services.

More than 3,000 surveys were mailed at random to residents, evenly distributed throughout the five districts. The survey was available in English and Spanish. All mailings contained paragraphs in both languages instructing participants on how to complete the survey in their preferred language.

About 1% of the 3,000 mailed invitations or surveys were returned because the household address was vacant or the postal service was unable to deliver the survey as addressed. Of the remaining 2,972 households that received the invitations to participate, 476 completed the survey, providing an overall response rate of 16%. This provides a level of confidence of 95% and a margin of error of plus or minus 5%.

After the survey that was distributed randomly had closed, the same survey was then opened to the entire community to anyone who wanted to provide input. A survey link was provided on the City website, newsletters, and social media. Those results are included separately in the NCS report.

Key highlights from Polco's summary of the National Community Survey

Most of Roseville rankings were higher than both the national average (of 500 cities) and the custom benchmark (of 50 cities nationally of similar size of 100,000-200,000 population). Many rankings were in the top 10 nationally and several were No. 1 in the nation.

- Roseville received the No. 1 ranking as a place to live, for its reputation and image, quality of utility infrastructure, electric utility, wastewater utility, and storm water management.
- No. 2 in the custom benchmark for quality of services provided by the City, overall customer service provided by City employees, and overall economic health.
- In addition, 95% of residents rated Roseville as an excellent or good place to raise children and 83% as a place to retire, both higher than national and custom and benchmarks.
- Overall quality of parks and recreation opportunities was also higher than the custom benchmark at 94% rating as excellent or good, along with recreation centers, availability of paths and walking trails, preservation of open space. 92% gave public library services high marks.
- In terms of safety, 91% rated their overall feeling of safety in Roseville as good or excellent, and the rating jumped to 97% for how safe residents feel in their neighborhood during the day. Fire services received a 97% rating for excellent or good quality.
- Looking at community design, Roseville ranked higher than the custom benchmark for overall appearance, well-designed neighborhoods, overall design and layout of residential and commercial areas, quality of new development, and for both well-planned residential and commercial growth.
- In the areas of mobility, Roseville ranked above the custom benchmark for ease of parking, ease of travel by bicycle, street lighting, street cleaning, sidewalk maintenance, traffic signal maintenance, traffic signal timing, bus or transit services, and street repair.
- The two areas across dozens of data points where Roseville ranked lower than the benchmark were using bus, rail or other public transportation instead of driving, and how important respondents felt it was in the next two years for the Roseville community to focus on residents' connection and engagement with their community.

Government performance was an area in which Roseville received among the highest rankings in the nation. Specifically for the value of services for taxes paid to Roseville, the overall direction that Roseville is taking, generally acting in the best interest of the community, treating residents with respect, treating all residents fairly, being honest, being open and transparent to the public, overall confidence in Roseville government, information residents about issues facing the community, and the job Roseville government does at welcoming resident involvement.

Breaking it down a little further[

Roseville residents enjoy a high quality of life, and the City's utilities contribute to the high marks.

Residents value the quality of life in Roseville, with 9 in 10 giving positive reviews to the City as a place to live and the overall quality of life in the community; these ratings were higher than the national benchmarks. Around 90% of respondents indicated they were either very likely or somewhat likely to remain in Roseville for the next five years and to recommend living in the City to someone who asks. The overall image or reputation of Roseville also received exceptional marks from 93% of community members and ranked above the national benchmark.

In addition to the high indicators of the quality of life, Roseville residents gave exceptional marks to utilities in the community. 97% of community members responded that the overall quality of the

utility infrastructure was excellent or good, while 92% stated similarly for storm water management, putting both items much higher than the national benchmarks. Over 90% of respondents gave positive marks to utility billing, drinking water, garbage collection, sewer services, and power (electric and/or gas) utility, all of which were higher than the national benchmark. Affordable high-speed internet access receive positive scores from about two-thirds of residents.

Community members are pleased with their local government.

Residents gave outstanding and above-average marks to almost every aspect of government performance in Roseville. About 9 in 10 respondents gave high marks to the overall quality of services provided by the City of Roseville as well as the overall customer service provided by Roseville employees. At least three-quarters of residents assigned positive reviews to the City treating residents fairly and with respect, being honest, and generally acting in the best interest of the community. About 77% of residents rated the value of services for the taxes paid to the City and the overall direction of Roseville as excellent or good. Being open and transparent to the public and the overall confidence in Roseville government scored similarly high marks (73% and 72%, respectively). Over 65% of respondents also gave excellent or good marks to the City informing residents about issues facing the community and the job Roseville does at welcoming resident involvement.

Resident's praise Roseville's economy.

Roseville's economy was an important and positively rated facet of the community. The City as a place to work scored much higher than the national benchmark, with 88% of respondents rating it excellent or good. About 9 in 10 residents gave high marks to the overall economic health of Roseville, and the quality of economic development and employment opportunities also received higher-than-average ratings from at least 7 in 10 residents. In addition, the City's shopping opportunities scored much higher than the benchmark (93% excellent or good). At least 8 in 10 respondents positively rated both the overall quality (93%) and variety (87%) of business and service establishments in Roseville.

Inclusivity and engagement scored on par with the nation in Roseville, but respondents indicated strong support for addressing homelessness in the community.

Items relating to inclusivity and engagement, like the sense of civic/community pride and acceptance of the community toward people of diverse backgrounds, were rated excellent or good by about 7 in 10 residents. Similar marks were given to the opportunities to volunteer and to participate in social events and activities. Community members also gave positive scores to the job the City does at making residents feel welcome (80%), valuing/respecting residents from diverse backgrounds (72%), and attracting people from diverse backgrounds (61%).

About 6 in 10 community members indicated that Roseville does an excellent or good job at taking care of vulnerable residents, including the homeless population. When asked other questions pertaining to addressing homelessness in the community, residents expressed strong overall support. While only 23% of residents indicated that homeless is a major or moderate problem in their neighborhood, 65% rated it a major or moderate problem within Roseville as a whole. Almost 8 in 10 residents considered it essential or very important for the City of Roseville to address the challenges of people experiencing homelessness in the community in some way. Residents rated the following approaches as essential or very important for the City to focus on: partnering with Placer County Social Services, non-profits, and health care providers that provide services to homeless individuals (82%), providing access to social services (80%), and creating affordable housing opportunities (62%). In addition, 78% of community members either strongly support or somewhat support the City providing supportive housing for people experiencing homelessness.

ENVIRONMENTAL REVIEW

The California Environmental Quality Act (CEQA) does not apply to activities that will not result in a direct or reasonably foreseeable indirect physical change in the environment, or is otherwise not considered a project as defined by CEQA Statute §21065 and CEQA State Guidelines §15060(c)(3) and §15378. The National Survey Report meets the above criteria and are not subject to CEQA. No additional environmental review is required.

About The NCS™

The National Community Survey™ (The NCS™) report is about the "livability" of Roseville. A livable community is a place that is not simply habitable, but that is desirable. It is not only where people do live, but where they want to live. The survey was developed by the experts at Polco's National Research Center.

Great communities are partnerships of the government, private sector, community-based organizations and residents, all geographically connected. The NCS captures residents' opinions considering ten central facets of a community:

- Economy
- Mobility
- Community Design
- Utilities
- Safety
- Natural Environment
- Parks and Recreation
- Health and Wellness
- Education, Arts, and Culture
- Inclusivity and Engagement

The report provides the opinions of a representative sample of 476 residents of the City of Roseville collected from January 19, 2021 to March 10, 2021. The margin of error around any reported percentage is 5% for all respondents and the response rate for the 2021 survey was 16%. Survey results were weighted so that the demographic profile of respondents was representative of the demographic profile of adults in Roseville.

How the results are reported

For the most part, the percentages presented in the following tabs represent the "percent positive." Most commonly, the percent positive is the combination of the top two most positive response options (i.e., excellent/good, very safe/somewhat safe, etc.). On many of the questions in the survey respondents may answer "don't know." The proportion of respondents giving this reply is shown in the full set of responses included in the tab "Complete data." However, these responses have been removed from the analyses presented in most of the tabs. In other words, the tables and graphs display the responses from respondents who had an opinion about a specific item.

Comparisons to benchmarks

NRC's database of comparative resident opinion is comprised of resident perspectives gathered in surveys from over 600 communities whose residents evaluated the same kinds of topics on The National Community Survey. The comparison evaluations are from the most recent survey completed in each community in the last five years. NRC adds the latest results quickly upon survey completion, keeping the benchmark data fresh and relevant. The communities in the database represent a wide geographic and population range. In each tab, Roseville's results are noted as being "higher" than the benchmark, "lower" than the benchmark or "similar" to the benchmark, meaning that the average rating given by Roseville residents is statistically similar to or different (greater or lesser) than the benchmark. Being rated as "higher" or "lower" than the benchmark means that Roseville's average rating for a particular item was more than 10 points different than the benchmark. If a rating was "much higher" or "much lower," then Roseville's average rating was more than 20 points different when compared to the benchmark.

The survey was administered during the COVID-19 pandemic, a time of challenge for many local governments. While we provide comparisons to national benchmarks, it is important to note that much of the benchmark data was collected prior to the pandemic. This may impact how your City's 2020 ratings compare to other communities' ratings from the past five years.

Methods

Selecting survey recipients

All households within the City of Roseville were eligible to participate in the survey. A list of all households within the zip codes serving Roseville was purchased from Go-Dog Direct based on updated listings from the United States Postal Service. Since some of the zip codes that serve the City of Roseville households may also serve addresses that lie outside of the community, the exact geographic location of each housing unit was compared to community boundaries using the most current municipal boundary file. Addresses located outside of the City of Roseville boundaries were removed from the list of potential households to survey. Each address identified as being within city boundaries was further identified as being within one of the five areas. From that list, addresses were randomly selected as survey recipients, with multi-family housing units (defined as those with a unit number) sampled at a rate of 5:3 compared to single family housing units.

An individual within each household was selected using the birthday method. The birthday method selects a person within the household by asking the "person whose birthday has most recently passed" to complete the questionnaire. The underlying assumption in this method is that day of birth has no relationship to the way people respond to surveys. This instruction was contained in the introduction of the survey.

Conducting the survey

The 3,000 randomly selected households received mailings beginning on January 19, 2021 and the survey remained open for seven weeks. For 1,500 households, the first mailing was a postcard inviting the household to participate in the survey. The next mailing contained a cover letter with instructions, the survey questionnaire, and a postage-paid return envelope. The final mailing contained a reminder letter, another survey, and a postage-paid return envelope. For the remaining 1,500 households, the first mailing was a postcard inviting the household to participate, followed one week later by a reminder postcard. All mailings included a web link to give residents the opportunity to respond to the survey online. All follow-up mailings asked those who had not completed the survey to do so and those who had already done so to refrain from completing the survey again.

The survey was available in English and Spanish. All mailings contained paragraphs in both languages instructing participants on how to complete the survey in their preferred language.

About 1% of the 3,000 mailed invitations or surveys were returned because the household address was vacant or the postal service was unable to deliver the survey as addressed. Of the remaining 2,972 households that received the invitations to participate, 476 completed the survey, providing an overall response rate of 16%. The response rates was calculated using AAPOR's response rate #2* for mailed surveys of unnamed persons.

It is customary to describe the precision of estimates made from surveys by a "level of confidence" and accompanying "confidence interval" (or margin of error). A traditional level of confidence, and the one used here, is 95%. The 95% confidence interval can be any size and quantifies the sampling error or imprecision of the survey results because some residents' opinions are relied on to estimate all residents' opinions. The margin of error for the City of Roseville survey is no greater than plus or minus five percentage points around any given percent reported for all respondents (476 completed surveys).

In addition to the randomly selected "probability sample" of households, a link to an online open participation survey was publicized by the City of Roseville. The open participation survey was identical to the probability sample survey with two small updates; it included a map at the beginning asking where the respondent lives and a question about where they heard about the survey. The open participation survey was open to all city residents and became available on February 23, 2021. The survey remained open for two weeks. The data presented in the following tabs exclude the open participation survey data, but a tab at the end provides the complete frequency of responses to questions by the open participation respondents.

Analyzing the data

Responses from mailed surveys were entered into an electronic dataset using a "key and verify" method, where all responses are entered twice and compared to each other. Any discrepancies were resolved in comparison to the original survey form. Range checks as well as other forms of quality control were also performed. Responses from surveys completed on Polco were downloaded and merged with the mailed survey responses.

The demographics of the survey respondents were compared to those found in the 2010 Census and 2017 American Community Survey estimates for adults in the City of Roseville. The primary objective of weighting survey data is to make the survey respondents reflective of the larger population of the community. The characteristics used for weighting were age, sex, race, Hispanic origin, housing type, housing tenure, and area. No adjustments were made for design effects. Weights were calculated using an iterative, multiplicative raking model known as the ANES Weighting Algorithm.* The results of the weighting scheme for the probability sample are presented in the following table.

NRC aligns demographic labels with those used by the U.S. Census for reporting purposes, when possible. Some categories (e.g., age, race/Hispanic origin, housing type, and length of residency) are combined into smaller subgroups.

		Unweighted	Weighted	Target*
Age	18-34	8%	27%	28%
	35-54	31%	36%	37%
	55+	61%	36%	36%
Area	District 1	16%	19%	19%
	District 2	18%	19%	19%
	District 3	20%	21%	21%
	District 4	22%	19%	19%
	District 5	24%	22%	22%
Hispanic origin	No, not Spanish, Hispanic, or Latino	88%	87%	87%
	Spanish, Hispanic, or Latino	12%	13%	13%
Housing tenure	Own	82%	65%	65%
	Rent	18%	35%	35%
Housing type	Attached	14%	24%	24%
	Detached	86%	76%	76%
Race & Hispanic origin	Not white alone	32%	28%	28%
	White alone, not Hispanic or Latino	68%	72%	72%
Sex	Female	53%	53%	53%
	Male	47%	47%	47%
Sex/age	Female 18-34	4%	14%	14%
	Female 35-54	18%	19%	19%
	Female 55+	30%	20%	20%
	Male 18-34	4%	14%	14%
	Male 35-54	14%	18%	18%
	Male 55+	29%	16%	16%

The survey datasets were analyzed using all or some of a combination of the Statistical Package for the Social Sciences (SPSS), R, Python and Tableau. For the most part, the percentages presented in the reports represent the "percent positive." The percent positive is the combination of the top two most positive response options (i.e., excellent/good, very safe/somewhat safe, essential/very important, etc.), or, in the case of resident behaviors/participation, the percent positive represents the proportion of respondents indicating "yes" or participating in an activity at least once a month.

On many of the questions in the survey respondents may answer "don't know." The proportion of respondents giving this reply is shown in the full set of responses included in the tab "Complete data". However, these responses have been removed from the analyses presented in the reports. In other words, the tables and graphs display the responses from respondents who had an opinion about a specific item.

Highlights

Roseville residents enjoy a high quality of life, and the City's utilities contribute to the high marks.

Residents value the quality of life in Roseville, with 9 in 10 giving positive reviews to the City as a place to live and the overall quality of life in the community; these ratings were higher than the national benchmarks. Around 90% of respondents indicated they were either very likely or somewhat likely to remain in Roseville for the next five years and to recommend living in the City to someone who asks. The overall image or reputation of Roseville also received exceptional marks from 93% of community members and ranked above the national benchmark.

In addition to the high indicators of the quality of life, Roseville residents gave exceptional marks to utilities in the community. 97% of community members responded that the overall quality of the utility infrastructure was excellent or good, while 92% stated similarly for storm water management, putting both items much higher than the national benchmarks. Over 90% of respondents gave positive marks to utility billing, drinking water, garbage collection, sewer services, and power (electric and/or gas) utility, all of which were higher than the national benchmark. Affordable high-speed internet access received positive scores from about two-thirds of residents.

Community members are pleased with their local government.

Residents gave outstanding and above-average marks to almost every aspect of government performance in Roseville. About 9 in 10 respondents gave high marks to the overall quality of services provided by the City of Roseville as well as the overall customer service provided by Roseville employees. At least three-quarters of residents assigned positive reviews to the City treating residents fairly and with respect, being honest, and generally acting in the best interest of the community. About 77% of residents rated the value of services for the taxes paid to the City and the overall direction of Roseville as excellent or good. Being open and transparent to the public and the overall confidence in Roseville government scored similarly high marks (73% and 72%, respectively). Over 65% of respondents also gave excellent or good marks to the City informing residents about issues facing the community and the job Roseville does at welcoming resident involvement. All of the aforementioned items scored higher than the national benchmarks.

When asked about their preferred methods for receiving news and information from the City, more than half of residents indicated they either strongly or somewhat preferred the City's website and email newsletters and around 32% of community members preferred mail. Social media platforms were less popular than other methods; the most preferred platform was Facebook at 25%, followed by Nextdoor (20%), Instagram (16%), and Twitter (10%). Similarly, fewer than 2 in 10 respondents indicated they either strongly or somewhat prefer community meetings or other methods.

Resident's praise Roseville's economy.

Roseville's economy was an important and positively rated facet of the community. The City as a place to work scored much higher than the national benchmark, with 88% of respondents rating it excellent or good. About 9 in 10 residents gave high marks to the overall economic health of Roseville, and the quality of economic development and employment opportunities also received higher-than-average ratings from at least 7 in 10 residents. In addition, the City's shopping opportunities scored much higher than the benchmark (93% excellent or good). At least 8 in 10 respondents positively rated both the overall quality (93%) and variety (87%) of business and service establishments in Roseville.

Inclusivity and engagement scored on par with the nation in Roseville, but respondents indicated strong support for addressing homelessness in the community.

Items relating to inclusivity and engagement, like the sense of civic/community pride and acceptance of the community toward people of diverse backgrounds, were rated excellent or good by about 7 in 10 residents. Similar marks were given to the opportunities to volunteer and to participate in social events and activities. Community members also gave positive scores to the job the City does at making residents feel welcome (80%), valuing/respecting residents from diverse backgrounds (72%), and attracting people from diverse backgrounds (61%).

About 6 in 10 community members indicated that Roseville does an excellent or good job at taking care of vulnerable residents, including the homeless population. When asked other questions pertaining to addressing homelessness in the community, residents expressed strong overall support. While only 23% of residents indicated that homeless is a major or moderate problem in their neighborhood, 65% rated it a major or moderate problem within Roseville as a whole. Almost 8 in 10 residents considered it essential or very important for the City of Roseville to address the challenges of people experiencing homelessness in the community in some way. Residents rated the following approaches as essential or very important for the City to focus on: partnering with Placer County Social Services, non-profits, and health care providers that provide services to homeless individuals (82%), providing access to social services (80%), and creating affordable housing opportunities (62%). In addition, 78% of community members either strongly support or somewhat support the City providing supportive housing for people experiencing homelessness.

Facets of livability

Resident perceptions of quality and importance for each of the facets of community livability provide an overview of community strengths and challenges that are useful for planning, budgeting and performance evaluation. The charts below show the proportion of residents who rated the community facets positively for quality and the priority (importance) placed on each. Also displayed is whether local ratings were lower, similar, or higher than communities across the country (the national benchmark).

Please rate each of the following characteristics as they relate to Roseville as a whole.
(% excellent or good)

		vs. benchmark*
Overall economic health of Roseville	90%	Higher
Overall quality of the transportation system (auto, bicycle, foot, bus) in Roseville	76%	Similar
Overall design or layout of Roseville's residential and commercial areas (e.g., homes, buildings, streets, parks, etc.)	78%	Higher
Overall quality of the utility infrastructure in Roseville (water, sewer, storm water, electric, gas)	97%	Much higher
Overall feeling of safety in Roseville	91%	Similar
Overall quality of natural environment in Roseville	87%	Similar
Overall quality of parks and recreation opportunities	94%	Higher
Overall health and wellness opportunities in Roseville	89%	Higher
Overall opportunities for education, culture, and the arts	69%	Similar
Residents' connection and engagement with their community	66%	Similar

Please rate how important, if at all, you think it is for the Roseville community to focus on each of the following in the coming two years.
(% essential or very important)

Overall economic health of Roseville	92%	Similar
Overall quality of the transportation system (auto, bicycle, foot, bus) in Roseville	76%	Similar
Overall design or layout of Roseville's residential and commercial areas (e.g., homes, buildings, streets, parks, etc.)	82%	Similar
Overall quality of the utility infrastructure in Roseville (water, sewer, storm water, electric, gas)	94%	Higher
Overall feeling of safety in Roseville	95%	Similar
Overall quality of natural environment in Roseville	85%	Similar
Overall quality of parks and recreation opportunities	84%	Similar
Overall health and wellness opportunities in Roseville	79%	Similar
Overall opportunities for education, culture, and the arts	71%	Similar
Residents' connection and engagement with their community	67%	Lower

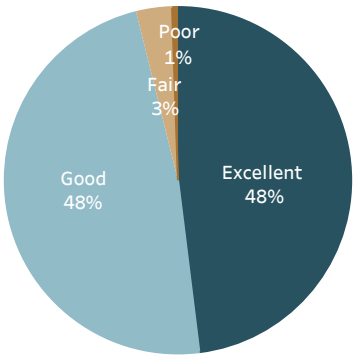
* Comparison to the national benchmark is shown. If no comparison is available, this is left blanC

Balancing performance and importance

Every jurisdiction must balance limited resources while meeting resident needs and striving to optimize community livability. To this end, it is helpful to know what aspects of the community are most important to residents and which they perceive as being of higher or lower quality. It is especially helpful to know when a facet of livability is considered of high importance but rated as lower quality, as this should be a top priority to address.

To help guide City staff and officials with decisions on future resource allocation, resident ratings of the importance of services were compared to their ratings of the quality of these services. To identify the services perceived by residents to have relatively lower quality at the same time as relatively higher importance, all services were ranked from highest perceived quality to lowest perceived quality and from highest perceived importance to lowest perceived importance. Some services were in the top half of both lists (higher quality and higher importance); some were in the top half of one list but the bottom half of the other (higher quality and lower importance or lower quality and higher importance); and some services were in the bottom half of both lists.

Services receiving quality ratings of excellent or good by 88% or more of respondents were considered of "higher quality" and those with ratings lower than 88% were considered to be of "lower quality." Services were classified as "more important" if they were rated as essential or very important by 83% or more of respondents. Services were rated as "less important" if they received a rating of less than 83%. This classification uses the median ratings for quality and importance to divide the services in half.



The quadrants in the figure below show which community facets were given higher or lower importance ratings (up-down) and which had higher or lower quality ratings (right-left). Services categorized as higher in importance and lower in quality may warrant further investigation to see if changes to their delivery are necessary.

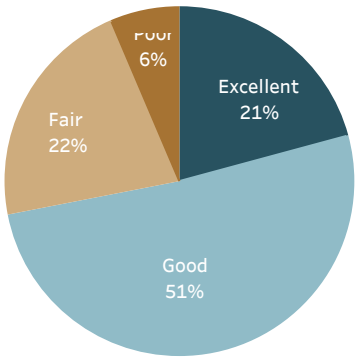
Quality of life

Measuring community livability starts with assessing the quality of life of those who live there, and ensuring that the community is attractive, accessible, and welcoming to all.

The overall quality of life in Roseville

Please rate each of the following aspects of quality of life in Roseville. (% excellent or good)		vs. benchmark*
Roseville as a place to live	97%	Higher
The overall quality of life in Roseville	96%	Higher

Please indicate how likely or unlikely you are to do each of the following. (% very or somewhat likely)		
Recommend living in Roseville to someone who asks	94%	Similar
Remain in Roseville for the next five years	84%	Similar



Please rate each of the following characteristics as they relate to Roseville as a whole. (% excellent or good)		
Overall image or reputation of Roseville	93%	Higher

* Comparison to the national benchmark is shown. If no comparison is available, this is left blank.

Governance

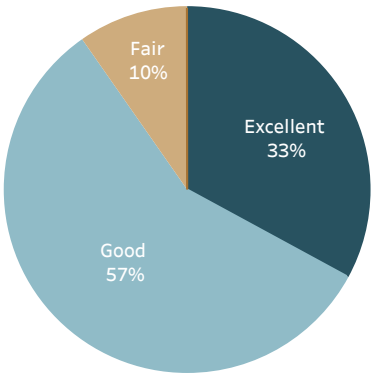
Strong local governments produce results that meet the needs of residents while making the best use of available resources, and are responsive to the present and future needs of the community as a whole.

Overall confidence in Roseville government

Please rate the quality of each of the following services in Roseville. (% excellent or good)		vs. benchmark*
Public information services	79%	Similar

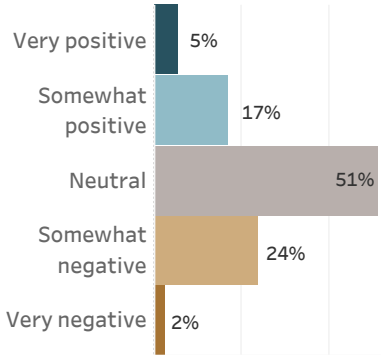
Please rate the quality of each of the following services in Roseville. (% excellent or good)		
Overall customer service by Roseville employees (police, receptionists, planners, etc.)	91%	Higher

Please rate the following categories of Roseville government performance. (% excellent or good)		
Treating residents with respect	84%	Higher
Treating all residents fairly	79%	Higher
The value of services for the taxes paid to Roseville	77%	Higher
The overall direction that Roseville is taking	77%	Higher
Generally acting in the best interest of the community	75%	Higher
Being honest	75%	Higher
Being open and transparent to the public	73%	Higher
Overall confidence in Roseville government	72%	Higher
Informing residents about issues facing the community	69%	Higher
The job Roseville government does at welcoming resident involvement	66%	Higher



Overall, how would you rate the quality of the services provided by each of the following? (% excellent or good)		
The City of Roseville	89%	Higher
The Federal Government	28%	Similar

*Comparison to the national benchmark is shown. If no comparison is available, this is left blank.



Economy

Local governments work together with private and nonprofit businesses, and with the community at large, to foster sustainable growth, create jobs, and promote a thriving local economy.

Overall economic health of Roseville

What impact, if any, do you think the economy will have on your family income in the next 6 months? Do you think the impact will be:

Please rate each of the following aspects of quality of life in Roseville.
(% excellent or good)

		vs. benchmark*
Roseville as a place to work	88%	Much higher
Roseville as a place to visit	73%	Similar

National benchmark tables

This table contains the comparisons of Roseville's results to those from other communities. The first column shows the comparison of Roseville's rating to the benchmark. Roseville's results are noted as being "higher", "lower" or "similar" to the benchmark, meaning that the average rating given by Roseville residents is statistically similar to or different than the benchmark. The second column is Roseville's "percent positive." Most commonly, the percent positive is the combination of the top two most positive response options (i.e., excellent/good). The third column is the rank assigned to Roseville's rating among communities where a similar question was asked. The fourth column is the number of communities that asked a similar question. The fifth column shows the percentile for Roseville's result -- that is what percent of surveyed communities had a lower rating than Roseville.

			% positive	Rank	Number of communities	Percentile

Custom benchmark tables

This table contains the comparisons of Roseville's results to those from other communities with similar population sizes, ranging from 100,000 to 200,000. The first column shows the comparison of Roseville's rating to the benchmark. Roseville's results are noted as being "higher", "lower" or "similar" to the benchmark, meaning that the average rating given by Roseville residents is statistically similar to or different than the benchmark. The second column is Roseville's "percent positive." Most commonly, the percent positive is the combination of the top two most positive response options (i.e., excellent/good). The third column is the rank assigned to Roseville's rating among communities where a similar question was asked. The fourth column is the number of communities that asked a similar question. The fifth column shows the percentile for Roseville's result -- that is what percent of surveyed communities had a lower rating than Roseville.

			% positive	Rank	Number of communities	Percentile

Complete set of frequencies

This dashboard contains a complete set of responses to each question on the survey. By default, "Don't know" responses are excluded, but may be added to the table using the response filter to the right. When a table for a question that only permitted a single response does not total to exactly 100%, it is due to the common practice of percentages being rounded to the nearest whole number.

Comparison of Responses by Respondent Characteristics

Responses have been summarized to show only the proportion of respondents giving a positive answer; for example, the percent of respondents who rated the quality of life as excellent or good.

In the "Statistical significance" tab, you will find a tool to help determine the threshold values for statistically significant differences between groups.

Statistical significance thresholds

Below you may select a demographic to find the thresholds for statistically significant differences between groups (i.e. the minimum difference between groups to be considered statistically significant based on the sample sizes). Use the drop down menu to the right to select demographic dimensions. If there were no responses within a specific demographic option, that option will not appear in the dashboard.

Methods (open participation)

As part of its participation in The National Community Survey™ (The NCS™), the City of Roseville conducted a survey of 3,000 residents. Survey invitations were mailed to randomly selected households and data were collected from January 19, 2021 to March 10, 2021. The results from this main survey effort represent the most robust estimate of your residents' opinions.

After the above data collection period was underway, a link to an online open participation survey was publicized by the City of Roseville. The open participation survey was identical to the probability sample survey with two small updates; it included a map at the beginning asking where the respondent lives and also a question about where they heard about the survey. The open participation survey was open to all city residents and became available on February 23, 2021. The survey remained open for two weeks and there were 853 responses.

The open participation survey data were not collected through a random sample and it is unknown who in the community was aware of the survey; therefore, a level of confidence in the representativeness of the sample cannot be estimated. However, to reduce bias where possible, these data were statistically weighted to match the demographic characteristics of the 2010 Census and 2017 American Community Survey estimates for adults in the City of Roseville. The characteristics used for weighting were age, area, sex, race, Hispanic origin, housing type, and housing tenure. No adjustments were made for design effects. Weights were calculated using an iterative, multiplicative raking model known as the ANES Weighting Algorithm.* The results of the weighting scheme for the probability sample are presented in the following table.

* Pasek, J. (2010). ANES Weighting Algorithm. Retrieved from https://web.stanford.edu/group/iriss/cgi-bin/anesrake/resources/RakingDescription.pdf

	Rent	11%	35%	35%

Open participation survey results

This dashboard contains a complete set of responses to each question on the open participation survey. By default, "don't know" responses are excluded, but may be added to the table using the response filter to the right. When a table for a question that only permitted a single response does not total to exactly 100%, it is due to the common practice of percentages being rounded to the nearest whole number.

Title:	City Policy on Display of Flags
Contact:	Dion Louthan 916-774-5362 dlouthan@roseville.ca.us

Meeting Date: 6/16/2021
Item #: 8.4.

RECOMMENDATION TO COUNCIL

Staff recommends the City Council consider the two proposed versions of a "City of Roseville Policy on Display of Flags" ("Flag Policy") and either adopt a resolution approving one of the two proposed Flag Policies or provide staff with further direction.

BACKGROUND

At the May 6, 2021, City Council meeting, the City Council discussed and directed staff to bring forward a policy on display of flags at City of Roseville ("City") owned properties for City Council's consideration. The City Council requested two versions of the policy. Specifically, they requested a version that memorialized the past practice ("Policy 1") and a version that would allow for display of a commemorative flag at City Council's sole direction ("Policy 2").

Flags and flagpoles owned or maintained by the City of Roseville are not intended to serve as a forum for free expression by the public, but rather are a non-public forum. The City has had a longstanding practice, but not a formal policy. A Flag Policy would outline an official policy for the display of any flag by the City and create an objective standard going forward.

Staff reviewed similar policies for the display of flags from several California cities. Many of the cities who adopted such policies are located in or adjacent to the Bay Area, however staff reviewed policies for cities around the State in order to have a broad sampling. The two proposed Flag Policy versions are based on policies from the cities of: Dublin, Elk Grove, Fountain Valley (Orange County), Pittsburg, San Pablo, San Ramon, South Lake Tahoe, Sunnyvale, and Tracy, and represent legally defensible and commonly accepted verbiage.

The term "commemorative flag" is the commonly used term to define any non-governmental flag (meaning not formally recognized nationally and congressionally as a governmental flag or associated with a local government). Additionally, neither Policy 1 nor Policy 2 apply to City-owned properties that are leased to third parties.

Policy 1- Memorializes Past Practice

Historically, the U.S. Flag, the California State Flag, and the City of Roseville Flag, or a combination thereof, have been displayed on the flagpoles at the Civic Center (both indoors and outdoors), as well as on other flagpoles located at other City owned properties, such as fire stations, the police department, parks, the corporation yard, and ball fields. This is consistent with both federal and state law (United States Code, Title 4, Ch. 1, et seq., and California Government Code sections 430 et seq.). Additionally, as part of the approved park design, the nationally and congressionally approved prisoner of war missing in action ("POW-MIA") flag is displayed at Veteran's Memorial Park-North and the Korean War Veteran's Memorial at Maidu Regional Park. The past practice of the City has been to only display those legally required and governmentally recognized flags at City owned properties. Policy 1 memorializes this past practice.

Policy 2- Allows "Commemorative Flags"

The proposed Policy 2 mirrors Policy 1 for all City owned properties, except at the outdoor flagpole located at the Civic Center (the corner of S. Grant and Vernon Streets). At this location, City Council can elect to display a commemorative flag in the position of lowest honor to the U.S. Flag, California State Flag, and, if displayed, the City of Roseville flag (this lowest position is required by law). The policy complies with state and federal laws and is structured in a manner that treats commemorative flags as government speech.

The policy prohibits third-party requests for commemorative flag displays and only allows for the display of commemorative flags when the request is brought forth by a member of the City Council and a majority of the City Council members agree to place the discussion on the agenda. The decision to display the commemorative flag must then be authorized by a majority vote of the City Council at a duly noticed regular or special City Council meeting, as an expression of the City Council's official sentiments.

Policy 2 also provides that any commemorative flag being considered must be consistent with the current City Council recognized goals and priorities and City strategic plan. Consistent with Federal and State law, Policy 2 makes clear that the following are not allowed as commemorative flags and will not be considered by the City Council:

i. Flags of a particular religious movement or creed, to avoid the appearance of City government endorsing religion or a particular religious movement or creed;

ii. Flags of a political party, to avoid the appearance of City government endorsing a political party; and

iii. Flags advocating a certain outcome in an election.

Policy 2 also makes clear that the City must obtain the commemorative flag itself.

FISCAL IMPACT

Adoption of Policy 1 will have no fiscal impact, as only legally required and governmentally recognized flags will be flown, and the costs of such flags are already provided for in the approved budget.

Adoption of Policy 2 will have a minimal fiscal impact associated with the City obtaining any

authorized commemorative flag. The costs are wholly dependent on the number of commemorative flags authorized by City Council and the costs for such flags, but given it is proposed at one location, it is anticipated to be very low.

ENVIRONMENTAL REVIEW

The California Environmental Quality Act (CEQA) does not apply to activities that will not result in a direct or reasonably foreseeable indirect physical change in the environment, or is otherwise not considered a project as defined by CEQA Statute §21065 and CEQA State Guidelines §15060(c)(3) and §15378.

The consideration and adoption of either proposed Flag Policy meets the above criteria and is not subject to CEQA. No additional environmental review is required.

Combined Display of Flag Policies Roseville

RESOLUTION NO. 21-283

ADOPTING A CITY OF ROSEVILLE POLICY ON DISPLAY OF FLAGS

WHEREAS, the City of Roseville currently displays, as required by existing law, the United States Flag, the State of California Flag, the City of Roseville Flag, and at two park memorial locations, the congressionally and nationally recognized prisoner of war missing in action "POW-MIA" Flag; and

WHEREAS, the City of Roseville does not have a formal policy regarding the display of flags; and

WHEREAS, at the May 5, 2021, City Council meeting, the City Council directed staff to prepare versions of a Policy on Display of Flags for the City Council to consider and adopt; and

WHEREAS, the City Council desires to establish a policy that provides guidance and standards for the indoor and outdoor display of flags at City of Roseville owned properties; and

WHEREAS, in adopting this Policy on Display of Flags, the City Council declares that flags and flagpoles owned or maintained by the City of Roseville are not intended to serve as a forum for free expression by the public, but rather as a nonpublic forum for the display of flags outlined in the Policy on Display of Flags, as an expression of the City Council's official sentiments (government speech).

NOW, THEREFORE, BE IT RESOLVED that the City Council of the City of Roseville approves the Policy on Display of Flags, attached and incorporated hereto as Exhibit A.

PASSED AND ADOPTED by the Council of the City of Roseville this____day of _____, 20_, by the following vote on roll call:

City Clerk

CITY OF ROSEVILLE POLICY ON DISPLAY OF FLAGS

The Roseville City Council (hereinafter "City Council") desires to establish a "Policy on Display of Flags" (hereinafter "Policy"). In adopting this Policy, the City Council declares that the City of Roseville's flagpoles are not intended to serve as a forum for free expression of the public, but rather for the display of Federal, State, and City of Roseville flags, consistent with applicable law and past practice.

I. Purpose

A. The purpose of this Policy is to establish clear guidance from the City Council regarding the indoor and outdoor display of flags at City of Roseville (hereinafter "City") owned properties.

B. In adopting this Policy, the City Council desires to memorialize the past practice of displaying only nationally and congressionally recognized flags, consistent with required law.

C. In adopting this Policy, the City Council declares that flagpoles owned or maintained by the City are not intended to serve as a forum for free expression by the public. Rather, such flagpoles are a non-public forum for the display of Federal, State, and City of Roseville flags, as authorized by this Policy, as an expression of the City Council's official sentiments (government speech).

D. The City will not display a commemorative flag based on a request from a third party, nor will the City use its flagpoles to sponsor the expression of a third party.

II. Policy

A. Conformance with Federal and State Regulations. Flags shall be displayed in accordance with all Federal and State statutes and regulations, including, but not limited to United States Code, Title 4, Chapter 1, et seq., and California Government Code sections 430 et seq., as may be amended from time to time, and this Policy.

B. For all City owned properties (including parks). If there is an outside flagpole, the United States Flag may be displayed and the State of California Flag may be displayed, as described in section II(A) above. The City of Roseville Flag may also be displayed from such flagpole. If flags are displayed indoors, those flags are limited to the United States Flag, State of California Flag, and City of Roseville Flag. Commemorative flags may not be displayed.

If such City owned property is leased or licensed to a third party, that third party shall not be bound by this Policy, but must comply with any Federal, State, or local laws related to display of flags.

In addition, Veteran's Memorial Park North and Maidu Regional Park, may

allow the display of the nationally and congressionally recognized prisoner-of-war/missing-in-action ("POW-MIA") flags. (See 36 U.S.C. § 902, Federal Public Law §116-67, Federal Public Law §94-344.)

III. **Procedures**

A. Consistent with section II(A), no other flag shall be placed above the United States Flag and no other flag shall be larger than the United States Flag.

B. Flags should be hoisted briskly and lowered ceremoniously. The United States Flag should be hoisted first and lowered last.

C. Flags shall be displayed during operating hours on all days on which the City is open for business, and on national and state holidays. Flags may be displayed twenty-four (24) hours a day as long as they are illuminated during darkness.

D. Flags shall not be displayed during inclement weather, unless all- weather flags are used and are illuminated during darkness.

E. When flags are displayed on a single pole, the order from top to bottom shall be: the United States Flag, the California State Flag, if displayed, the City of Roseville flag, and, if displayed, the POW-MIA flag.

F. When the flags are displayed from adjacent flag poles, the United States Flag shall be displayed at the highest point of honor. The California State Flag shall be placed in the second position of honor.

CITY OF ROSEVILLE POLICY ON DISPLAY OF FLAGS

The Roseville City Council (hereinafter "City Council") desires to establish a "Policy on Display of Flags" (hereinafter "Policy"). In adopting this Policy, the City Council declares that the City of Roseville's flagpoles are not intended to serve as a forum for free expression of the public, but rather for the display of Federal, State, and City of Roseville flags, and any "commemorative flag" as may be authorized by this Policy and the City Council as an expression of the City Council's official sentiments.

I. Purpose

A. The purpose of this Policy is to establish clear guidance from the City Council regarding the indoor and outdoor display of flags at City of Roseville (hereinafter "City") owned properties.

B. In adopting this Policy, the City Council declares that flagpoles owned or maintained by the City are not intended to serve as a forum for free expression by the public. Rather, such flagpoles are a non-public forum for the display of Federal, State, and City of Roseville flags, and any commemorative flag (as defined by section II(C)(1) below), as authorized by the City Council and this Policy as an expression of the City Council's official sentiments (government speech).

C. The City will not display a commemorative flag based on a request from a third party, nor will the City use its flagpoles to sponsor the expression of a third party.

II. Policy

A. Conformance with Federal and State Regulations. Flags shall be displayed in accordance with all Federal and State statutes and regulations, including, but not limited to United States Code, Title 4, Chapter 1, et seq., and California Government Code sections 430 et seq., as may be amended from time to time, and this Policy.

B. For all City owned properties (including parks), other than the Civic Center, located at 311 Vernon Street, Roseville. If there is an outside flagpole, the United States Flag may be displayed and the State of California Flag may be displayed, as described in section II(A) above. The City of Roseville Flag may also be displayed from such flagpole. If flags are displayed indoors, those flags are limited to the United States Flag, State of California Flag, and City of Roseville Flag. Commemorative flags may not be displayed.

If such City owned property is leased and/or licensed to a third party, that third party shall not be bound by this Policy, but must comply with any Federal, State, or local laws related to display of flags.

In addition, Veteran's Memorial Park North and Maidu Regional Park, may allow the display of the nationally and congressionally recognized prisoner-of-

war/missing-in-action ("POW-MIA") flags. (See 36 U.S.C. § 902, Federal Public Law §116-67, Federal Public Law §94-344.)

C. Civic Center, located at 311 Vernon Street, Roseville. Regarding the flagpole outside of the Civic Center, located on the corner of Vernon Street and S. Grant Street, the United States Flag shall be displayed and the State of California Flag shall be displayed, as described in section II(A) above. The City of Roseville Flag may also be displayed from such flagpole, as well as a "commemorative flag" (as defined by section II(C)(1)). If flags are displayed indoors of the Civic Center, those flags are limited to the United States Flag, State of California Flag, and City of Roseville Flag.

1. Commemorative Flag

a. As expression of the City's official government speech, the City Council may authorize the display of a "commemorative flag" to be displayed below any other flags on the Civic Center flagpole, located on the corner of Vernon Street and S. Grant Street. Only commemorative flags that comply with this Policy may be displayed.

b. A commemorative flag is any flag that is consistent with this Policy and not the United States Flag, State of California Flag, City of Roseville Flag, and/or the nationally and congressionally recognized POW-MIA flag.

c. The City Council shall only consider a request to display such a commemorative flag if the request is made by a member of the City Council and a majority of the City Council members agree to place the discussion on the agenda for a regular or special City Council meeting. Requests to display a commemorative flag by members of the public will not be considered.

d. A majority of the City Council must agree to display the commemorative flag as part of an official City Council action at a duly noticed, Ralph M. Brown Act compliant, regular or special City Council meeting.

e. Commemorative flags shall be displayed for a period of time that is reasonable or customary for the subject that is to be commemorated, but no longer than thirty-one (31) continuous days.

f. If any other flag is displayed at half-staff, the commemorative flag will also be displayed at half-staff, height limits permitting.

g. A commemorative flag will only be considered by the City Council if it is commonly identified with, and consistent with, the current City Council recognized goals and priorities and City strategic plan. The following are not allowed as commemorative flags and will not be considered by the City Council:

i. Flags of a particular religious movement or creed, to avoid the

appearance of City government endorsing religion or a particular religious movement or creed;

ii. Flags of a political party, to avoid the appearance of City government endorsing a political party; and

iii. Flags advocating a certain outcome in an election.

h. Any approved commemorative flag will be obtained by the City.

III. **Procedures**

A. Consistent with section II(A), no other flag shall be placed above the United States Flag and no other flag shall be larger than the United States Flag.

B. Flags should be hoisted briskly and lowered ceremoniously. The United States Flag should be hoisted first and lowered last.

C. Flags shall be displayed during operating hours on all days on which the City is open for business, and on national and state holidays. Flags may be displayed twenty-four (24) hours a day as long as they are illuminated during darkness.

D. Flags shall not be displayed during inclement weather, unless all- weather flags are used and are illuminated during darkness.

E. When flags are displayed on a single pole, the order from top to bottom shall be: the United States Flag, the California State Flag, if displayed, the City of Roseville Flag, if displayed the POW-MIA flag, and if displayed and allowed by this Policy, the commemorative flag.

F. When the flags are displayed from adjacent flagpoles, the United States Flag shall be displayed at the highest point of honor. The California State Flag shall be placed in the second position of honor.

COUNCIL COMMUNICATION

CC #: 1555
File #: 0201 & 0103-03-02 & 0103-29-02

Title:	FY2021-22 Citywide Budget, Position Allocation Schedule, Housing Authority Budget and Roseville Finance Authority Budget
Contact:	Scott Pettingell 916-774-1306 spettingell@roseville.ca.us

Meeting Date: 6/16/2021
Item #: 9.1.

RECOMMENDATION TO COUNCIL

Adopt: 1) an ordinance approving the proposed FY2021-22 citywide budget, and approve out-of-state travel requests, new vehicle requests, and the citywide position allocation schedule as incorporated into the FY2021-22 budget document, effective July 1, 2021; 2) a resolution approving the Roseville Housing Authority budget for FY2021-22; and 3) a resolution approving the Roseville Finance Authority budget for FY2021-22.

BACKGROUND

CITYWIDE BUDGET

Fiscal Summary: The FY2021-22 proposed expenditure/expense budget totals approximately $571 million from all funding sources. The total expense budget for the General Fund is approximately $182 million, which includes operating ($176 million) and non-operating ($6 million). The General Fund budget is balanced with revenues equal to expenses.

Positions: Following is a summary of position allocation changes included in the FY2021-22 proposed budget. The proposed budget includes a net increase of 40.25 positions to address critical service level requirements. These positions are recommended to address current workload demands, comply with increased regulations, and increase service levels in high-priority areas. The following table summarizes the recommended positions by Department.

Department	Positions
Total Current Citywide Positions	1,220.23
City Manager	1.00
Development Services	2.00
Economic Development	1.00
Electric	5.00
Environmental Utilities	13.00
Human Resources	1.00

Parks, Recreation & Libraries	9.00
Police	3.00
Public Works	5.25
Total Position Changes	40.25
Total Citywide Positions in FY2021-22 Budget	**1,260.48**

In addition, the citywide position allocation schedule is incorporated into the FY2021-22 budget document.

City Council Goals: The following City Council goals guided the budget process. The FY2021-22 budget document highlights the budget augmentations, City services, and performance measures that align with these goals.

- Remain fiscally responsible in a changing world
- Support community engagement and advocacy
- Maintain a safe and healthy community
- Enhance economic vitality
- Deliver exceptional city services
- Invest in well-planned infrastructure and growth

Measure B: The proposed budget includes $21 million in Measure B local sales tax revenues. These revenues continue to allow the City to maintain current service levels, restore services, and strategically invest in high-priority areas while still achieving a balanced budget.

Process: The proposed budget is the result of an extensive process that included a City Council strategic planning workshop, budget development updates, a utilities budget update, a Capital Improvement Program budget overview, financial policies update, and a budget hearing.

Outreach: The budget process included a public outreach effort that involved publishing budget information on the city website, including the budget in brief document, e-newsletters, and social media.

General Fund Stabilization Reserve: The FY2020-21 budget assumed that the General Fund would require $2.1 million from this fund to balance the budget. Stronger than anticipated property and sales tax indicate that this transfer will not be necessary. The FY2021-22 budget includes a transfer of approximately $2.5 million from the General Fund into the Stabilization Reserve to bring the total reserve balance to $23.8 million. The $23.8 million, in addition to the $2.1 million in additional resources mentioned above, will bring the total balance of this reserve to $25.9 million or 15 percent of the General Fund operations budget. The purpose of the General Fund Stabilization Reserve Fund is to allow time for the City to restructure its operations deliberately as required in an economic downturn to minimize service disruption.

General Fund Emergency Reserve: The FY2021-22 budget includes a transfer of approximately $1.2 million from the General Fund into the Emergency Reserve to bring the total reserve balance to $17.3 million or 10 percent of the General Fund budget before transfers to reserves. The purpose of this reserve is to have the ability to fund significant short-term issues such as expenditures during declared emergencies should the need arise.

Budget Ordinance: The annual budget ordinance includes the following modifications:

- Section 3.4 – Adjusted section clarifying that the City Manager and Assistant City Manager/Chief Financial Officer must ensure that the budget complies with City Council approved financial policies.
- Section 3.5 – Added section authorizing the City Manager or designee to increase the Fiscal Year 2021-22 budget for the remaining unspent appropriations from the prior fiscal year for City Council approved fleet replacement.

- Section 3.6 & 3.7 – Added language clarifying that Capital and Non-Capital project appropriations shall solely be used for the original purpose approved by the City Council.
- Section 3.8 – Added language to require City Council approval to establish a new Capital Improvement Project or Non-Capital Improvement project or cancel a project (without completion).
- Section 3.10 – Adjusted language to clarify process to close completed or inactive projects. .
- Section 3.16 – Adjusted section to require that staff seek City Council approval for all changes to the citywide budget, except as otherwise authorized in the annual budget ordinance.

ROSEVILLE HOUSING AUTHORITY BUDGET

The Roseville Housing Authority (RHA) was formed in October 1974 and administers the Housing Choice Voucher (HCV) Program which provides rental assistance for low-income residents in order to access quality, affordable, and safe housing. RHA ensures housing stability and economic self-sufficiency for up to 735 families, seniors, disabled persons, and veterans annually. Rental assistance for income-qualified participants is paid directly to property owners who participate in the HCV Program. The Housing Authority receives funding from the Federal Department of Housing and Urban Development (HUD). Roseville's HCV program infuses over $6.5 million of federal funds into the local economy each year including administration revenue which covers most of the staff costs to administer the program.
RHA is a separate legal entity from the City; and therefore its budget is approved by its Board of Directors who are represented by the City Council. Activities related to administering the program are performed by City employees who charge a majority portion of their time to the program. Financial activities are audited annually as part of the City-wide audit; and its financial statements are included in the City of Roseville's annual comprehensive financial report.
Budget Analysis: RHA has one fund that accounts for its activities with revenues and expenditures presented in the attached Fund Summary (Attachment B) which also includes its restricted and unrestricted fund balances. The detail for the FY2021-22 revenues and expenditures are presented in the Budget Item Detail (Attachment A) and are further discussed below. RHA has budgeted $5,634,072 for housing assistance payments revenue (HAP) for all vouchers. When a participating household finds rental housing that meets program requirements, written agreements are signed between the owner, tenant and RHA, outlining their respective rights and responsibilities. Program participants pay a share of the rent based on their household income, and RHA pays a calculated amount of rental assistance directly to the property owner each month.

Rental Assistance Programs & Family Self-Sufficiency Funding/Revenue – Administration
RHA administers Regular, Non-Elderly Disabled (NED), Veterans Affairs Supportive Housing (VASH), Mainstream and Project-Based Vouchers. Each year, the Housing Authority also participates in HUD's Family Self-Sufficiency (FSS) Program, which enables families assisted through the HCV Program to increase their earned income and reduce their dependency on state and federal assistance and rental subsidies. In this program, participants elect to divert a portion of their housing assistance payments to an interest-bearing account. During their participation in the FSS program, participants set goals to decrease their dependency on rental assistance. Once participants complete the required objectives of their program plan, they can access the savings account and use the funds for a variety of needs, such as a down-payment on a house, a car, education loans, or other items that further their self-sufficiency goals. HUD awards FSS grants to Housing Authorities who compete for the funding. The FSS funding for FY2021-22 of $72,000 offsets a portion of the salaries and benefits of the program coordinator and other staff who help administer the program.

Administrative and Other Miscellaneous Revenues
RHA earns administrative revenues based on the number of vouchers that have been leased up. The estimated revenues total $744,711. RHA also administers a portion of the HCV Program for tenants that live in the City of Rocklin and charges the City of Rocklin a minimum administrative fee in order to recoup costs for this service. The administrative fee budgeted for FY2021-22 is $27,500 and is based on an existing agreement with Rocklin. Interest, Portability Billing and Fraud Recovery is estimated to be $7,950 for a total of $780,161.

Personnel and other Administrative Costs
The following table illustrates the estimated revenues and estimated expenditures needed to successfully run the HCV program in FY2021-22. Materials, services, supplies and indirect costs total $175,890 and salaries, wages and benefits are $680,290 for a total of $856,180. The difference between the costs and the revenues are covered by the General Fund. This difference is 10% of the total administrative costs, as shown below:

HAP Admin funds earned from projected lease-ups	$672,711
FSS Administrative funds	$72,000
Other Revenues (Rocklin, Repayments and Interest)	$35,450
Total Available Revenues & Resources	**$780,161**
Materials, Services, Supplies & Indirects	$175,890
Salaries, Wages & Benefits	$680,290
Total Administrative Costs	**$856,180**
Variance = Costs covered by the City's General Fund	**$76,019**

The 10% contribution from the City's General Fund (16% in FY2020-21) is the difference between the Housing Authority's administrative revenues and the costs to run the program on an annual basis. The funds needed to run the program effectively are not currently available from HUD due to their annual proration policies. This contribution from the General Fund provides a guarantee that the HCV program can continue to provide rental assistance to very low-income families in Roseville and Rocklin.

ROSEVILLE FINANCE AUTHORITY BUDGET

Debt service payments of $2,377,289 reflect scheduled payments on the Certificates of Participation (COPs) for the Corporation Yard and 316 Vernon Street. The Authority has issued other bonds and COPs, but that debt service is reflected in the City's budget within each respective fund. For community facilities district (CFD) bond issues, the Authority acts as a conduit to collect payments through the County property tax levy process for the repayment of outstanding debt of these special districts.
Transfers out of the Roseville Finance Authority Capital Projects Fund of $414,351 represents funding transferred to the Citywide Parks Fund for the repayment of a loan from the Fleet Replacement Fund which funded a portion of the construction of Harry Crabb Park.
The Roseville Finance Authority budget for FY2021-22 is available in attached C.

FISCAL IMPACT

The FY2021-22 citywide budget document provides a financial summary for each City fund, department, capital improvement project, and non-capital multi-year project.

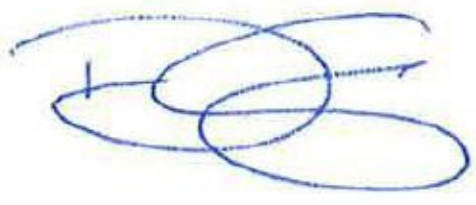
Attachments A and B provide financial summaries of the FY2021-22 Roseville Housing Authority budget.

Attachment C provides a financial summary of the FY2021-22 Roseville Finance Authority budget.

ENVIRONMENTAL REVIEW

The California Environmental Quality Act (CEQA) does not apply to activities that will not result in a direct or reasonably foreseeable indirect physical change in the environment, or is otherwise not considered a project as defined by CEQA Statute §20165 and CEQA State Guidelines §15060(c)(3) and §15378.

Adoption of the: 1) FY2021-22 citywide budget and approval of out-of-state travel requests, new vehicle requests, and the citywide position allocation schedule; 2) FY2021-22 Roseville Housing Authority budget; and 3) FY2021-22 Roseville Finance Authority budget meet the above criteria and are not subject to CEQA. No additional environmental review is required.



CITY COUNCIL STRATEGIC PLAN/OVERARCHING GOALS

Adoption of the City's FY2021-22 Budget provides policy direction and legal appropriation authority to continue efforts to accomplish City Council's strategic plan goals.

ORDINANCE NO. 6375

ORDINANCE OF THE COUNCIL OF THE CITY OF ROSEVILLE
ADOPTING THE ANNUAL BUDGET FOR THE FISCAL YEAR 2021-2022,
ADOPTING BUDGET CONTROL POLICIES, ADOPTING AN APPROPRIATIONS LIMIT,
ADOPTING THE BUDGET FOR THE SUCCESSOR AGENCY OF THE ROSEVILLE
REDEVELOPMENT AGENCY, TO BE EFFECTIVE IMMEDIATELY
AS AN URGENCY MEASURE

THE CITY OF ROSEVILLE ORDAINS:

SECTION 1. The proposed budget for the City of Roseville entitled "Proposed Budget Fiscal Year 2021-2022, City of Roseville, California," a copy of which is on file in the office of the City Clerk, is hereby adopted as the "Annual Budget Fiscal Year 2021-2022, City of Roseville, California."

SECTION 2. The proposed expenses, expenditures, transfers out, revenues, and transfers in shown in the fund, department operating budget and project summaries of the budget document, which are incorporated herein, are hereby appropriated to the departments and activities in the amounts and purposes therein stated. Encumbrances, expenses and expenditures of the various appropriations described in the budget document shall be made by those departments and employees designated therein as the requisitioning authorities.

SECTION 3. The following budget control policies shall become effective upon the adoption of this ordinance:

1. The operating budget of the City of Roseville and the Successor Agency of the Roseville Redevelopment Agency shall be approved by the following major expenditure/expense summary categories:
    a. Salaries and Wages
    b. Benefits
    c. Materials, Supplies, and Services
    d. Internal Reimbursements
    e. Capital Outlay
    f. Debt Service
    g. Transfers Out

2. The City Manager or designee shall apply prudent monitoring procedures to assure that actual expenditures/expenses of the City and the Successor Agency of the Roseville Redevelopment Agency do not exceed the appropriations at the department level by fund.

3. The City Council delegates authority to the City Manager or designee to approve the movement of City Council approved appropriations within the same fund, excluding Capital Improvement and Non-Capital Multiyear Projects.

4. The City Manager and Assistant City Manager/Chief Financial Officer are directed to ensure that the budget complies with City Council approved financial policies.

5. The City Manager or designee is authorized to increase the Fiscal Year 2021-22 budget appropriations for the remaining unspent appropriations from the prior fiscal year for City Council approved fleet replacement.

6. Capital Improvement Plan. The Capital Budget of the City of Roseville and the Successor Agency of the Roseville Redevelopment Agency shall be approved by Capital Improvement Project. Capital project appropriations shall be used solely for the original purpose approved by the City Council.

7. Non-Capital Multiyear Projects. The non-capital multiyear project budget for the City of Roseville and the Successor Agency of the Roseville Redevelopment Agency shall be approved by Non-Capital Multiyear Project. Non-Capital project appropriations shall be used solely for the original purpose approved by the City Council.

8. City Council approval is required to establish or cancel (without completion) new Capital Improvement Projects or Non-Capital Multi-Year Projects.

9. The City Manager or designee is authorized to carryover any unspent appropriations in Capital and Non-Capital Multi-Year Improvements Projects.

10. Annually, completed or inactive Capital Improvement Projects and Non-Capital Multi-Year Improvement Projects will be closed, except for projects that have existing litigation, payment disputes or other extenuating circumstances. An inactive project is defined as one where transaction activity is less than $1,000 over the prior three years. Closures are the responsibility of the designated project manager. The managing department and the City Manager or designee have the authority to take the necessary steps to close completed or inactive projects, including appropriate decreases to the budget.

11. All encumbrances for valid purchase orders and contracts in effect as of June 30, 2021, will remain in effect in the following fiscal year. The City Manager or

designee is authorized to increase the Fiscal Year 2021-22 budget appropriations in the amount of the outstanding encumbrances for valid purchase orders and contracts as of June 30, 2021.

12. The City Manager or designee is authorized to eliminate funds as required for proper accounting and fiscal management when the purpose of a fund has expired and its fund balance has been expended.

13. The City Manager is authorized to revise any appropriation made in the Adopted Budget where the revision does not increase total appropriations by fund and is consistent with City Council intent.

14. The City Manager is authorized to increase appropriations in any department or project from the General Fund Administrative Contingency.

15. The City Manager is authorized to increase appropriations in the Environmental Utilities funds from the respective fund's contingency budget.

16. All increases and decreases to the total adopted budget require City Council approval, except as otherwise authorized in this Ordinance.

17. The City Manager is authorized to refine/add content, as may be needed to meet Government Finance Officers Association (GFOA) and California Society of Municipal Finance Officers (CSMFO) budgeting award requirements, in the Proposed Budget to create the FY2021-22 Approved Budget.

SECTION 4. Pursuant to Article XIII B of the California Constitution, the appropriations limit for the City of Roseville is hereby established in the FY2021-22 Approved Budget. The State Department of Finance provides the City the annual adjustment factors used in the appropriation limit calculation. The factors are the changes in the California Per Capita Personal Income and population levels for the City or the County.

SECTION 5. It is hereby ordered that a copy of this ordinance and the budget document be certified by the City Clerk and filed in the office of the City Clerk. The City Clerk is directed to post a copy of this ordinance in three (3) conspicuous locations in the City and enter the posting thereof in the Ordinance Book.

SECTION 6. This ordinance is required for the orderly operation and maintenance of municipal activities and the appropriations for usual and current expenses of the City and the Successor Agency of the Roseville Redevelopment Agency during the 2021-2022 fiscal year. Therefore, this ordinance shall take effect immediately upon passage hereof as an urgency ordinance, pursuant to Section 5.03 of the Charter of the City of Roseville.

COUNCIL COMMUNICATION

CC #: 1549
File #: 0800-02

Title:	Draft 2020 Urban Water Management Plan – Public Hearing for Review and Receive Comments
Contact:	Trevor Joseph 916-746-1708 tjoseph@roseville.ca.us

Meeting Date: 6/16/2021
Item #: 10.1.

RECOMMENDATION TO COUNCIL

Staff recommends City Council hold a public hearing to review and receive comments on the Draft 2020 Urban Water Management Plan (UWMP). If found acceptable, as part of a separate agenda item, staff recommend City Council consider adoption of the UWMP and adopt a resolution including providing authorization to staff to submit the UWMP to the California Department of Water Resources (DWR) as final.

It is staff's recommendation that this agenda item should be considered with and presented concurrently with other agenda items, specifically to conduct a public hearing to review and hear comments and consider the adoption of a Draft Water Shortage Contingency Plan (WSCP). The WSCP ultimately is included in Chapter 8 of the UWMP, but must be presented and considered separately. For this reason, the public hearing and consideration of adoption of the Draft WSCP and consideration of adoption of the Draft 2020 UWMP have been placed as separate agenda items as documented in separate Council Communications (CC).

Staff recommend ordering these items as follows:

1. **Public Hearing – Draft 2020 UWMP (described within this CC)**
2. Public Hearing – Draft WSCP (described within a separate CC)
3. Adoption Hearing – Draft WSCP (described within a separate CC)
4. Adoption Hearing – Draft 2020 UWMP (described within a separate CC)

Specifically these public hearings allow for 1) community input regarding the urban retail water supplier's implementation for complying with the requirements of the California Water Code (CWC), 2) consider the economic impacts of the urban retail water supplier's implementation plan for complying with the CWC, and 3) City provided information on their baseline values, water use targets and compliance, and implementation plan.

After the public hearing, the UWMP may be adopted as prepared or as modified after the hearing or hearings at City Council direction.

BACKGROUND

Beginning in 1985, DWR has required water purveyors delivering water to at least 3,000 customers to prepare an UWMP and update the plan at five-year intervals. The last plan was developed and approved for 2015 and included all City boundaries as they existed at that time.

With ongoing and recent updates to the DWR Guidebook for Urban Water Suppliers, it was determined that City staff would collaborate with a consultant, Waterworks Engineers, Inc., on the development of the 2020 document update. Effort began in December 2020 with collection of significant quantity of information, continuing through a staff review process, and resulting in the proposed plan.

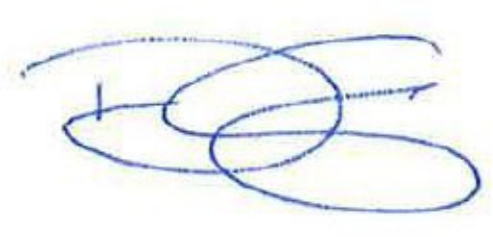
Following the severe drought of 2012-2016, the State of California Legislature sought to expand the water shortage contingency analysis under former law and mandated that a WSCP be adopted by suppliers. The California Water Code recognizes WSCPs as a critical tool during a drought emergency and grants that the State defer to locally adopted WSCPs, to the extent practicable.

FISCAL IMPACT

Conservation programs are a condition of City water contracts, regional agreements, and a matter of State law with the passage of SB X7-7 in 2009. Planning continues to be done on an annual basis and is included in all rate analyses and proposed budgets.

ENVIRONMENTAL REVIEW

The proposed activity is statutorily exempt from the California Environmental Quality Act (CEQA). CEQA does not apply to the preparation and adoption of Urban Water Management plans (California Water Code §10652). The proposed plan would not affect water supplies for fish and wildlife, or expand or add water supplies, and therefore no further environmental review is required.



CITY COUNCIL STRATEGIC PLAN/OVERARCHING GOALS

Goal F - Invest in well-planned infrastructure and growth

Respectfully Submitted,

Trevor Joseph, Hydrogeologist

Richard Plecker, Environmental Utilities Director

Dominick Casey, City Manager

Executive Summary

ES. 1 Introduction

An Urban Water Management Plan (UWMP) is the legal and technical water management foundation for suppliers throughout California. A UWMP combines information from various sources that inform water supply and demand such as projects pertaining to local land use planning, regional water supply, infrastructure, and demand management. The City of Roseville Water Utility (City) participates in UWMP updates every five years, as required by law. Each UWMP update addresses all requirements pertaining to urban retail water suppliers in accordance with the Urban Water Management Planning Act and the Water Conservation Act of 2009, also referred to as Senate Bill X7-7 (SB X7-7). Information contained in this 2020 UWMP includes the component listed in the following section.

ES. 2 Plan Components

The plan consists of the following components:

- **Chapter 1:** The basis for preparing a plan and the new requirements.
- **Chapter 2:** Summary of how the plan is prepared and coordination with the public and other local and regional authorities.
- **Chapter 3:** A description of the City's treatment facilities and distribution infrastructure, as well as a description of the population and area served by the City.
- **Chapter 4:** Quantification of water use for the 5-years preceding the plan update and water use projections for a 20-year planning horizon.
- **Chapter 5:** Supporting data for compliance with SB X7-7.
- **Chapter 6:** Description of existing and planned water supplies and water supply management.
- **Chapter 7:** A drought risk assessment (DRA), which analyzes water supplies and demands in a single year or multiple years of a water shortage.
- **Chapter 8**: The Water Shortage Contingency Plan (WSCP), which outlines the process that the City will execute in the event of a water shortage.
- **Chapter 9:** Demand measures that the City integrates and plans to integrate into its regular operations to address increasing demands.
- **Chapter 10:** Record of the process by which the UWMP was adopted, submitted, and implemented with the intention of making the plan widely available to the City's customers and the public.

ES. 3 Basis for Plan Preparation and Coordination

Urban water retail suppliers (suppliers) who either deliver 3,000-acre feet (AF) or more of water or have over 3,000 service connections are required to submit a UWMP. In 2020 the City had 46,112 service connections and supplied a total of 31,896 AF to its customers and therefore is required to prepare and submit an UWMP.

In preparation of the UWMP the City coordinated with the U.S. Bureau of Reclamation (USBR), Placer County Water Agency (PCWA), and San Juan Water District (SJWD), all of which supply water to the city on a wholesale basis. The City also actively sought involvement from the public and other local water agencies. Neighboring water retail suppliers and the community were informed of a public hearing to be held June 16, 2021. In this public

hearing the plan will be presented, and attendees are encouraged to share questions and concerns prior to the presentation of the UWMP in the City Council meeting which will be held on June 16, 2021, during which the plan will be adopted.

ES. 4 System and Supply Description

Raw water from Folsom Lake, the City's primary water source, is conveyed to the City's water treatment plant located in the Granite Bay area and is then distributed through the City's 600 miles of water mains to customers. Other water facilities that the City maintains include potable water storage tanks, pump stations, interties to exchange water with other water agencies, and groundwater wells.

The City receives its contract supplies purchased from USBR, PCWA, and SJWD through Folsom Reservoir. The City currently has 8 wells, 6 of which are in service, and is planning to expand their groundwater program as a means to having a more robust water supply available in the event of a water shortage condition. The City is also considering contract amendments with water agencies that would increase overall water supply resilience.

ES. 5 Past and Projected Water Use

The City supplies water to customers for the following water use sectors:

- Commercial
- Industrial
- Institutional and Governmental
- Multi-Family Residential
- Single Family Residential
- Landscape

The UWMP characterizes water use by sector for the years preceding the plan update as well as projections of water use for the next 25 years. Projections in the 2020 UWMP differ significantly from 2015 projections as a result of the rapid development pace observed in Roseville since the last plan update. When the 2015 UWMP was prepared the City of Roseville's General Plan anticipated that buildout of planned development would be reached in 2065. The City of Roseville updated the General Plan in August 2020 and current estimations, reflecting the pace of development, now indicate buildout of planned development will be complete by 2035. The City has taken a long-term approach to its overall water strategy planning and has planned for a population of up to 198,000 for 2035. The actual volume of water used by each sector for 2020 and updated water use projections through the year 2045 are summarized in ES Table 1.

ES Table 1 Actual 2020 Water Use and Projected Water Use through the Year 2045.

Water Use Sector	2020	2025	2030	2035	2040	2045
Commercial	2,630	6,135	6,508	7,017	7,017	7,017
Industrial	254	4,175	4,726	5,123	5,123	5,123
Institutional/ Governmental	412	8,904	9,494	10,321	10,321	10,321
Multi-Family	1,416	1,752	2,029	2,725	2,725	2,725
Single Family	17,115	22,564	24,508	26,281	26,281	26,281
Landscape	6,422	644	765	805	805	805
Losses	1,600	1,429	1,401	1,587	1,587	1,587
Groundwater recharge	597	1,560	2,720	3,350	3,350	3,350
Total	**30,445**	**47,163**	**52,151**	**57,210**	**57,210**	**57,210**
NOTES: All values are in AF/yr. Values represent potable water use only.						

ES. 6 SB X7-7

SB X7-7 called for a 20% reduction of water use from all retail water suppliers by the year 2020. In the 2015 UWMP the City calculated a 10-year and 5-year baseline period to determine an average baseline gallon per capita per day (GPCD) water use. This baseline demand was calculated to be 309 GPCD in accordance with the SB X7-7 standard methods. The 2020 target compliance water demand was 247 GPCD, a 20% reduction of the baseline. In 2020 the average demand for the City was 203 GPCD, which represents an approximately 34% reduction of the baseline demand. As such, the City is compliant with SB X7-7.

ES. 7 Supply Reliability and Drought Risk Assessment and Water Shortage Contingency Plan

A supply reliability and drought risk assessment were performed. The assessments considered the supply available for a single-year and five-year consecutive drought period for both the near-term and long-term. The supply availability was compared to the total water use to determine if a deficit is projected for any of the conditions. The supply availability is subject to seasonal and climatic shortages and so in a dry or critically dry years increasing limitations are placed on the City for volume of water that they receive from Folsom Lake. The supply and drought risk assessment demonstrated that there may be minor deficits in supply versus demand conditions under certain drought related circumstances. These minor shortages may occur in the near-term extended drought scenario as well as over the longer term for both extended and single year drought conditions. The highest level of deficiency identified represents less than 8% of the annual demand and can be remedied by the simple application of basic conservation measures, estimated to achieve 13% savings. The results of the drought risk assessment are summarized in ES Table 2.

ES Table 2 Near-Term and Long-Term Drought Risk Assessment Summary

Drought Type Assessed	Deficit Range	Description of Anticipated Deficit
Near-Term 5 Consecutive Dry Years	1,647	Deficit Expected in fifth year only
Long-Term Single Dry Year	1,647 – 1,824	Deficit expected in 2025-2045
Long-Term 5 Consecutive Dry Years	7 – 4,904	Deficit expected in fourth year for 2025-2045
	1,647 – 1,824	Deficit expected in fifth year of drought for 2025-2045
NOTES: All values are in AF/yr.		

To mitigate the projected deficits in a water shortage, a Water Shortage Contingency Plan (WSCP) was prepared. The WSCP outlines the procedures that the City will take annually to determine whether there will be a water deficit based on projected water demand and supply availability. If a deficit is anticipated the City will formally declare a water shortage emergency condition of varying levels dependent on the severity of the deficit. The declaration of the water shortage emergency condition will trigger a set of demand reduction actions that is to be carried out by the City and all water users. These demand reduction actions are set forth in the Roseville Municipal Code Chapter 14.09 Water Conservation and Drought Mitigation Ordinance. The legal authority of the City to enforce compliance with the demand reduction actions is granted by the Water Conservation and Drought Mitigation Ordinance.

ES. 8 Demand Management Measures

Aside from the demand reduction actions of the Water Conservation and Drought Mitigation Ordinance, the City has taken a proactive approach to managing demand under normal conditions as well. Demand management measures include accurate metering through a meter retrofit program which was implemented from 2001 to 2011, public education and outreach, and regional rebate programs for efficient water use fixtures. System losses, typically losses due to leaks in the pipe network, can account for a significant portion of water demand. The City continues to be proactive in its approach to address leaks in the system and reduce the overall losses, including an active acoustic leak detection program to identify and repair leaks throughout the distribution system, working to reduce overall system losses.

ES. 10 Plan Adoption and Submittal

The 2020 UWMP will be presented to City Council on June 16, 2021 for adoption. The 2020 UWMP will subsequently be submitted to the California Department of Water Resources for compliance with the Urban Water Management Planning Act. Copies of the plan have been made publicly available at the City's offices and an electronic version is also available for review and download on the City's website: www.roseville.ca.us/UWMP.

Chapter 1 Urban Water Management Plan Purpose and Description

This chapter introduces the Urban Water Management (UWMP) including legislation requiring urban water retail suppliers to submit UWMPs, necessary information required to be reported in the 2020 UWMP, an overview of the changes to legislation since the 2015 City of Roseville UWMP, and a description of benefits to the supplier and its customers in completing a UWMP.

1.1 California Legislation

The Urban Water Management Planning Act was enacted in 1983 by the State of California Legislature (Legislature). The law established the requirement that an urban water supplier (supplier), providing municipal water to over 3,000 customers or 3,000 acre-feet (AF) annually, adopt an UWMP every five years. The aim of the Urban Water Management Planning Act was to address declarations and findings of the California Water Code (CWC):

California Water Code Section 10610.2

(a) The Legislature finds and declares all of the following:

(1) The waters of the state are a limited and renewable resource subject to ever-increasing demands.

(2) The conservation and efficient use of urban water supplies are of statewide concern; however, the planning for that use and the implementation of those plans can best be accomplished at the local level.

(3) A long-term, reliable supply of water is essential to protect the productivity of California's businesses and economic climate, and increasing long-term water conservation among Californians, improving water use efficiency within the state's communities and agricultural production, and strengthening local and regional drought planning are critical to California's resilience to drought and climate change.

(4) As part of its long-range planning activities, every urban water supplier should make every effort to ensure the appropriate level of reliability in its water service sufficient to meet the needs of its various categories of customers during normal, dry, and multiple dry water years now and into the foreseeable future, and every urban water supplier should collaborate closely with local land-use authorities to ensure water demand forecasts are consistent with current land-use planning.

(5) Public health issues have been raised over a number of contaminants that have been identified in certain local and imported water supplies.

(6) Implementing effective water management strategies, including groundwater storage projects and recycled water projects, may require specific water quality and salinity targets for meeting groundwater basins water quality objectives and promoting beneficial use of recycled water.

(7) Water quality regulations are becoming an increasingly important factor in water agencies' selection of raw water sources, treatment alternatives, and modifications to existing treatment facilities.

(8) Changes in drinking water quality standards may also impact the usefulness of water supplies and may ultimately impact supply reliability.

(9) The quality of source supplies can have a significant impact on water management strategies and supply reliability.

Additionally, efforts aimed at protecting California's water supply were expanded in 2009 with Senate Bill X7-7 (SB X7-7), where Governor Schwarzenegger called for a 20% reduction statewide in per capita water use by 2020.

1.2 Updates to 2020 UWMP

Since the reporting of the 2015 UWMP, there have been various requirements added by the Legislature to the CWC. Subsequent chapters of this report will provide necessary information to address requirements applicable to the City. The major new requirements are described in the following sections.

1.2.1 Lay Description

Pursuant to Section 10630.5, all plans are now required to include a lay description. This description shall include how much water the City has on a reliable basis, anticipated demands for the foreseeable future, the City's plan to meet those future demands, any challenges that the City will face in the future, and other information that will provide the public with an understanding of the City's 2020 UWMP.

The requirement for this lay description is met in the executive summary.

1.2.2 Water Loss Reporting

Pursuant to Section 10631(d)(3)(C), the 2020 UWMP shall include past water loss for the 5-years preceding the plan. The 2015 UWMP included water loss data from 2015 only.

1.2.3 Energy Use Information

Pursuant to 10631.2, the 2020 UWMP shall include any information related to the amount of energy consumed in various water processed to estimate the energy intensity.

1.2.4 Groundwater Supplies Coordination

Pursuant to 10631(b)(4)(A), if groundwater is identified as a source of water available to the supplier the 2020 UWMP shall coordinate with the current version of any groundwater sustainability plan adopted pursuant to 10720, Sustainable Groundwater Management Act, or any other authority for groundwater management for basins underlying the service area.

1.2.5 Five Consecutive Dry-Year Water Reliability Assessment

Pursuant to 10631(f), suppliers must now include a description of actions they will implement for a period of drought lasting five consecutive water years as opposed to the 2015 UWMP requirement, which was for multiple dry water years.

1.2.6 Drought Risk Assessment

Pursuant to 10635(b), all suppliers are required to include a drought risk assessment (DRA) in the UWMP. Interim updates to the DRA may be conducted by the supplier within the five-year cycle of the UWMP update.

1.2.7 Water Shortage Contingency Plan

Pursuant to Section 10632, every urban water supplier shall prepare and adopt a water shortage contingency plan (WSCP). The WSCP shall be included in the 2020 UWMP but is to be adopted separate from the UWMP with the intent that it be updated as needed independently of the UWMP.

1.2.8 Seismic Risk

Pursuant to 10632.5, suppliers shall include a seismic risk assessment and mitigation in the UWMP to assess vulnerabilities of the supplier's facilities. The seismic risk assessment and mitigation plan shall be updated when the UWMP is updated.

1.3 Benefits of UWMP Reporting

UWMP reporting for the City is required by the state and is a critical document for ensuring that the City remains compliant with various regulations. Additionally, completion of a UWMP demonstrating that the City addresses the requirements of the CWC is necessary to be eligible for any Department of Water Resources (DWR) administered grant or loan. Completion of the most recent UWMP may also be required for other state funding.

Beyond establishing grant or loan eligibility the UWMP is intended to be a useful tool for the supplier and the public. Thoughtful preparation of the plan provides the supplier an opportunity for forward thinking and planning, ensuring that their water supply remains robust in the future and continues to meet the dynamic needs of its customers. Throughout plan preparation the City, other suppliers, and local and regional authorities are encouraged to coordinate with one another creating a greater understanding of the region's water demands, ultimately promoting mindful utilization of the state's water resources.

1.4 Plan Organization

This UWMP was prepared in part by use of guidance issued by DWR via the *Urban Water Management Plan Guidebook 2020* (Guidebook). Organization of the plan chapters closely follows the suggested organization in the Guidebook. Where appropriate, submittal tables provided by DWR are used to report data; these tables are denoted by the suffix, "DWR Table". Additional data reporting is done in City of Roseville Tables denoted by the suffix, "COR Table".

Chapter 2 Plan Preparation

This chapter provides an overview of the process by which the plan was prepared and the coordination that was carried out.

2.1 Basis for Preparing a Plan

The City of Roseville Water Utility (City) is a public water system (PWS), which is a system that provides drinking water for human consumption through pipes or other constructed conveyances. The City serves over 3,000 customers and delivers over 3,000 AF annually and as such is required to submit a UWMP. Metrics for total number of customers and volume of water supplied in the City's service area for 2020 are provided in DWR Table 2-1. The UWMP is required to be reviewed and updated every five years; preparation of this UWMP is an update to the most recent UWMP, adopted by the City of Roseville in 2016. As a water retail supplier, the City is also required to comply with the requirements of SB X7-7. This UWMP establishes the City's compliance with the Urban Water Management Planning Act and SB X7-7.

DWR Table 2-1

Submittal Table 2-1 Retail Only: Public Water Systems			
Public Water System Number	Public Water System Name	Number of Municipal Connections 2020	Volume of Water Supplied 2020
3110008	City of Roseville	46,112	30,445
	TOTAL	46,112	30,445
NOTES: All volumes are in AF. Units of measure remain consistent throughout the UWMP as reported in DWR Table 2-3.			

2.2 Individual or Regional Planning and Compliance

The CWC provides mechanisms for participating in area-wide regional, watershed or basin-wide urban water management planning. Per *Department of Water Resources Methodologies for Calculating Baseline and Compliance Urban Per Capita Water Use* (DWR Methodologies), water suppliers who receive water from a shared wholesale supplier may form a regional alliance. Although the City and its neighboring water suppliers practice regional water supply planning, the City has not formed a regional alliance with other water suppliers for compliance with SB X7-7. The City has prepared an individual UWMP, reporting solely on its own distribution service area and will not adopt a Regional Urban Water Management Plan (RUWMP), stated in DWR Table 2-2.

DWR Table 2-2

Submittal Table 2-2: Plan Identification			
Select Only One	**Type of Plan**		**Name of RUWMP or Regional Alliance** *if applicable*
☑	**Individual UWMP**		
	☐	Water Supplier is also a member of a RUWMP	
	☐	Water Supplier is also a member of a Regional Alliance	
☐	**Regional Urban Water Management Plan (RUWMP)**		

2.3 Fiscal or Calendar Year and Units of Measure

General metrics for plan preparation are provided in DWR Table 2-3.

DWR Table 2-3

Submittal Table 2-3: Supplier Identification	
Type of Supplier (select one or both)	
☐	Supplier is a wholesaler
☑	Supplier is a retailer
Fiscal or Calendar Year (select one)	
☑	UWMP Tables are in calendar years
☐	UWMP Tables are in fiscal years
If using fiscal years provide month and date that the fiscal year begins (mm/dd)	
Units of measure used in UWMP (select from drop down)	
Unit	AF

2.4 Coordination and Outreach

This section discusses the City's coordination with other agencies and the public.

2.4.1 Wholesale and Retail Coordination

Pursuant to CWC Section 10631(j) the City is to coordinate with wholesale supply agencies that provide the City with water. The City has water supply contracts with Placer County Water Agency (PCWA), San Juan Water District (SJWD), and the U.S. Bureau of Reclamation (USBR). As a retail supplier the City has informed the three agencies

of projected water use in five-year increments for the next 20 years. Documentation of this coordination is provided in Appendix A. DWR Table 2-4 lists those three agencies that the City has coordinated with.

DWR Table 2-4

Submittal Table 2-4 Retail: Water Supplier Information Exchange
The retail Supplier has informed the following wholesale supplier(s) of projected water use in accordance with Water Code Section 10631.
Wholesale Water Supplier Name
U.S. Bureau of Reclamation
Placer County Water Agency
San Juan Water District

2.4.2 Coordination with Other Agencies and the Community

The City has actively sought to coordinate preparation of the UWMP with local and regional agencies and the general public. The City recognizes that how it currently utilizes and plans to utilize its water supply affects not only its own customers, but customers served by neighboring water agencies and individuals or groups that rely on private wells. As the City is dedicated to the responsible and sustainable management of local and regional water resources it has invited participation from the agencies listed in COR Table 2-A. Documentation of this coordination is provided in Appendix B. On February 16, 2021, the City noticed the neighboring cities and counties that preparation of the 2020 UWMP update had begun. Additionally, the City will hold a public hearing on June 16, 2021 to introduce the 2020 UWMP to the public and solicit feedback and answer questions regarding the plan.

COR Table 2-A Outreach with Local and Regional Agencies

Agency Name	Agency Type
U.S. Bureau of Reclamation	Wholesale Supplier
Placer County Water Agency	Water Supplier
San Juan Water District	Water Supplier
California American Water	Water Supplier
Citrus Heights Water District	Water Supplier
Sacramento Municipal utility District	Water Supplier
Sacramento Suburban Water District	Water Supplier
City of Roseville, City Manager	Local City
Placer County Public Works Department	Local County
Placer County Community Development Resource Agency	Local County
Regional Water Authority Sacramento	Regional Organization

Chapter 3 System Description

This chapter provides a description of the system including information on the distribution system; service area boundary; service area climate; service area population, demographics, and socioeconomics; and land uses within the service area.

3.1 General Description

The City of Roseville Water Utility (City) is a public utility owned and operated by the City of Roseville, which is on the interstate 80 corridor, approximately 15 miles northeast of downtown Sacramento California. The City obtains its surface water from Folsom Lake through wholesale purchase primarily from the United States Bureau of Reclamation (USBR) and additional water contracts with Placer County Water Agency (PCWA) and San Juan Water District (SJWD). The City also maintains and operates several production well sites that provide additional water supply reliability to the City with plans to construct more.

3.1.1 Transmission

The City has a diversion capacity of 150 cubic feet per second (cfs) or 96 million gallons per day (MGD) at Folsom Dam. From the pump station raw water is conveyed through parallel pipelines; the original 84-inch diameter pipeline constructed at the same time as the pump station and a 72-inch diameter pipeline completed in 2010 as a joint effort between the City and other water purveyors. The common facilities split at the "Hinkel Y", and thereafter raw water is conveyed through parallel pipelines – a 60-inch diameter pipeline and a 48-inch diameter pipeline – to the City's water treatment plant.

3.1.2 Water Treatment

The City's single water treatment plant (WTP), located within the City but in the Granite Bay area, has a capacity of 100 MGD. There are no plans to expand the WTP as the WTP is sized just above the pumping capacity of the Folsom Dam pump station. The WTP is a conventional treatment plant. The treatment processes include flocculation and sedimentation, clarification, filtration, and disinfection. The treatment train, beginning with the intake at Folsom Lake, is shown in Figure 3-1.

Sedimentation takes place in three parallel clarifiers. The chemicals injected as part of the flocculation and sedimentation processes are caustic soda, alum, and a cationic polymer. Sedimentation takes place in three separate parallel clarifiers. There are 12 anthracite sand filters, which combined have a maximum filtration rate of about 83,000 gallons per minute (gpm). The clear wells have a total volume of 358,500 gallons. Disinfection is achieved using sodium hypochlorite. The City also adds fluoride to treated water at a concentration of 0.7 parts per million (ppm) prior to distribution.

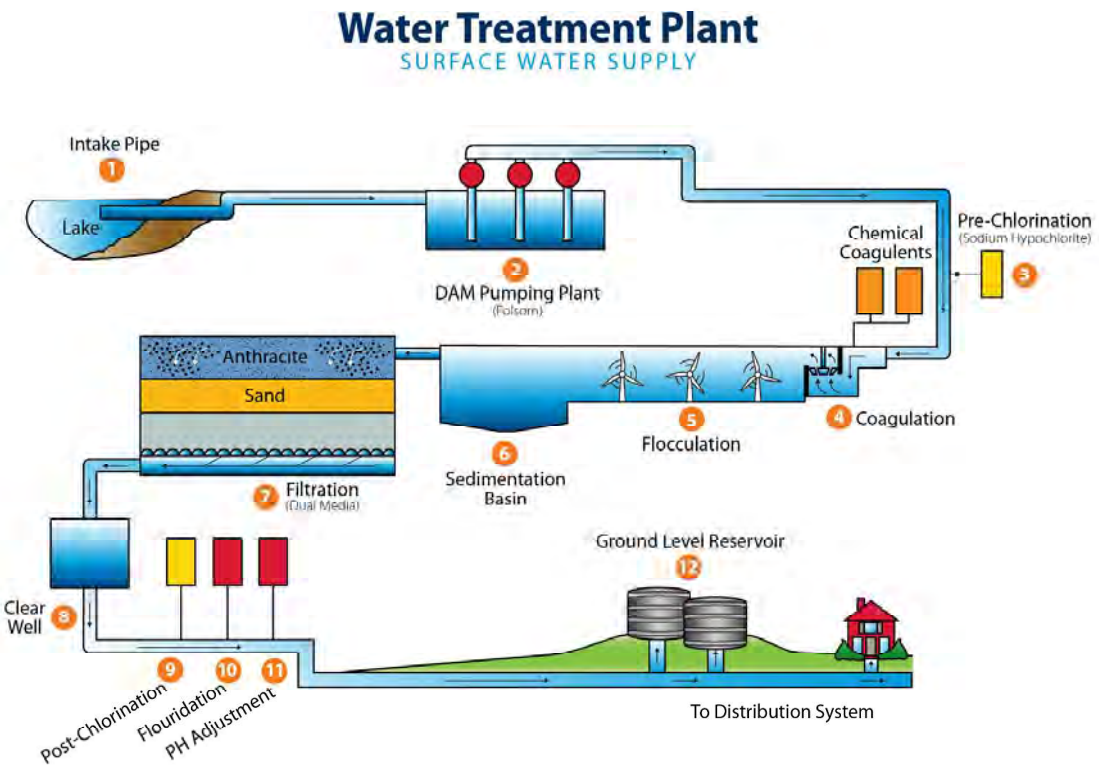

Figure 3-1. City of Roseville Water Treatment Plant Treatment Train

3.1.3 Storage

The City currently utilizes 6 potable water storage tanks, which are critical for maintaining water supply and system pressure during typical demand fluctuations, peak demand fluctuations, and emergency demands. The six water storage tanks have a total nominal capacity of 32 million gallons (MG). The City is also actively constructing two additional water storage tanks which will add a combined capacity of 12 MG, bringing the total storage capacity to 44 MG. The capacity of each tank is listed in COR Table 3-A.

COR Table 3-A Potable Water Storage Tanks

Facility	Existing or Future	Year Constructed	Type	Pressure Zone Served	Capacity (MG)
WTP	Existing	1971	Steel	1, 2, 4, 5	2
WTP	Existing	1990	Pre-Stressed Concrete	1, 2, 4, 5	4
WTP	Existing	2004	Pre-Stressed Concrete	1, 2, 4, 5	6
Northeast	Existing	1998	Pre-Stressed Concrete	1, 2, 4, 5	10
Northeast	Existing	2009	Pre-Stressed Concrete	1, 2, 4, 5	7.25
Halverson	Existing	2008	Pre-Stressed Concrete	2	2.9
West Side	Future	2022	Pre-Stressed Concrete	4	12

3.1.4 Distribution Network

The City maintains a distribution network consisting of approximately 600 miles of pressure pipe ranging from 1 inch to 72 inches in diameter. The network of pipe delivers potable water from the WTP to the City's customers to meet water demands during average day, maximum day, and peak hour conditions. The City aims to operate its system at a minimum pressure of 50 pounds per square inch (psi). Under existing conditions, the City mostly meets the minimum pressure criterion, with few instances where the minimum criteria are not met. These instances are not considered to be significant enough to impact the quality of customer's water service.

There are several specific plans for the City of Roseville which are in the process of being developed or will be developed in coming years. The City will serve these customers through new facilities which were designed during project development and that will be constructed by the developer and incorporated into the City's distribution network. The West Side Tank site will include a pump station with a pumping capacity of 20 MGD at the end of this construction phase, which is anticipated to be completed in 2022, but is designed to have a maximum capacity of 26.6 MGD at buildout. The existing and planned pump stations are summarized in COR Table 3-B.

COR Table 3-B Potable Water Pump Stations

Facility	Existing or Future	Pressure Zone Served
Dual Purpose Pump Station	Existing	1, 2
Highland Reserve North Pump Station	Existing	5
Pleasant Grove Pump Station	Existing	1
Pacific Fruit Express (PFE) Pump Station	Existing	Emergency Intertie
West Side Pump Station	Future	4

3.1.5 Groundwater Wells

The City currently operates 6 groundwater wells, which have a combined capacity of approximately 17,500-acre feet per year (AF/yr) or 15.6 MGD. Capacities of each operational well site are listed in COR Table 3-C. During the 2015 drought the water level in Folsom Lake was the lowest on record, which resulted in fluctuations in water supply. Consequently, the City sought to expand the existing ground water supply program to decrease reliability on Folsom Lake and to provide flexibility. To do so the City plans to utilize Aquifer Storage and Recovery (ASR) technology. ASR is the recharge of water in an aquifer through specially designed groundwater wells and recovery of water from that same well or others after time has passed. During times when there are excess surface water supplies, surface water can be injected using the ASR production wells and extracted during dry periods or when additional surface water is needed for the environment or other beneficial needs. Four of the existing operational wells have ASR capabilities, and the City plans to construct 6 additional wells with ASR capabilities by 2035.

COR Table 3-C Existing Operational Wells

Facility	Install/Rehab Date	Well Depth (Feet)	Zone Served	Pumping Capacity (MGD)
Darling Way, No. 4	1958/ 1999	303	1	1.3
Oakmont, No. 5	1978/ 1999	360	1	2.1
Diamond Creek, No. 6	2002	460	4	4.0
Woodcreek North, No. 7	2008	440	1	2.2
Hayden Parkway, No. 8	2015	520	4	3.1
Blue Oaks Boulevard, No. 12	2015	490	4	3.2

3.1.6 Interties

There are 17 interties with the surrounding jurisdictions of PCWA, SJWD, California-American Water Company (Cal-Am), Citrus Heights Water District (CHWD), and Sacramento Suburban Water District (SSWD). Each intertie is listed in COR Table 3-D.

COR Table 3-D Interties with Neighboring Water Suppliers

Intertie Agency	Facility	Year Constructed	Operational Control Agency	Control Valve Size (Inches)	Agency Receiving Water	Avg. Days/ Yr. Utilized 2015-2020	Days Utilized 2020
SJWD	WTP	1996	Roseville	16	Roseville	>1	0
	Eureka	1999	Roseville	12	Roseville	0	0
	Cavitt Stallman	1999	Roseville	12	Roseville	0	0

3.1.6.1 San Juan Water District Interties

The three interties that exist between the City and SJWD under normal operations remain closed and are only intended for emergency use. The intertie at the WTP delivers water from SJWD to the City only. The Eureka and Cavitt Stallman interties deliver water to and from the City.

3.1.6.2 Placer County Water Agency Interties

All interties between the City and PCWA, except for the Bianchi estates intertie, can deliver water into the City. The Highland Park and Pleasant Grove interties cannot deliver water from the City to PCWA, but the other four remaining interties can. Through these interties a maximum of 11.5 MGD can be delivered to the City and 12.0 MGD can be delivered to PCWA. Three of the six PCWA interties under normal operations remain opened. The Stoneridge intertie regularly pumps water from the City to PCWA. The Bianchi Estates intertie is regularly kept open as it feeds PCWA's Bianchi Estates system and is the only source of supply for that area. The Industrial- Tinker intertie is normally open in order to deliver water from PCWA to Cal-Am through the Crowder and PFE interties.

3.1.6.3 California American Water Company Intertie

Only the PFE intertie can deliver water to the City and is intended for emergency use with a maximum capacity of 3.5 MGD. Both the Crowder intertie and Vineyard interties cannot deliver water to the city. All three interties can deliver water from the City to Cal-Am and are normally open with a total maximum capacity of 8.35 MGD. The water that is delivered to the Crowder and Vineyard Rd interties is from the PCWA Tinker intertie.

3.1.6.4 Citrus Heights Water District

The three interties between the City and CHWD can all be used to deliver water to and from the City. All three are intended for emergency use and under normal operating conditions remain closed.

3.1.6.5 Sacramento Suburban Water District Intertie

The intertie between the City and SSWD is part of regional development of conjunctive use programs. During an emergency or drought years, the PFE pump station will pump water from SSWD's service area into zone 1 of the City. Likewise, this intertie can be used to deliver water from the City to SSWD. A mutual aid agreement between the City and SSWD is currently being developed.

3.2 Service Area

The City's service area boundary lies within the limits of the City of Roseville. There are a few small areas within the city limits that are served by PCWA, SJWD, and CHWD. The service area is approximately 3,150 acres (ac). The service area and the facilities mentioned in section 3.1 are shown in Figure 3-2.

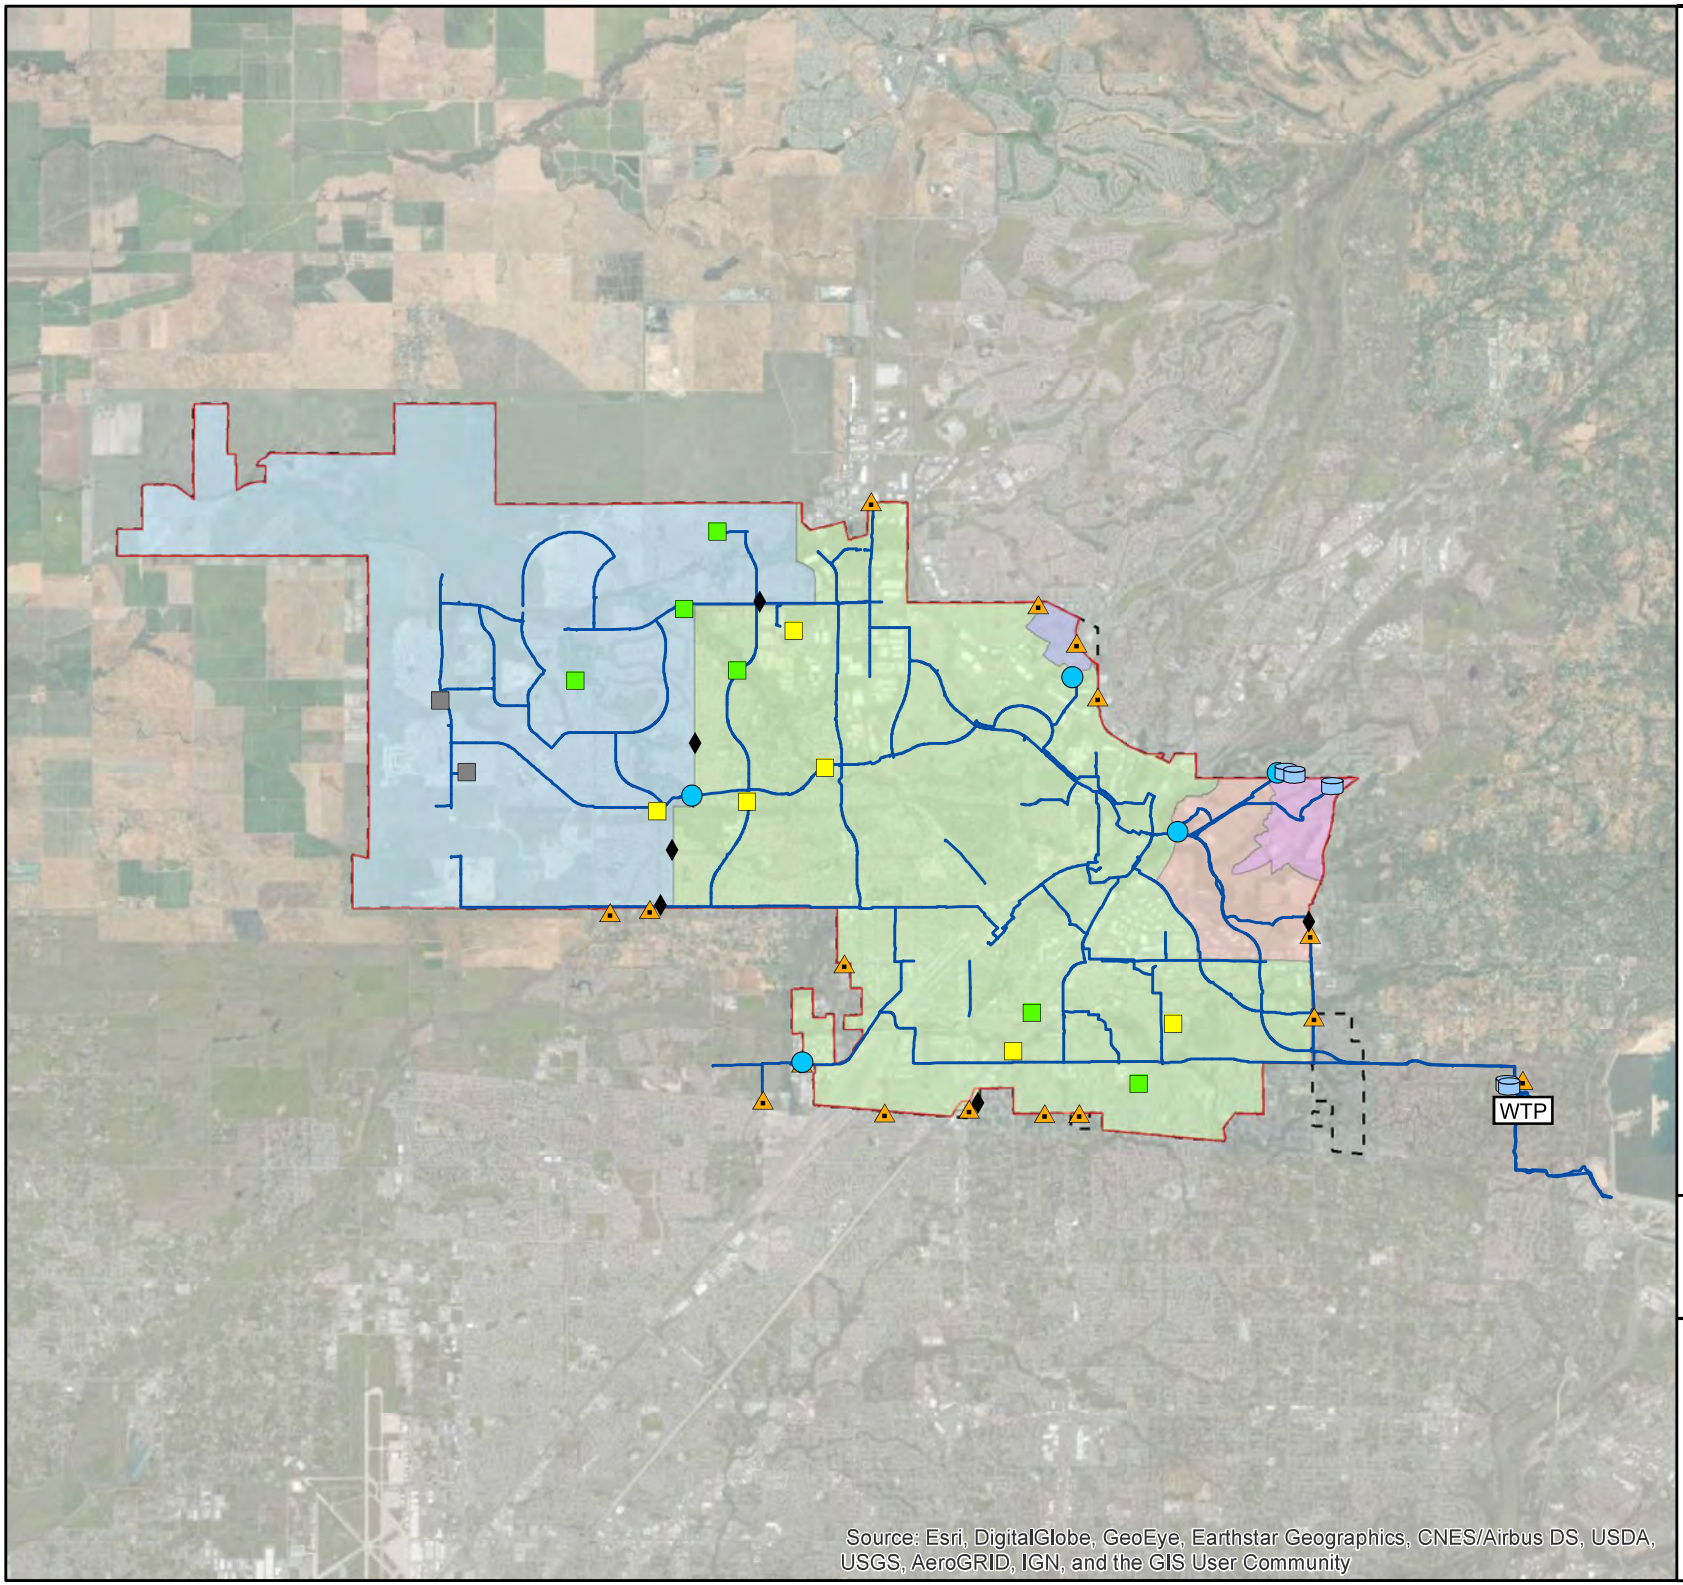

Figure 3-2 Service Area Map

WATERWORKS ENGINEERS

CITY OF ROSEVILLE CALIFORNIA

3.3 Service Area Climate

The service area experiences cool and humid winters and hot and dry summers. The City of Roseville's climate is similar to the City of Sacramento, which is in close proximity. Historical climate data was obtained from California Irrigation Management Information System (CIMIS) for station 155, which is located in Sacramento, for the reporting period of this UWMP and is summarized in COR Table 3-E. The average monthly temperature from 2016 to 2020 ranged from 39.8 degrees Fahrenheit (°F) to 95.1 °F. Typically the wet season begins in October and ends in May, with an average annual total precipitation of 13.3 inches.

COR Table 3-E Monthly Average Climate Data from 2016 through 2020

Month	Average Minimum Temperature (°F)	Average Maximum Temperature (°F)	Average Temperature (°F)	Average Monthly Precipitation (inches)
January	42.7	56.3	49.5	3.6
February	42.5	61.7	52.1	1.7
March	46.3	64.7	55.5	2.3
April	50.6	73.3	62.0	0.8
May	54.2	80.6	67.4	0.8
June	59.2	90.5	74.9	0.0
July	60.9	95.1	78.0	0.0
August	61.3	92.4	76.9	0.0
September	58.9	87.5	73.2	0.0
October	51.7	78.2	65.0	0.7
November	44.7	65.0	54.9	1.2
December	39.8	56.7	48.3	2.1
Averages	51.1	75.2	63.1	1.1

3.4 Service Area Population and Demographics

This section describes the population, demographic, and employment conditions of the City's water service area during the reporting period of the UWMP as well as future projections through 2045.

3.4.1 Service Area Population

Water use is directly tied to a service area's population and analyzing population growth and development trends is critical for the City's planning of water distribution facilities and infrastructure. Current and projected service area population estimates are provided in DWR Table 3-1. These projections differ from total population as a small number of City residents are served by adjacent water purveyors. The projections were estimated in coordination with the City of Roseville's General Plan, direct input from the City of Roseville's Planning Division, and previous studies performed by the City's Environmental Utilities Division. Methods for estimating population projections are further discussed in 5.2.

DWR Table 3-1

Submittal Table 3-1 Retail: Population - Current and Projected						
Population Served	2020	2025	2030	2035	2040	2045
	140,187	151,742	170,526	193,190	193,190	193,190

3.4.2 Social, Economic, and Demographic Factors

The City of Roseville's population in 2019, according to the American Community Survey (ACS), was reported to be 68.2% White alone (not Hispanic or Latino), 14.5% Hispanic or Latino, 10.1% Asian alone, 2.8% Black alone, and all other race categories were less than 1%. A summary of all race categories surveyed is provided in COR Table 3-F. The United States Census Bureau reports that the median household income from 2015-2019 was $89,082. ACS reports that in 2019 8.4% of the population was in poverty and 16.5% of the population was 65 years of age and over. The social, economic, and demographic factors are not believed to affect water management and planning.

COR Table 3-F City of Roseville 2019 Population by Race

Race Category	Percentage
American Indian and Alaska Native alone, not Hispanic or Latino	0.3%
Asian alone, not Hispanic or Latino	10.1%
Black alone, not Hispanic or Latino	2.8%
Hispanic or Latino	14.5%
Native Hawaiian and other Pacific Islander alone, not Hispanic or Latino	0.1%
White alone, not Hispanic or Latino	68.2%
Some other race alone, not Hispanic or Latino	0.0%
Two or more races alone, not Hispanic or Latino	3.9%

3.5 Land Uses within the Service Area

A new requirement of the California Water Code, since the 2015 UWMP was published, requires that land use projections be coordinated with other local and regional land use authorities.

> *California Water Code 101631.*
>
> *(a) The description shall include the current and projected land uses within the existing or anticipates service area affecting the supplier's water management planning. Urban water suppliers shall coordinate with local or regional land use authorities to determine the most appropriate land use information, including, where appropriate, land use information obtained from local or regional land use authorities, as developed pursuant to Article 5 (commencing with section 65300) of Chapter 3 of Division 1 of Title 7 of the Government Code.*

In August 2020, the City of Roseville completed its update to the General Plan, with a planning horizon that extends into 2035. The General Plan includes the Land Use Element, which is provided in Appendix C. The Land

Use Element discusses existing and future land use conditions, with an intended purpose of setting guidelines for managing land use change. The City of Roseville has both residential and non-residential land uses; density and intensity guidelines for each land use type respectively are set forth in the Land Use Element. The land use categories as well as corresponding characteristics from the Land Use Element are summarized in COR Table 3-G and COR Table 3-H.

COR Table 3-G Residential Land Uses and Development Guidelines

Land Use Category	Dwelling Units Per Acre	Estimated Population Per Gross Acre
Low-Density Residential (LDR)	0.5 – 6.9	1.45 – 20.1
Medium-Density Residential (MDR	7.0 – 12.9	20.3 – 37.41
High-Density Residential (HDR)	≥ 13	≥ 27.3

COR Table 3-H Non-Residential Land Uses and Development Guidelines

Land Use Category	Floor to Area Ratio
Neighborhood Commercial (NC)	20% - 40%
Community Commercial	20% - 40%
Regional Commercial	20% - 40%
Business Commercial	20% - 40%
Light Industrial	20% - 50%
Tech/ Business Park	20% - 50%
General Industrial	20% - 50%
Transfer Station	Varies
Central Business District	≤ 300%
Public/ Quasi-Public	Varies

Chapter 4 Water Use Characterization

This chapter provides a description and quantification of the City's past and current water use and future water use projections through the year 2045. Projections provided herein were coordinated with other local and regional planning documents in an effort to develop reliable water use projections.

4.1 Non-Potable Versus Potable Water Use

The City utilizes both potable and non-potable water to meet the diverse water needs of the customers within the service area. Potable water is water that is safe to drink and meets all California drinking water regulations per Title 22. The City's potable water supplies consist of surface water treated at the WTP, groundwater from various wells throughout the City that is chemically treated on site, finished water wheeled from other agencies through interties, and raw water received from other agencies through interties which is subsequently treated at the WTP.

Additionally, the City supplies recycled water, which is non-potable water for approved uses. Recycled water is wastewater that is treated to Title 22 disinfected tertiary standards. The City operates two wastewater treatment plants (WWTPs), Dry Creek and Pleasant Grove, both of which treat wastewater to the high standard required of recycled water. The recycled water produced at the WWTPs is distributed in a separate system from the potable water system and is utilized for landscape irrigation, environmental releases, cooling water, and construction uses.

Lastly, the City delivers raw water, which is also non-potable, to Linda Creek outside of the City's service area. Raw water is untreated water that is used in its natural state or with minimal treatment. The City is required to discharge 404 AF to Linda Creek as part of its instream flow commitment. The City does not deliver raw water to any of its customers within the service area.

4.2 Past, Current, and Projected Water Use by Sector

The following sections describe and quantify past, current, and projected water use. Water uses are delineated by various sectors. Additionally, the new requirement of the 2020 UWMP requiring quantification of system water losses for the five years preceding this plan are reported as follows.

4.2.1 Water Use Sectors Listed in Water Code

Water Code Section 10631(d) requires that water uses be identified for at least the ten following sectors; definitions for each of the sectors are adapted from those provided in the Guidebook.

- **Single-family residential** – A single family dwelling unit. A lot with a free-standing building containing one dwelling unit that may include a detached secondary dwelling. This is a retail demand.
- **Multifamily** – Multiple dwelling units contained within one building or several buildings within one complex. This is a retail demand.
- **Commercial** – A water user that provides or distributes a product or service. Water Code 10608.12(d). This is a retail demand.
- **Industrial** – Water user that is primarily a manufacturer or processor of materials as defined by the North American Industry Classification System (NAICS) code sectors 31 to 33, inclusive, of an entity that is a water user primarily engaged in research and development. Water Code Section 10608.12(h). This is a retail demand.

- **Institutional and governmental** – A water user dedicated to public service. This type of user includes, among other users, higher-education institutions, schools, courts, churches, hospitals, government facilities, and nonprofit research institutions per Water Code Section 10608.12(i). This is a retail demand.
- **Landscape** – Water connections supplying water solely for landscape irrigation. Such landscapes may be associated with multi-family, commercial, industrial, or institutional/governmental sites, but are considered a separate water use sector if the connection is solely for landscape irrigation. This is a retail demand.
- **Sales to other agencies** – These are water sales made to another agency. Projected sales may be based on projected demand provided by the receiving water supplier. This is a wholesale demand.
- **Saline Water Intrusion barriers, groundwater recharge, or conjunctive use, or any combination thereof** – *Conjunctive use* is a water management strategy where surface water and groundwater are managed together to increase the total water supply. For purposes of the UWMP, conjunctive use is seen as a management strategy rather than as a water use. This type of water use is best reported as groundwater recharge. *Groundwater recharge* can occur through both natural and artificial means. In the context of this UWMP, artificial groundwater recharge is the managed and intentional replenishment of natural groundwater supplies using techniques such as infiltration basins or injection wells. Water used for groundwater banking or storage may also be reported using this sector. If all, or a portion of, the groundwater recharge is subsequently pumped out of the basin in the same year, that water is reported as a supply from groundwater. *Saline water intrusion barrier* is the practice of injecting water into a freshwater aquifer to prevent the intrusion of saltwater. These may be either a wholesale or retail demand. The City currently does not have any demands under this water use sector.
- **Agricultural** – Water used for commercial agricultural irrigation. Water used for processing agricultural products (e.g., food, beverage, or textile manufacturing) may also be considered industrial process water. This may be either a wholesale or retail demand. The City currently does not have any demands under this water use sector.
- **Distribution system water losses** – Losses that were reported in accordance with the 12-month water loss for each of the prior five years.

4.2.2 Water Use Sectors in Addition to Those Listed in Water Code

Presently, the City has no additional water use sectors outside of the ten listed in CWC. Furthermore, the City expects that future water use will be restricted to the same sectors by which water is currently used based on land use projections from the Land Use Element.

4.2.3 Past Water Use

Past potable water use by sector was analyzed to estimate water use projections into the next 25 years, as required by the CWC. By examining past water use, trends can be understood such as, effects of temporary use restrictions during drought years, effects of long-term demand management measures, and the changing profile of service connections by water use sector. Past water uses from the last two UWMP years, 2010 and 2015, as well as the five years preceding this plan are summarized in COR Table 4-A.

COR Table 4-A Past Potable Water Use Volumes by Sector.

Water Use Sector	2010	2015	2016	2017	2018	2019
Commercial	2,042	1,930	2,101	2,218	2,565	3,021
Industrial	891	934	954	921	797	276
Institutional and Governmental	667	561	650	770	384	393
Multi-Family	2,196	1,464	1,556	1,569	1,376	1,358
Single-Family	15,836	11,680	13,215	14,674	15,303	15,387
Landscape	5,534	4,152	4,691	5,491	5,656	5,974
Other (1)	272	–	–	–	–	–
Total	27,438	20,721	23,176	25,643	26,081	26,409
NOTES: (1) In 2015 and subsequent years thereafter, all water demands are characterized by water use sectors defined in the CWC. All Volumes are in AF.						

4.2.4 Current Water Use

The City's potable and non-potable water uses for 2020 by sector are reported in DWR Table 4-1. There are no existing potable or non-potable demands for the use types of saline barriers, conjunctive use, or agricultural.

DWR Table 4-1

Submittal Table 4-1 Retail: Demands for Potable and Non-Potable Water - Actual			
Use Type	2020 Actual		
Water Use Sector	Additional Description	Level of Treatment	Volume
Commercial	Including non-metered	Drinking Water	2,630
Industrial	Including non-metered	Drinking Water	254
Institutional/Governmental	Including non-metered	Drinking Water	412
Multi-Family	Including non-metered	Drinking Water	1,416
Single Family	Including non-metered	Drinking Water	17,115
Landscape	Including non-metered	Drinking Water	6,422
Losses	Including non-metered	Drinking Water	1,600
Sales/Transfers/Exchanges to other Suppliers	Including non-metered	Drinking Water	1,451
Groundwater recharge	Excludes groundwater pumped and supplied to distribution system.	Drinking Water	597
Sales/Transfers/Exchanges to other Suppliers	Discharge to Linda Creek and water wheeled on behalf of SJWD	Raw Water	404
		TOTAL	32,300
NOTES: All volumes are in AF. Losses are for potable water only. The 2020 Water Audit has not been validated at the time of plan preparation and final losses reported in the validated Water Audit may differ.			

4.2.5 Projected Water Use

The City frequently completes studies aimed at understanding future water use demands to determine the reliability of system supplies and identify and plan for any vulnerabilities. As stated in 3.4.1, the service area population directly impacts water use demands. To estimate projected water use through 2045, the following approach and resources were utilized:

Assumptions:

- The Planning Division's population projection from the 2020 General Plan Land Use Element was utilized, which estimates a population of 198,000 at buildout of all planned development.
- Based on coordination with the City of Roseville's Planning Division, assumed that all planned development would be complete by 2035.
- Assumed that the population past 2035 would remain constant at 198,000 through 2045.
- An estimated 1,843 dwelling units in the City of Roseville are not served by the City. The number of dwelling units are estimated based on other utility accounts.

Population Projection and Water Use Projection Steps

1. Calculated the population not served by the City by multiplying the number of dwelling units and California Department of Finance (CDoF) household multiplier.
2. Subtracted the population not served by the City from the total CDoF City of Roseville population to obtain the service area population for 2016 through 2020.
3. Estimated the current percentage of development for each specific plan from aerial imagery.
4. Input current percentage of development into the City of Roseville's Environmental Utilities (EU) Department's Water Demand Tracking Tool, which calculates buildout water usage for each specific plan. Water use in the Tool is calculated by applying unit demand factors, specific to land use categories, to each of the dwelling units Demand factors and total water use for all specific plans are provided in COR Table 4-B and COR Table 4-C, respectively.
5. Plotted the service area population from 2016 through 2020 and the projected population for 2035 to approximate the population for 2025 and 2030 (Figure 4-1). The resultant population projections were previously summarized in DWR Table 3-1.
6. Updated the Water Demand Tracking Tool development percentage for 2025 and 2030 to reflect population projections and for 2035 to reflect 100% at buildout.

COR Table 4-B Unit Demand Factors for Land Use Type

Residential Land Use Categories	Unit Demand Factor (gpd/DU)
Low Density Residential 1 – LDR1 (<3.5 DUs/Acre)	728
Low Density Residential 2 – LDR2 (3.5 to 5 DUs/Acre)	600
Low/Medium Density Residential 1 – LMDR1 (>5 to 6 DUs/Acre)	521
Low/Medium Density Residential 2 – LMDR2 (>6 to 8 DUs/Acre)	430
Medium Density Residential – MDR (>8 to 12 DUs/Acre)	323
High Density Residential – HDR1 (>12 to 16 DUs/Acre)	288
High Density Residential – HDR2 (>16 DUs/Acre)	177
Non-Residential Land Use Categories	**Unit Demand Factor**

	TOTAL	50,572	47,567	52,555	57,614	57,614

NOTES: The city has no contracts for transfer for 2025 through 2045, as of yet. Projections are inclusive of lower income residential water demands. All values are in AF.

Total Gross water use projections, inclusive of recycled water, are provided in DWR Table 4-3. Recycled water demand is further characterized in DWR Table 6-4 of Chapter 6

DWR Table 4-3

Submittal Table 4-3 Retail: Total Gross Water Use (Potable and Non-Potable)						
	2020	2025	2030	2035	2040	2045
Potable Water, Raw Water	32,300	47,567	52,555	57,614	57,614	57,614
Recycled Water Demand	3,768	4,022	4,435	4,933	4,933	4,933
TOTAL WATER USE	36,068	51,589	56,990	62,547	62,547	62,547
NOTES: All values are in AF. Values include potable and non-potable water use.						

4.2.6 Distribution System Water Losses

Distribution system water losses are the difference between the volume of water that is delivered into the potable drinking water distribution system and actual consumption. Losses are always present in a water system due to pipe leaks, unauthorized connections or use, faulty meters, and unmetered institutional and governmental water use. Each year the City characterizes its water loss in accordance with the American Water Works Association (AWWA) Water Audit Method. CWC requires urban retail water suppliers to conduct and submit validated water loss audit reports annually to DWR on October 1st following the reporting year. Final Water Audit and Validation Reports are available for 2016 through 2019 and provided in Appendix D. As the UWMP is required to be submitted prior to the due date of the Water Audit, values for 2020 stated herein are approximate and may be altered in the final submission of the 2020 Water Audit. Distribution system water losses for five years preceding the plan update from 2015-2019 are summarized in COR Table 4-D and estimated water loss for 2020 is given in DWR Table 4-4.

COR Table 4-D 12 Month Water Loss Audit Reporting for 2015-2019.

Reporting Period Start Date (mm/yyyy)	Volume Water Loss (AF)
01/2015	2,127.52
01/2016	2,330.47
01/2017	2,682.94
01/2018	2,140.95
01/2019	1,865.24

DWR Table 4-4

Submittal Table 4-4 Retail: 12 Month Water Loss Audit Reporting	
Reporting Period Start Date	Volume of Water Loss*
01/2020	1,599.23
** Taken from the field "Water Losses" (a combination of apparent losses and real losses) from the AWWA worksheet.*	
NOTES: All Volumes are in AF. The 2020 Water Audit has not been validated at the time of plan preparation and final water losses reported in the validated Water Audit may differ.	

An update to the CWC requires that 2020 UWMPs and all UWMPs submitted thereafter include data showing whether the urban retail water supplier met the distribution loss standards enacted by the California State Water Resources Control Board (SWRCB) pursuant to Section 10608.34. At the time of plan preparation, the SWRCB has not adopted performance loss standards. Proposed water loss performance standards will set a maximum allowable water loss in gallons per connection per day for the City. The proposed baseline water loss is an average of the 2017 through 2019 water loss and is calculated to be 41.0 gallons per connection per day and the proposed performance standard to be met by 2028 is 22.3 gallons per connection per day Appendix E. Water loss in gallons per connection per day for 2017 through 2020 is shown in COR Table 4-E.

COR Table 4-E Loss Reported in AWWA Water Audit for 2017-2019.

AWWA Loss Category	2017	2018	2019	2020 [(1)]
Apparent Loss	8.02	8.01	7.90	9.78
Real Loss	46.89	34.97	28.78	21.19
Water Loss	54.91	42.98	36.68	30.97
NOTES: All values are gallons per connection per day. [(1)] The 2020 Water Audit has not been validated at the time of plan preparation and final water loss reported in the validated Water Audit may differ.				

The data from 2017 through 2020 demonstrate that the City annually reduced water loss measured as gallons per connection per day. The City continues to prioritize and allocate resources to detecting and repairing leaks in the distribution to reduce water loss. Over the last five years the City has increased the accuracy of reported losses through a process of quantifying the City's authorized unmetered use of water for institutional and governmental operations, which had previously gone unquantified and were reported as water loss. These municipal functions include fire suppression, street sweeping, hydraulic utility excavation, and others. In dedicating resources to tracking and understanding these internal uses, consumption of water for these authorized uses has not been reduced or restricted and the services continue, as necessary. The City anticipates that it is on track to meet the performance standard by 2028.

Note that in DWR Table 4-2 the projected water loss in 2030 and thereafter was calculated by multiplying the performance standard by the estimated number of service connections and for 2025 an intermediate water loss

multiplier of 27.09 gallons per connection per day was used. 2025 through 2045 number of service connections were estimated using the same ratio of 2020 total number of service connections to 2020 population.

4.2.7 Estimating Future Water Savings

As noted in DWR Table 4-2 and the following DWR Table 4-5, water use projections do consider future water savings and lower income residential demands.

DWR Table 4-5

Submittal Table 4-5 Retail Only: Inclusion in Water Use Projections	
Are Future Water Savings Included in Projections?	Yes
Sections where citations of the codes, ordinances, utilized in demand projections are found.	4.2.7.1 4.2.7.2 4.2.7.3
Are Lower Income Residential Demands Included in Projections?	Yes

The unit demand factors and resultant demands calculated by the EU department in COR Table 4-B and COR Table 4-C do not account for reduced demand from conservation measures. However, based on previous years' demand data, the City has observed that passive conservation measures have resulted in an approximate 25% reduced demand from what was projected. This 25% demand reduction is reflected in DWR Table 4-2 for the potable water use categories of Commercial, Industrial, Institutional/ Governmental, Multi-Family, Single Family, and Landscape. Conservation measures are described in the subsequent sections.

4.2.7.1 Compliance with Water Efficient Landscape Requirements

New development areas are required to reduce landscape area and calculated water demands as part of the process for land use approval, as required by the California Code of Regulations Title 23, Division 2 Chapter 2.7 Model Water Efficient Landscape Ordinance (MWELO). The City of Roseville's own standards have additional requirements for Water Efficient Landscaping, which can be found in Chapter 14.18 of the Roseville Municipal Code (available via the City's website).

4.2.7.2 Increased Utilization of Recycled Water

The City of Roseville requires recycled water to be used in most land use development areas currently being planned, and for construction water during drought years. Future required use includes landscaping associated with commercial, industrial, multi-family, parks, and transportation corridors. Guidelines for Recycled Water Service are outlined in Roseville Municipal Code Chapter 14.17 (available via City's website).

4.2.7.3 Implementation of Low Water Use Fixtures

Section 16.01.100 (A.) of the Roseville Municipal Code (available via City's website) states that: "The 2019 California Building Standards Code is hereby adopted by the City of Roseville Municipal Code."

Additionally, the mandatory CALGreen building standards code promotes conservation through the use of appliances and fixtures such as high-efficiency toilets, faucet aerators, and on-demand water heaters.

4.2.8 Characteristic Five-Year Water Use

The California Water Code Section 10635(a) requires that in addition to calculating water use projections over the next 20 years, in five-year increments, that suppliers perform a drought risk assessment lasting five consecutive years. The projected unconstrained demand for 2021-2025 is estimated in table COR Table 4-F. Unconstrained demand is demand absent any water supply or usage restrictions but does include the conservation practices for new construction, outlined in the previous section. This projection informs the drought risk assessment, which is detailed in Chapter 7 .

COR Table 4-F Five consecutive year unconstrained demand.

Gross Water Use	2021	2022	2023	2024	2025
Potable Water, Raw, Other Non-Potable	35,353	38,407	41,460	44,513	47,567
Recycle Raw Water Demand	3,819	3,870	3,920	3,971	4,022
NOTES: All volumes are in AF.					

4.3 Water Use for Lower Income Housing

Policy LU5.5, of the Land Use Element, strives to uphold the City of Roseville's Affordable Housing Goal by requiring that a minimum of 10% of all new housing units cost no more than 30% of the total monthly income of very low-, low-income, and moderate-income households. The City of Roseville EU Department annually coordinates with the Planning Division to gather data related to low-income housing metrics. The total number of affordable housing units in 2020 was 3,103, of which 633 were single family residences and 2,470 were multi-family residences. The water demands for low-income housing for 2020 were estimated by multiplying the number of single family and multi-family units by the average unit demand factor for low to medium density residential and high density residential, respectively, then reducing it by 20% to account for conservation efforts. These estimations are summarized in COR Table 4-G.

COR Table 4-G 2020 Affordable Housing Water Use

Unit Demand Factors	
Average Low to Medium Density Residential Factor for Single Family Units	520.4 (gpd/DU)
Average High Density Residential Factor for Multi-Family Units	232.5 (gpd/DU)
2020 Affordable Housing Water Use	
Single Family Residential	295 (AF/yr)
Multi-Family Residential	516 (AF/yr)
Total	645 (AF/yr)

As stated in DWR Table 4-5, the water use projections of DWR Table 4-2 are inclusive of water use for lower income households. The estimated water demand by sector for each specific plan, in COR Table 4-C, included affordable housing water use in the single family and multi-family water use calculations, which was used to derive the water use projections in DWR Table 4-2. The portion of water from those projections to be used by affordable housing units is shown in COR Table 4-H. As 10% of all new housing construction is required to be allocated to affordable housing, 10% of the difference between each of the five-year projections was added to the preceding period to estimate how much water would be used by low-income housing.

COR Table 4-H Affordable Housing Water Use Projections

Housing Type	2025	2030	2035	2040	2045
Multi-Family Residential	329	356	426	426	426
Single-Family Residential	1,061	1,255	1,433	1,433	1,433
Total Affordable Housing Units	1,390	1,612	1,859	1,859	1,859
NOTES: All values are in AF/yr.					

4.4 Climate Change Considerations

All projections included in Chapter 4 are representative of unconstrained demand except for passive conservation efforts described in 4.2.7. However, consideration of effects that climate change may have on demand projections and water supply and reliability is a critical aspect of ensuring that the City is well positioned to meet future demands. The City's primary water source is surface water from Folsom Lake and the City recognizes that the reliability of this source is reduced during dry years or a drought. A comprehensive study aimed at understanding how climate change will impact the American River Basin, from which the City receives its surface water supplies, was performed in 2020 and is included in Section 6.14.2. The effects of climate change on water supplies are considered in future plans for the groundwater program, a drought risk assessment, and a Water Shortage Contingency Plan**,** which are provided herein.

Chapter 5 SBX7-7 Baselines, Targets, and 2020 Compliance

With the adoption of the Water Conservation Act of 2009, also known as Senate Bill X7-7 (SB X7-7), the State of California is required to achieve a 20% reduction in urban per capita water use by December 31, 2020. Additionally, incremental progress towards meeting the goal was required to be demonstrated in the 2015 UWMP. The 2015 UWMP calculated gallons per capita per day (GPCD) water use and confirmed that the 2015 interim target was met, and that progress was being made toward meeting the water use target for 2020. This chapter summarizes baselines and targets, which were quantified in previous UWMPs, and confirms that the City's 2020 water use is compliant with SB X7-7 legislation.

5.1 Baselines and Targets

The City first addressed SB X7-7 in the 2010 UWMP, where baseline per capita water use, the 2015 interim target, and 2020 target were established and adopted. For the 2015 UWMP update the Department of Water Resources issued guidance that there were significant discrepancies between the CDoF estimated 2010 population and the 2010 population as determined by the 2010 U.S Census, which could result in poor baseline population estimates. Consequently, the City and other water suppliers were required to recalculate baseline population that had been reported in the 2010 UWMP and to modify the 2015 and 2020 targets accordingly.

SB X7-7 requires each urban water retailer to determine their baseline daily per capita water use measured in GPCD, over a 10-year or 15-year baseline period. The 10-year baseline period is defined as a continuous 10-year period ending no earlier than December 31, 2004 and no later than December 31, 2010. SB X7-7 also defines that for suppliers which met a minimum of 10% of their 2008 water demand through recycled water that the baseline could be extended to a maximum of a 15-year baseline period. Only 8.76% of the City's demand was met with recycled water in 2008, consequently the City used a 10 consecutive year period for its baseline. Additionally, SB X7-7 requires that a 5-year baseline per capita water demand be calculated over a 5 consecutive year period ending no earlier than December 31, 2007 and no later than December 31, 2010. Given the requirements the City used the following baseline periods:

- 10-year Baseline Period: 1995-2004
- 5-year Baseline Period: 2003-2007

Since the 2015 UWMP was completed, the City has experienced no changes to the service area that would require recalculation of baseline or targets; there have been annexations for new construction, but these do not trigger recalculation requirements. Baselines and targets are summarized in DWR Table 5-1. The 2015 SB X7-7 Verification Form, which provides tables for detailed calculations of baselines and targets, is provided in Appendix F.

DWR Table 5-1

Submittal Table 5-1 Baselines and Targets Summary from SB X7-7 Verification Form				
Baseline Period	Start Year	End Year	Average Baseline GPCD	Confirmed 2020 Target
10-15 year	1995	2004	309	247
5 Year	2003	2007	295	

5.2 Service Area Population

To correctly calculate compliance water use in GPCD, the population served by the City must be calculated. The method for 2020 service area population was briefly described in Section 4.2.5 and is further explained herein. The 2020 U.S. Census data were not available at the time of plan preparation and could not be used for population estimates, as such the City of Roseville population for 2020 was obtained from CDoF.

The CDoF population estimate for cities utilizes ACS data to distribute the 2010 U.S. census housing units into CDoF's standard housing types. Number of housing unit estimates are respective of new construction, annexations, demolition, and conversions. CDoF coordinates with both local jurisdictions and the U.S. Census Bureau to obtain housing unit change data. For 2020, CDoF estimated that the total population for the City of Roseville was 145,163. However, there are a few areas in the City of Roseville that are not served by the City. The population of the area not served was estimated by determining the total number of households in those areas and applying the household multiplier. The number of households was approximated based on utility information from other City of Roseville departments and the household multiplier was obtained from CDoF. The resulting population for the areas not served by the City is 4,976 and this was subtracted from the CDoF total population to obtain a 2020 service area population of 140,187.

5.3 Gross Water Use

Annual gross water use is defined by the CWC as the volume of water, treated or untreated, that enters the distribution system except for the following: recycled water, the net volume of water placed into long term storage, water conveyed by the retailer for use by another supplier, water delivered for agricultural use, and process water for industrial use if industrial water use is a significant percentage of overall water use. The volume of recycled water used within the City's service area is reported separate from potable water and is excluded from all gross water use volumes reported herein. No other exclusions or deductions were used in the calculation of the baseline gross water use and so are not included in the calculation of the 2020 gross water use.

5.4 2020 Compliance Daily Per-Capita Water Use

The 2020 compliance daily per capita water use (in GPCD) was calculated in accordance with Methodology 4 of DWR's *Methodologies for Calculating Baseline and Compliance Urban Per Capita Water Use* document. The SB X7-7 Compliance Form is a set of tables containing calculations demonstrating that the City met the 2020 target and achieved a 20% reduction from its baseline and is provided in Appendix G. 2020 GPCD and target compliance are also summarized in DWR Table 5-2.

DWR Table 5-2

Submittal Table 5-2: 2020 Compliance from SB X7-7 2020 Compliance Form				
2020 GPCD			2020 Confirmed Target GPCD	Did Supplier Achieve Targeted Reduction for 2020? Y/N
Actual 2020 GPCD	2020 TOTAL Adjustments	Adjusted 2020 GPCD		
203	0	203	247	Yes
NOTES: No allowable adjustments were applicable to the City.				

CWC Section 10608.24(d)(1) allows for adjustments to be made for factors outside of the supplier's control when determining compliance. Such factors include differences in evapotranspiration and rainfall, substantial changes to commercial or industrial water use due to increased business output and economic development, and substantial changes to institutional water use resulting from extraordinary events. No adjustments were made to the City's 2020 GPCD, as noted in DWR Table 5-2, and the City was able to demonstrate compliance without adjustments.

5.5 Regional Alliance

The City has complied with SB X7-7 and UWMP requirements as an individual supplier and has elected to not participate in a Regional Alliance.

Chapter 6 Water Supply Characterization

This chapter catalogues and describes the various water resources and supplies available to the City of Roseville including contract supplies from other agencies, surface water, groundwater, storm water, wastewater, and recycled water, as well as water transfers. The supply source, origin, quality, quantity, and impacts of climate change on availability for each source are discussed within this section.

6.1 Surface Water

The City's primary water supply contracts are and have historically been comprised of high-quality surface water received through Folsom Reservoir according to the terms of the City's water supply contracts with the US Bureau of Reclamation (USBR), Placer County Water Agency (PCWA), and San Juan Water District (SJWD). Since these supplies are not considered self-supplied and are instead purchased through other agencies, they are described in Section 6.2 Purchased and Imported Water.

6.2 Purchased and Imported Water

The City has historically relied heavily on its water supply contracts with Placer County Water Agency, the US Bureau of Reclamation, and San Juan Water District. All four untreated surface water contract entitlements for American River water total 66,000 acre-feet per year (AF/yr). The City's current contract and supplies of are outlined in COR Table 6-A.

COR Table 6-A Surface Water Supply Summary

Contract Supply	Supply Type	Quantity	Availability
USBR	Raw Surface Water	32,000 AF	Subject to CVP M&I Usage Policy(1)
PCWA	Raw Surface Water	30,000 AF	All Year Types
SJWD	Raw Surface Water	800 AF	Normal or Wet Hydrologic Years
SJWD	Raw Surface Water	3,200 AF	Normal or Wet Hydrologic Years
(1) The City's USBR Supply is subject in any year to determinations of allotments based on unimpaired inflow to Folsom Reservoir and downstream operations.			

Water supplies from all three source agencies outlined above are received through the same point location at Folsom Dam. Folsom Lake has been the primary source of water supply for the City of Roseville since 1971. Surface water from the American River is collected and diverted at the Folsom Lake Pumping Plant located at Folsom Dam. The City receives supplies from all four of its raw water contract entitlements through the Folsom Lake Municipal and Industrial (M&I) Intake at this facility.

Untreated water supplies received at this point are conveyed by gravity or pumped by USBR depending on lake level through two parallel pipelines (84-inch and 72-inch) to the City's Barton Road Water Treatment Plant (BRWTP), with a capacity for treatment of volumes up to 100 MGD. The 72-inch pipeline was constructed in 2010 to increase redundancy and reliability of this critical supply route, in partnership with SJWD. Additionally, the City has 19 intertie facilities with neighboring agencies through which water supplies may be transferred under normal

water year conditions as well as emergency or drought conditions. In the future, the City is exploring options with PCWA to facilitate receipt of treated water directly through existing and/or new intertie facilities.

6.2.1 Contract Supplies – Vulnerabilities and Restrictions

The City's contract supply with the USBR as part of the Central Valley Project is subject to yearly assignments based on each year's hydrologic conditions. Each year the City is informed in April of the determined percentage allotment of the full 32,000 AF allowed by the contract terms. This determination is made based on the unimpaired inflow of runoff into Folsom Reservoir. This supply is therefore highly vulnerable to climate change and its impacts on rainfall and snowpack conditions upstream of Folsom Reservoir in the Sierra Nevada Mountains. In recent years, this allotment has varied significantly on an annual basis and the City has undertaken dedicated efforts to examine alternatives for increasing water supply reliability in all year types.

The City's contract supply with PCWA is available in all hydrologic year types; it is also conveyed from the Middle Fork Project (MFP) through Folsom Reservoir and received as raw water at the same diversion point at Folsom Dam. The City is currently exploring potential future purchase of additional treated water supply received directly from PCWA to complement the raw water contract supply. PCWA's future Ophir Water Treatment Plant may provide up to 3,360 AF to the City in the future. The City is also currently engaged with PCWA to explore improvements to existing intertie facilities to expand and diversify opportunities for the transfer of supplies not dependent on the diversion facility at Folsom Dam.

The City has two water supply contracts with SJWD totaling 4,000 acre-feet. This supply is only available in Normal or Wet Year types and is received either through Folsom Reservoir or through interties with SJWD.

The City's surface water supplies are all dependent upon the operation of Folsom Reservoir by the US Bureau of Reclamation; the dam that creates the reservoir was originally constructed with a primary purpose of flood control, not water supply, and is still operated according to that primary function. The importance of this facility has led the City to examine options for redundancy, resilience, and or improvements with respect to the intake, and best practices in terms of management of its other water resources.

6.2.2 Water Forum Agreement

The City is a member of the Sacramento River Forum and a signatory to the Water Forum Agreement (WFA). Accordingly, the City has agreed to limit its diversions from the upper American River to 58,900 AF/yr during Normal and Wet water years, and to between 58,900 AF/yr and 43,800 AF/yr in Drier and Driest water years. The City is responsibly committed to the Water Forum Agreement but maintains the position that "By instituting programs to conserve water, it abandons no right, title or interest in or to any City water rights, contractual entitlements or any appurtenant rights necessary to exercise such water rights or entitlements," as described by Resolution No. 09-64, Declaring an Intent to Retain Control of Conserved Water (Appendix H).

6.2.3 Other Available Water Purchases

The City may choose to purchase Article 3F water from the Bureau of Reclamation when such supply is available. This supply source is typically only available in winter and spring months as it is generally considered "excess flow" released by the USBR above and beyond the entitlements of downstream users. In 2019 the City exercised this option and used approximately 950 AF of Article 3F water as part of their ASR program to inject and recharge the

aquifer. This effort represented a continued commitment to provide not only water supply reliability for the City's residents but also to support Conjunctive Use to aid in regional water supply reliability.

6.3 Groundwater

In recent years, the City has taken significant steps to expand and strengthen their Groundwater Program to broaden the City's water supply portfolio. The City currently owns and maintains 6 operational groundwater wells, with 6 additional wells planned for development in the next 10 years, and one planned destruction. Four of the 6 operational wells are capable of Aquifer Storage and Recovery (ASR) whereby treated water is injected into the underlying aquifer for later extraction and use. Currently, the City plans to design all new wells with ASR capability, as the City moves toward a more evenly distributed reliance on diverse water resources and regional sustainability.

Groundwater is considered to be available for use as part of Roseville's water supply portfolio in all year types including Normal, Single-Dry, or Five Consecutive Year Drought scenarios. Importantly, groundwater will be a critical resource in future drought years as it supplements increasingly vulnerable surface water supplies.

6.3.1 Groundwater Basin Description

The City is located over the North American Subbasin of the Sacramento Valley Groundwater Basin. The North American Subbasin (DWR Groundwater Basin Number 5-21.64) is located in the eastern central portion of the Sacramento Groundwater Basin, encompassing portions of Sutter, Placer, and Sacramento Counties. As of 2020, the Basin is listed by DWR as high priority in large part due to the population in the basin and existing and projected future groundwater use, but the basin has neither been adjudicated nor is it considered in overdraft or critical overdraft conditions.

Groundwater elevations in the subbasin along the Placer/Sacramento County line declined at a rate of 1 to 1.5 feet per year for multiple decades until approximately the mid-1990s. Some of the largest decreases have occurred in the area of the former McClellan Air Force Base. From 1995, groundwater elevations were stabilized, and the declining elevation trend was dampened due to groundwater management activities stemming from the Water Forum Agreement restraining further increases in groundwater pumping and implementation of in-lieu banking in the region. Groundwater elevations in Sutter and northern Placer counties generally remain stable, although some wells in southern Sutter County have experienced declines.

In addition, the subbasin has historically been pumped by agricultural and urban users. Recently, in some areas of the subbasin, agricultural land has been and is being developed and converted to urban uses. At this time, the subbasin is operating within the current estimate of sustainable yield.

6.3.2 Groundwater Management

The City actively manages groundwater resources both internally in coordination with land use planning and growth projections as well as regionally in accordance with the provisions of the Sustainable Groundwater Management Act. These efforts are discussed in the following subsections.

6.3.2.1 Western Placer County Groundwater Management Plan

A Groundwater Management Plan (GMP) was completed in November of 2007 in accordance with Senate Bill (SB) 1938 and Assembly Bill (AB) 3030 in cooperation with PCWA, City of Lincoln, and California American Water. The GMP is available through the PCWA website: Western Placer Groundwater Management Plan.

6.3.2.2 Sustainable Groundwater Management Act (SGMA)

The Sustainable Groundwater Management Act of 2014, or SGMA, was a three-bill legislative package composed of AB 1739 (Dickinson), SB 1168 (Pavley), and SB 1319 (Pavley). The package was passed in September 2014 and contains a framework for sustainable management of groundwater supplies by local agencies, with a limited role for state intervention if local agencies fail to meet the requirements of SGMA. SGMA lays out a process and a timeline for local authorities to achieve sustainable management of high and medium priority groundwater basins throughout the state. It also provides tools, authorities, and deadlines to achieve statewide sustainable groundwater management. For local agencies involved in implementation, the requirements are significant and will take years to accomplish. DWR has the responsibility to evaluate local agency progress, while the SWRCB may intervene if DWR determines that local agencies fail to make progress and achieve the requirements of SGMA. Essentially, local agencies who volunteer to comply with SGMA must form as Groundwater Sustainability Agencies (GSAs) and prepare, adopt, and implement a Groundwater Strategic Plan (GSP) that meets the requirements of SGMA.

More specifically, critical required steps include the formation of GSAs within two years of when SGMA became effective; the adoption of GSPs within 5-7 years depending on the status of the basin in question (in critical overdraft condition or not); and preparation, adoption and implementation of a GSP(s) that achieves the sustainability goal within 20 years of plan adoption.

SGMA applies to basins or subbasins designated by DWR as high or medium-priority, based on a statewide prioritization that uses criteria including population, importance and amount of groundwater pumped, extent of irrigated agriculture dependent on groundwater, and other criteria. DWR's final Basin Prioritization findings indicate that there are 127 of California's 515 groundwater basins and subbasins which are high and/or medium-priority. These high and medium-priority basins account for 96% of California's annual groundwater pumping and include 88% of the state's population. The priority ranking for the North American sub-basin of the Sacramento Valley groundwater basin is 24 out of the state's 515 basins, with an overall ranking score of 22.5 and a designation of High Priority.

The City is well along the path of SGMA compliance, having joined the West Placer Groundwater Sustainability Agency (WPGSA) consisting of the City of Lincoln, Placer County Water Agency, Nevada Irrigation District, and the County of Placer. The WPGSA is one of a group of five GSAs formed within the North American Subbasin that consist of West Placer Groundwater Sustainability Authority, Sacramento Groundwater Authority, South Sutter Water District, Sutter County, and Recreation District 1001 GSAs. All five of these GSAs will prepare and submit one joint GSP for the entire Subbasin. This GSP will be submitted to DWR in advance of the January 31, 2022 deadline for high-priority basins not currently in critical overdraft.

6.3.3 Historical Groundwater Production

Until recently, groundwater had not been utilized by the City under normal year conditions. In the 2015 UWMP, the City's groundwater wells were identified for use only in drought or emergency conditions, with minimal pumping for the purpose of maintenance or demonstration of the City's ASR program. Over the last five years, the City has worked to advance and expand the groundwater infrastructure and groundwater program to provide additional water supply reliability.

Beginning in 2018, the City began to regularly operate existing groundwater infrastructure specifically by pumping small volumes of groundwater from the City's production wells and serving that water into the distribution system as part of the maintenance plan. In 2019 and 2020, the City was able to store excess surface water through the use of ASR production wells by injecting that water into the aquifer. As the City continues to develop this program and look to the future of sustainable supply, groundwater pumping patterns will continue to evolve. A summary of the amount of groundwater pumped by the City over the past five years is provided in DWR Table 6-1.

DWR Table 6-1

Submittal Table 6-1 Retail: Groundwater Volume Pumped						
☐	Supplier does not pump groundwater. The supplier will not complete the table below.					
☐	All or part of the groundwater described below is desalinated.					
Groundwater Type	Location or Basin Name	2016	2017	2018	2019	2020
Alluvial Basin	North American Sub-basin of the Sacramento Valley Groundwater Basin 5-21.64	0	0	16.6	23.37	201.1
	TOTAL	0	0	17	23	201
NOTES: Water pumped from Roseville groundwater wells does not need to be desalinated.						

6.3.4 Aquifer Storage and Recovery

The City considers development of a diverse and drought resistant water supply portfolio of primary importance. To this end, the City has invested in both planning and capital improvements develop their Aquifer Storage and Recovery (ASR) Program into a highly functional and critical component of the Water Utility's future. The ASR Program utilizes groundwater pumping infrastructure along with existing water supplies to increase reliability. ASR wells are capable of injecting treated surface water from the distribution system into the groundwater aquifer for later extraction and use. A schematic of wells equipped for ASR within an urban environment, accessing the underlying aquifer for groundwater, is provided in Figure 6-1.

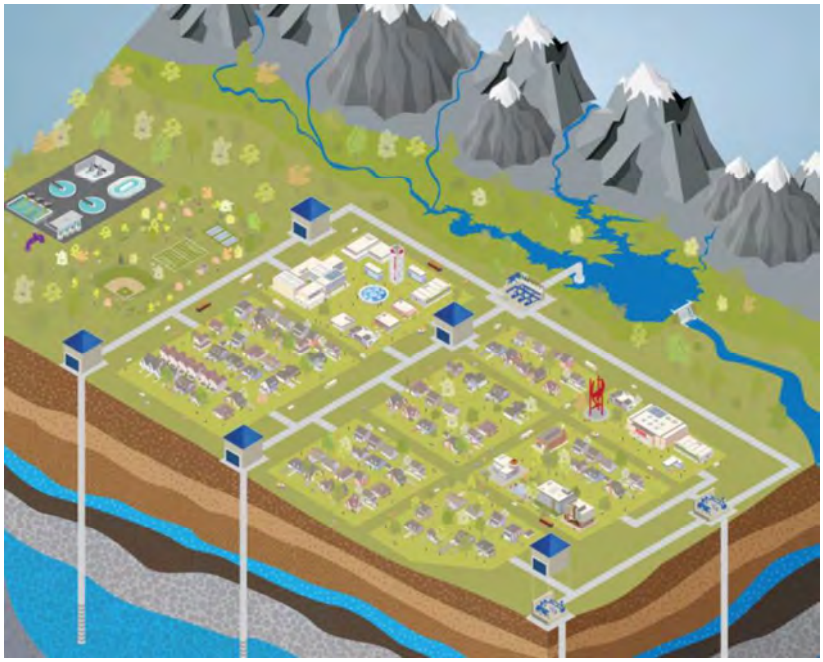

Figure 6-1 Urban Groundwater Infrastructure Schematic

ASR production wells can be used seasonally (i.e. throughout the water year) or periodically over many years to create a "groundwater bank", storing surface water supplies within the aquifer in times of abundance (wet season or years) for use in times of scarcity (dry season or years). An important component of an ASR Program is to maintain consistent and detailed records of groundwater levels within the aquifer and extraction/injection volumes. This information is used to ensure the groundwater basin is managed sustainably providing water supply reliability benefits while avoiding impacts to the groundwater basin. The City is a committed leader in the region with respect to the development of potential future cooperative water banking and responsible regional resource management.

6.4 Stormwater

At this time, the City does not employ any active stormwater recovery measures. In recent years, the City has invested in studies to determine whether stormwater recapture represents a possible resource for future diversity in groundwater recharge projects. Considerations include water rights, timing and quantity of available runoff, property rights, and water quality, among others. Given the complexity of the issues pertaining to stormwater capture or surface spreading, the City continues to conduct analyses to determine the feasibility of this option in the future.

6.5 Wastewater and Recycled Water

The City currently owns and operates two regional wastewater treatment facilities that treat wastewater flows collected from the City, South Placer Municipal Utilities District (SPMUD), and some areas of unincorporated Placer County. This section provides information on wastewater management, as well as its current and potential reuse as a recycled water resource.

6.5.1 Wastewater Collection, Treatment, and Disposal

The South Placer Wastewater Authority (SPWA) was created under a Joint Powers Agreement in October 2000 and is comprised of the City of Roseville, South Placer Municipal Utilities District, and the County of Placer. The SPWA oversees policy for funding regional wastewater infrastructure. The City collaborates with the regional partners on forward planning and best practices for the management of these regional facilities.

The wastewater collection and treatment facilities within the City's service area are maintained and operated by City staff. The wastewater collection facilities outside of the City's service area are maintained by the other SPWA agencies (Placer County and SPMUD). Wastewater outside of the City's service area but within the SPWA Service Area Boundary is conveyed through trunk sewers to the City's wastewater treatment facilities located within the City limits. Metering stations are located at the City's service area boundaries to account for the wastewater entering the City's collection system originating from Placer County and SPMUD collection areas.

The City owns and operates on behalf of the SPWA the Dry Creek Wastewater Treatment Plant (Dry Creek WWTP) and the Pleasant Grove Wastewater Treatment Plant (Pleasant Grove WWTP). Both plants discharge tertiary treated wastewater to surface water. Dry Creek WWTP discharges to Dry Creek while the Pleasant Grove WWTP discharges to Pleasant Grove Creek. The two wastewater treatment plants serve an area that extends beyond the City boundaries.

The Dry Creek WWTP provides tertiary-level wastewater treatment. The treatment consists of screening, grit removal, primary clarification, aeration, nitrification and denitrification, secondary clarification, filtration, and ultraviolet disinfection. Disinfected tertiary-treated wastewater from the Dry Creek WWTP meets Title 22 regulations for full, unrestricted use. The current (2020) average dry weather flow (ADWF) is approximately 8.5 MGD, of which approximately 65%, or 5.5 MGD comes from the City of Roseville.

The plant is currently authorized to discharge up to 18 MGD ADWF into Dry Creek under the Municipal General Order. The Dry Creek WWTP discharge is assigned Municipal General Order enrollee number R5-2017-0085-004 and National Pollutant Discharge Elimination System (NPDES) permit No. CAG585001. Per the State Water Resources Control Board Division of Water Rights, the City is required to maintain an instream flow of four million gallons per day discharge to Dry Creek. Disinfected tertiary treated wastewater from the Dry Creek WWTP meets Title 22 regulations for full, unrestricted use. The Dry Creek WWTP currently (2020) produces 1,063 AF/yr of recycled water. A portion of recycled water from Dry Creek is discharged into a gravity line that supplies a school and Morgan Creek Golf Course, both of which are located in Placer County, outside the City's water service area. The remainder of recycled water from the Dry Creek WWTP is pumped into the recycled water distribution system and used within the City's water service area.

The Pleasant Grove WWTP currently (2020) treats approximately 8.1 MG ADWF with approximately 65% or 5.3 MGD coming from the City of Roseville. The Pleasant Grove WWTP provides disinfected tertiary-level treatment through the process of screening, grit removal, secondary aeration, secondary clarification, filtration, and ultraviolet disinfection. The Pleasant Grove WWTP discharge is assigned Municipal General Order enrollee number R5-2017-0085-005 and National Pollutant Discharge Elimination System Permit No. CAG585001. There are no instream flow requirements for Pleasant Grove Creek.

Disinfected tertiary-treated wastewater from Pleasant Grove WWTP meets Title 22 regulations for full, unrestricted use. The Pleasant Grove WWTP currently (2020) produces 2,434 AF/yr of recycled water that is pumped into the recycled water distribution system and used within the City's service area boundary.

Pleasant Grove WWTP is currently undergoing construction of a major capital improvement project which began in November 2019 and is expected to be complete in 2022. The project includes an increase in treatment capacity from 9.5 MGD up to 12 MGD. Improvements to the treatment process include the addition of primary clarification, waste activated sludge thickening, and anaerobic digestion. This project represents significant improvement to the capacity of the Pleasant Grove WWTP with important components of long-term resilience and improved efficiency of the City's utilities.

The project also includes important improvements which benefit the environmental and create renewable energy resources. Methane from anaerobic digestion will be converted to a renewable compressed natural gas (CNG) to fuel the City's growing solid waste fleet and fuel new microturbines that generate electricity for plant usage. The project includes a receiving facility for energy-dense wastes to enhance methane production.

As previously described, both treatment plants are regional wastewater facilities and as such, wastewater is generated both inside and outside of the City from a combination of residential and non-residential sources. A summary of the volume of wastewater processed at and discharged from each of the City's wastewater treatment plant in 2020 is provided in DWR Table 6-2 and DWR Table 6-3.

DWR Table 6-2

Submittal Table 6-2 Retail: Wastewater Collected Within Service Area in 2020						
100%	Percentage of 2020 service area covered by wastewater collection system					
100%	Percentage of 2020 service area population covered by wastewater collection system					
Wastewater Collection			**Recipient of Collected Wastewater**			
Wastewater Collection Agency	Wastewater Volume Metered or Estimated?	Volume of Wastewater Collected from UWMP Service Area 2020	Agency Receiving Collected Wastewater	Treatment Plant Name	Is WWTP Located Within UWMP Area?	Is WWTP Operation Contracted to a Third Party?
City of Roseville	Metered	5,958	City of Roseville	Pleasant Grove WWTP	Yes	No
City of Roseville	Metered	6,501	City of Roseville	Dry Creek WWTP	Yes	No
Total Wastewater Collected from Service Area in 2020:		12,459				
NOTES: All volumes are in AF. Approximately 65% of the flow received at the Dry Creek WWTP and 65% of the flow received at the Pleasant Grove WWTP originates in the City's water service area.						

DWR Table 6-3

Submittal Table 6-3 Retail: Wastewater Treatment and Discharge Within Service Area in 2020

Wastewater Treatment Plant Name	Discharge Location Name or Identifier	Discharge Location Description	Method of Disposal	Wastewater Generated Outside the Service Area Treated?	Treatment Level	2020 volumes				
						Wastewater Treated	Discharged Treated Wastewater	Recycled Within Service Area	Recycled Outside of Service Area	Instream Flow Permit Requirement
Pleasant Grove WWTP	Pleasant Grove Creek	Creek	River or creek outfall	Yes	Tertiary	9,166	6,491	2,434	0	0
Dry Creek WWTP	Dry Creek	Creek	River or creek outfall	Yes	Tertiary	10,001	7,902	956	378	4,481
					Total	19,167	14,393	3,119	378	4,481

NOTES: All volumes are in AF.
100% of influent flow received at both WWTPs is treated and discharged within the City's service area boundary.

6.6 Recycled Water System

6.6.1 Recycled Water Coordination

The City regards recycled water as a valuable resource that is a key component of the City's overall water supply portfolio. The City operates its recycled water system and program in coordination with its regional wastewater partners, including South Placer Municipal Utilities District and Placer County. The City has been successfully irrigating landscaped areas throughout the City \and planning recycled water implementation as part of new development surrounding the City. The City prepared the 2016 Recycled Water Systems Evaluation to position the City for implementing the next phases of recycled water projects as new users within the City come online, and as the various UGA's plan for and install recycled water infrastructure.

The City operates the recycled water program though the requirements of Master Reclamation Permit Order 97-147 (Permit). The Permit implements the reclamation criteria of the City's Title 22 disinfected tertiary recycled water. Current uses of recycled water within the City include irrigation of landscapes and golf courses, industrial cooling for the Roseville Energy Park, and construction purposes such as dust control and soil compaction. Recycled water is also conveyed outside the City's water service area for golf course and landscape irrigation.

The City has prepared the South Placer Regional Wastewater 2020 Systems Evaluation Report (Appendix I), which delineates the current and projected service area boundary, including Urban Growth Areas expected to be added in the near future as development continues. The report provides baseline and projected characterizations of its regional wastewater and recycled water systems. The Systems Evaluation Report was updated to address recent annexations by the SPWA partner agencies, planning revisions, as well as changes in wastewater characteristics and flows. Recycled water supplies and availability are directly linked to the planning and operation of the wastewater treatment plants and must be managed and planned in coordination. The City and its SPWA partners continue utilizing recycled water supplies is to promote responsible water supply management. Beneficial use of available disinfected tertiary treated Title 22 recycled water allows surface water and groundwater supplies to be applied to potable uses.

All agency elements for a reuse program within the City boundary, including land planning, development, wastewater treatment, and water supply, are a part of the City of Roseville government organization.

6.7 Recycled Water Beneficial Uses

The City's recycled water program predominantly serves landscape irrigation customers. The City currently delivers recycled water to golf courses, parks, schools, and many miles of streetscape for landscape irrigation within the City's potable water service area. The City also provides recycled water to a school and a golf course outside of the City's potable water service area. The City delivers recycled water to the Roseville Energy Park, which is owned and operated by the City of Roseville Electric Utility, for industrial cooling purposes. Landscapes at both regional wastewater treatment plants also use recycled water for irrigation purposes. Recycled water can be used for construction purposes such as dust control and soil compaction.

The current and projected direct beneficial uses of recycled water in the City's water service area are shown in DWR Table 6-4.

DWR Table 6-4

Submittal Table 6-4 Retail: Recycled Water Direct Beneficial Uses Within Service Area										
Name of Supplier Producing (Treating) the Recycled Water:		City of Roseville								
Name of Supplier Operating the Recycled Water Distribution System:		City of Roseville								
Beneficial Use Type	Potential Beneficial Uses of Recycled Water	Amount of Potential Uses of Recycled Water	General Description of 2020 Uses	Level of Treatment	2020	2025	2030	2035	2040	2045
Landscape irrigation (excludes golf courses)	Landscape irrigation of public areas and medians.	3,164	Landscape irrigation of public areas and medians.	Disinfected Tertiary	1,336	1,446	1,625	1,841	1,841	1,841
Golf course irrigation	Irrigation	2,577	Excludes golf course usage outside service area boundary.	Disinfected Tertiary	1,744	1,888	2,121	2,403	2,403	2,403
Industrial use	Industrial cooling	310	Roseville Energy Park (REP) cooling water use.	Disinfected Tertiary	310	310	310	310	310	310
Other	Morgan Creek Golf Course	348	Irrigation	Disinfected Tertiary	378	378	378	378	378	378
				Total:	3,768	4,022	4,435	4,933	4,933	4,933
				2020 Internal Reuse	yes					
NOTES: All values are reported in AF.										

The uses listed in DWR Table 6-4 include use of recycled water supply as well as required discharges. Recycled water uses represent demands within the City's service area boundary including all approved specific plans. The 4 million gallon per day required discharge to Dry Creek as an instream flow requirement totaling 4,480 AF/yr is not shown in DWR Table 6-4.

A comparison of the 2020 actual use of recycled water to what was projected for use in 2020 in the 2015 UWMP is provided in DWR Table 6-5.

DWR Table 6-5

Submittal Table 6-5 Retail: 2015 UWMP Recycled Water Use Projection Compared to 2020 Actual		
Use Type	**2015 Projection for 2020**	**2020 Actual Use**
Landscape irrigation (excludes golf courses)	1,923	1,336
Golf course irrigation	1,378	1,744
Industrial use	1,120	310
Total	4,421	3,390
NOTES: All values are in AF. Golf course irrigation does not include golf course irrigation outside the City's service area (Morgan Creek Golf Course)		

6.8 Actions to Encourage and Optimize Future Recycled Water Use

As of 2020, the peak recycled water production in July is approximately equal to the peak recycled water demand in July. For the City to further expand recycled water usage during the irrigation season, additional recycled water must be made available. This will most likely be accomplished through expansion of operational storage, with the necessary storage volume dependent on actual demand requirements. Therefore, the City will continue to evaluate in-City and regional recycled water demands and consider its ability to provide recycled water for future projects.

It is the policy of the City that where the use of recycled water is feasible, appropriate, and acceptable to all applicable regulatory agencies, the City will require an owner or customer to use recycled water for approved uses. The City has other methods of encouraging recycled water use including a rate discount and public education. The recycled water rate for customers is currently 50 percent of the potable water rate. The City also implements an extensive public education campaign to educate its customers about the reliability and other benefits of recycled water. Another major benefit to customers of using recycled water is that it can be used reliably in times of drought. In the event the City imposes drought restrictions on uses, such as irrigation and construction, recycled water is exempt from these restrictions. Under certain drought stages, the City would mandate the use of recycled water for construction purposes.

One target of future recycled water use is new development, as stated in DWR Table 6-6. A major hindrance to expanding use of recycled water in existing developments is lack of infrastructure. Installing new infrastructure in existing areas is exceedingly expensive. The City requires use of recycled water for all commercial irrigation services in newly developing master planned areas. This is feasible because the recycled water infrastructure can

be installed as part of the original project. Additionally, the City is considering expanding recycled water distribution to entities both within and outside the potable water service area.

DWR Table 6-6

		Total	1,165
NOTES: All values are in AF.			

6.9 Desalinated Water Opportunities

There are no opportunities for the development of desalinated water within the City's service area as a future supply source. The City is not located near any bodies of water that would allow for the option.

6.10 Exchanges or Transfers

The City maintains an on-demand treated water system that is used for municipal and industrial purposes. The City maintains direct treated water interties with five surrounding jurisdictions, as described in Section 2.2.3. The City can transfer water between jurisdictions through these interties or access water to supplement its distribution system. These facilities are designed to be used for wheeling water through the service area or for demand shortage assistance.

As a condition of the Water Forum Agreement, the City has entered into a re-operation agreement with PCWA for up to 20,000 AF to be used when Roseville's surface diversion is cut back. In general, the agreement calls for PCWA to release up to an additional 20,000 AF to the American River on an annual basis during time of reduced water availability in the system. This water is to maintain flows in the Lower American River (Nimbus Dam to Sacramento River), and therefore is not available for the City's use. This re-operation water is considered a transfer, although the ultimate user of the water, if any, has not been identified as part of the agreement - only that the water would be marketed when it was identified as available. It is possible there could be multiple users as the water will flow to the Delta and theoretically be available to all Delta water users.

Also, as a condition of the Water Forum Agreement, the City has committed to not take the entire amount of contracted water from the Upper American River. As a result of having 66,000 AF/yr of water available through various contracts and a commitment to take no more than 58,900 AF/yr from the American River Watershed, there is an opportunity to find a long-term transfer for the 7,100 AF/yr with a user downstream of the confluence of the American and Sacramento Rivers. The Water Code definition of short- and long-term conditions are that short-term is considered for a period of one year or less and long-term is for a period of more than one year.

6.11 Supply Management

The City has historically relied primarily on their suite of surface water contracts, supplying high quality water through the City-owned Barton Road Water Treatment Plant, and serving the City's population through gravity flow. In most year types, the City will continue to rely primarily on these supply sources for the bulk of potable water supply. Of these surface water contracts, the City employs supplies through the USBR contract as a first priority each year, pulling next from the PCWA contract as needed. Each year allocations from the USBR are subject to variation, resulting in potential differences in the duration and quantity of supply pulled from this contract annually.

City Water Utility staff plan to utilize groundwater infrastructure differently in Normal and Dry hydrologic years. In general, Roseville plans to use groundwater infrastructure in accordance with sustainable groundwater management goals and objectives. In a Normal year, this means that the City plans to extract up to the quantity of water banked in that year. In drought years, the City may find the need to operate its wells more significantly to meet demands when significant impacts are seen to surface water supplies. This is outlined further in Chapter 7. As the City continues to install more ASR wells into the coming decade, provisions of the municipal code will be updated to reflect their groundwater strategy.

6.12 Future Water Projects

The City has taken a proactive approach to ensuring resource diversity with a focus on surface water contracts, strong groundwater infrastructure, and highly collaborative regional presence in water planning and future conjunctive use. Future water supply project opportunities, including diversifying the purchasing or importing of water, expansion of the City's groundwater and ASR program, and regional cooperative conjunctive use are discussed in the following sections.

6.12.1 Purchased or Imported Water

In addition to the current contract with PCWA for 30,000 AF/yr of surface water, the City is evaluating and may enter an agreement with PCWA for additional treated surface water supplies available in all hydrologic year types. The treated PCWA water would be supplied by PCWA's future Ophir Water Treatment Plant (Ophir WTP) which will treat water from the Middle Fork Project. The Ophir WTP will be constructed in phases, with the first phase expected to be operational by 2035 and provide an estimated 10 MGD total supply to all customers. Additional phases will be evaluated as PCWA wholesale customers need new supply. The City may purchase up to 3 MGD of normal year capacity from the Ophir WTP, equivalent to 3,360 AF/yr of treated surface water supply.

The City is also exploring future opportunities for water transfers with regional partner agencies in an effort to diversify regional water management strategies in conjunction with responsible groundwater management practices. In 2019, the City executed an agreement for pilot water transfer program with Sacramento Municipal Utilities District (SMUD). This agreement allowed for an annual water transfer for up to 6,000 AF for three years. The transfer allows Roseville to use wet season higher flows to recharge the groundwater aquifer for later season extraction and use. The transfer was executed consistent with Water Forum Agreement policies and goals, as well as an excellent precedent for regional conjunctive use strategies. The City may look to renew this transfer or evaluate similar opportunities in coming years to provide drought resiliency and support the sustainable management of groundwater.

6.12.2 Groundwater and ASR Program

The City has historically relied upon groundwater resources only as a backup supply in times of shortage. Over the last few years and in response to lessons learned during the 2015 drought, changing climate conditions, and the overall need for further diversity and reliability of water supply, the City has invested in efforts to operationalize and expand its groundwater program as a regular part of its water supply portfolio in all year types. Along this vein, the City developed a Groundwater Strategic Plan in an effort to evaluate current infrastructure, potential new well sites, further understand the condition and accessibility of the aquifer within the City's service area boundary, and how groundwater planning would look moving forward. The result of these planning efforts has been the identification of 6 future well sites throughout the City's Pressure Zones 1 and 4, with a heavier emphasis on infrastructure on in Pressure Zone 1. Conceptual design and siting have been completed for these future well sites, with exploratory drilling. The City plans to install these wells and their topside improvements within the next 5-10 years, all with ASR capability to enhance flexibility of operations and expand the City's conjunctive use capabilities. For planning purposes, each well is assumed to extract a nominal 1,750 GPM, with a final production value to be determined upon production well drilling and development. These 6 future wells are expected to represent a total of 16,936 AF/yr of additional water supplies.

Four of the City's six existing wells have ASR injection capability, and at this time the City plans for future wells to also be ASR capable. The ASR Program will not only allow the City to change the pattern of water withdrawal from Folsom Reservoir from peak demand times in the summer to times when water is more available (i.e. the winter) but could also be used as a replacement for surface water in WFA dry/drier years. The expected future water supply programs are listed in DWR Table 6-7.

DWR Table 6-7

Submittal Table 6-7 Retail: Expected Future Water Supply Projects or Programs						
Name of Future Projects or Programs	Joint Project with other suppliers?		Description	Planned Implementation Year	Planned for Use in Year Type	Expected Increase in Water Supply to Supplier
	Yes/ No	Agency Name (if applicable)				
Regional Conjunctive Use	Yes	Various	Regional water banking and aquifer storage and recovery projects.	2025	All Year Types	Not Yet Determined
Production/ASR Well Program Expansion	No		Development of up to 6 new production wells with ASR capability.	2035	Potentially, All Year Types	14,431
Ophir Water Treatment Plant	Yes	PCWA	Partnership with PCWA in the development of additional treated water capacity for purchase through existing interties.	2035	All Year Types	3,360
PCWA-Roseville Cooperative Water Reliability Project	Yes	PCWA	Partnership with PCWA to optimize and improve existing interties to increase supply transfer volumes and reliability.	2025	All Year Types	Not Yet Determined
NOTES: All values are in AF.						

6.13 Summary of Existing and Planned Sources of Water

The City's current planned sources of water can be summarized as such:

- The City is currently contracted to purchase 66,000 total AF/yr of American River water diverted from Folsom Lake with certain restrictions (see Chapter 7).
- The City intends to purchase an additional treated water supply from PCWA of 3,360 AF/yr as part of their Ophir Water Treatment Plant project.
- The City neither currently uses nor plans to use surface water that is not mentioned above.
- The City maintains groundwater wells for normal, drought year, and emergency supply. Four of the City's 6 existing active production wells possess ASR capability.
- The City does not currently use storm water as a potable water offset. The City is investigating future opportunities to use stormwater in other beneficial ways.
- The City currently utilizes and has future plans to expand recycled water usage.
- The City neither currently uses nor plans to use desalinated water.
- The City maintains direct treated water interties with four surrounding jurisdictions for use in emergency or water transfer situations.

The actual 2020 water supplies for the City are summarized in DWR Table 6-8 and the future projected water supplies for the City are summarized in DWR Table 6-9.

DWR Table 6-8

Submittal Table 6-8 Retail: Water Supplies — Actual			
Water Supply	Additional Detail on Water Supply	2020	
		Actual Volume	Water Quality

NOTES: Under normal year operations, the City intends to manage groundwater use sustainably through the active recharge of surface water through the ASR Program. Values shown above assume a 3-month injection window and an equal volume of extraction. New ASR well infrastructure is expected to be operational by 2030, with additional wells installed by 2035.
All values are in AFY.

6.14 Climate Change Impacts to Supply

6.14.1 Local Climate Change Outlook

The City has acknowledged and incorporated many recent lessons learned from the last 10 years of climate related impacts to the reliability of its water supply. Beginning with the extended drought early in the decade, culminating with the extreme shortages experienced in 2015, Roseville has seen unprecedented curtailments of water supply and how important diversity of sources, diversion locations, and other options become when regular supply is interrupted.

It is expected that regional reductions in Sierra Nevada snowpack will continue and worsen in the coming years, creating uncertainty of surface water supplies – specifically the contract Roseville holds with USBR for 32,000 AF annually which can be curtailed down to 0% depending on each year's hydrologic outcome. Further, in drought years a lack of inflow to Folsom Reservoir can reduce water surface elevations significantly and quickly, with the possibility of exposing the intake facility at the dam.

The City's surface water supplies will be more vulnerable to declining snowpack in coming years, with potential for severe limitations in single dry years as well as periods of persistent drought. Integrating cross-seasonal groundwater management (injecting in times of excess for extraction in times of scarcity) will provide much needed resilience in the face of shifting climate conditions.

With these things in mind, the City has taken steps to operationalize its groundwater infrastructure and work toward beneficial use (injection) of excess wet season supplies in preparation for seasonal shortages in surface supply. It is important to note that Roseville is not simply planning to draw from the aquifer to offset its surface water contracts, but rather that they are making concurrent plans to recharge this aquifer and bank supply before the need arises. It is this type of forward planning that Roseville brings to the regional stage in helping the group of agencies relying on these same supply sources to move toward a more sustainable outlook. Diversity of operations and supply sources allow a more flexible approach to each year's specific hydrologic conditions and water demand.

6.14.2 Regional Climate Studies

In 2020, the American River Basin (Basin) region conducted a climate change study in partnership with local water purveyors and the USBR. The purpose of the American River Basin Study (ARBS or Study) was to develop data, tools, analyses, identify supply-demand imbalances, and climate change adaptation strategies specific to the Basin. Under the "new normal" of a changing climate, the ARBS aims to improve the resolution of regional climate change data and to develop regionally specific mitigation and adaptation strategies. As a participant of the study, and service area contained within the Study Area, the following summarizes climate change findings pertinent for the region. More detail, along with the approved study can be found at www.pcwa.net/planning/arbs.

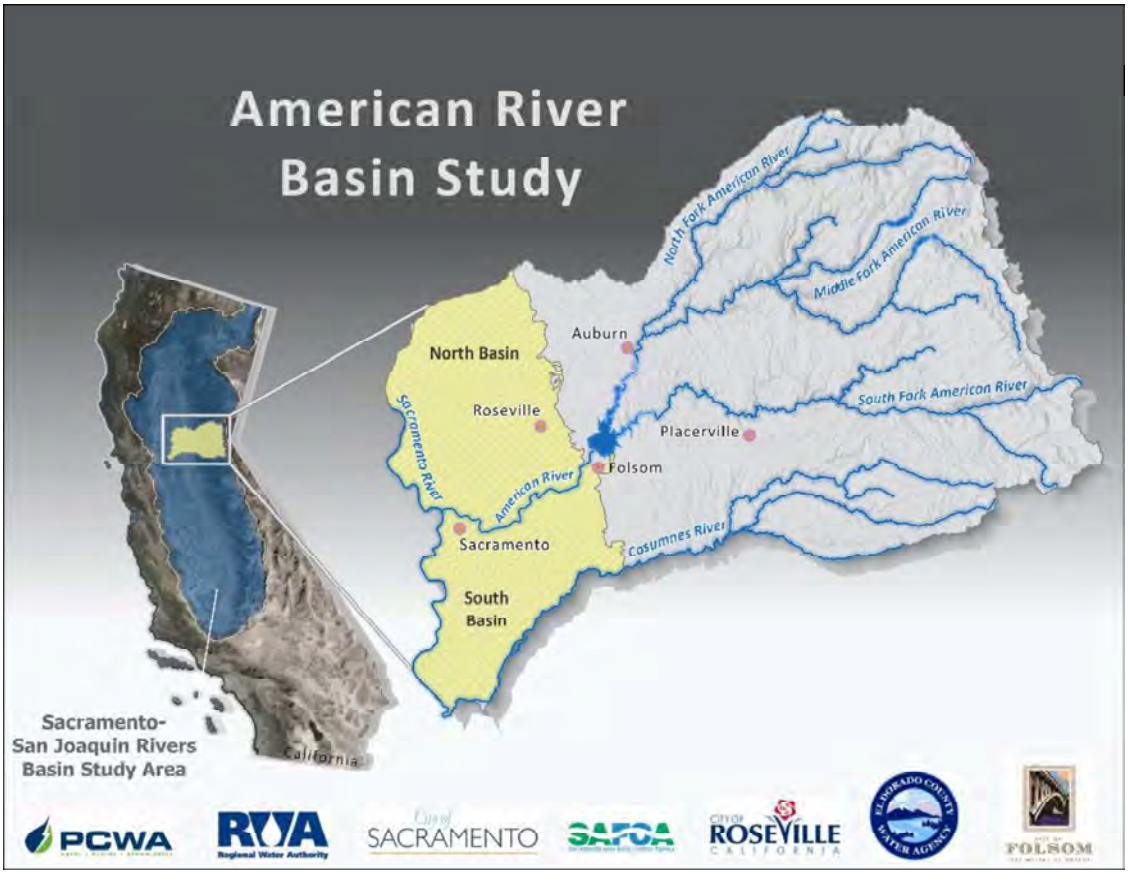

Figure 6-2 American River Basin Study Area

The Study Area is bounded by the Sierra Nevada mountain range to the east, the Feather and Sacramento rivers to the west, the Bear River to the north, and the Cosumnes River to the south (see Figure 6-2). In addition to the American River Watershed, the Study Area encompasses the North and South American Groundwater Subbasins, and Non-Federal Partners' service areas outside of the American River Watershed.

6.14.3 Projected Future Conditions

Analysis of projected future climate conditions in the American River Basin and development of climate scenarios for the ARBS were based on an ensemble of bias-corrected and spatially downscaled climate projections[1]. This ensemble has been used by the California Water Commission and DWR as the primary source of climate projection information in several recent studies, including the Water Storage Investment Program (WSIP) and California's Fourth Climate Change Assessment (Pierce et.al., 2018). Projected future climate conditions were evaluated and characterized based on the ensemble of downscaled climate projections.

[1] Climate projections were developed using Global Climate Models from the Coupled Model Intercomparison Project Phase 5 (CMIP5) and downscaled using Localized Constructed Analogs (LOCA) method projected and coupled with two future emission scenarios (RCP 4.5 and RCP 8.5) available from Dr. David Pierce at the Scripps Institution of Oceanography.

Hydrology scenarios were used to develop streamflow inputs to CalSim 3.0, which was then used to evaluate changes in water supplies, demands, and management throughout the CVP and State Water Project (SWP), including the Study Area. Demands for each water purveyor largely relied upon water purveyor's information provided in Regional Drought Contingency Plan/Regional Water Reliability Plan (RWRP) (Regional Water Authority, 2017) and 2015 UWMPs.

6.14.3.1 Temperature

Surface air temperatures are projected to increase steadily, with average summer temperatures increasing by approximately 7.2 degrees Fahrenheit (°F) by the end of the 21st century (see Figure 6-3), and winter temperatures increasing by 4.9°F. Projections of daily maximum and minimum temperatures suggest similar warming trends during all seasons, with maximum temperatures projected to increase as much as 7.3°F during the summer months.

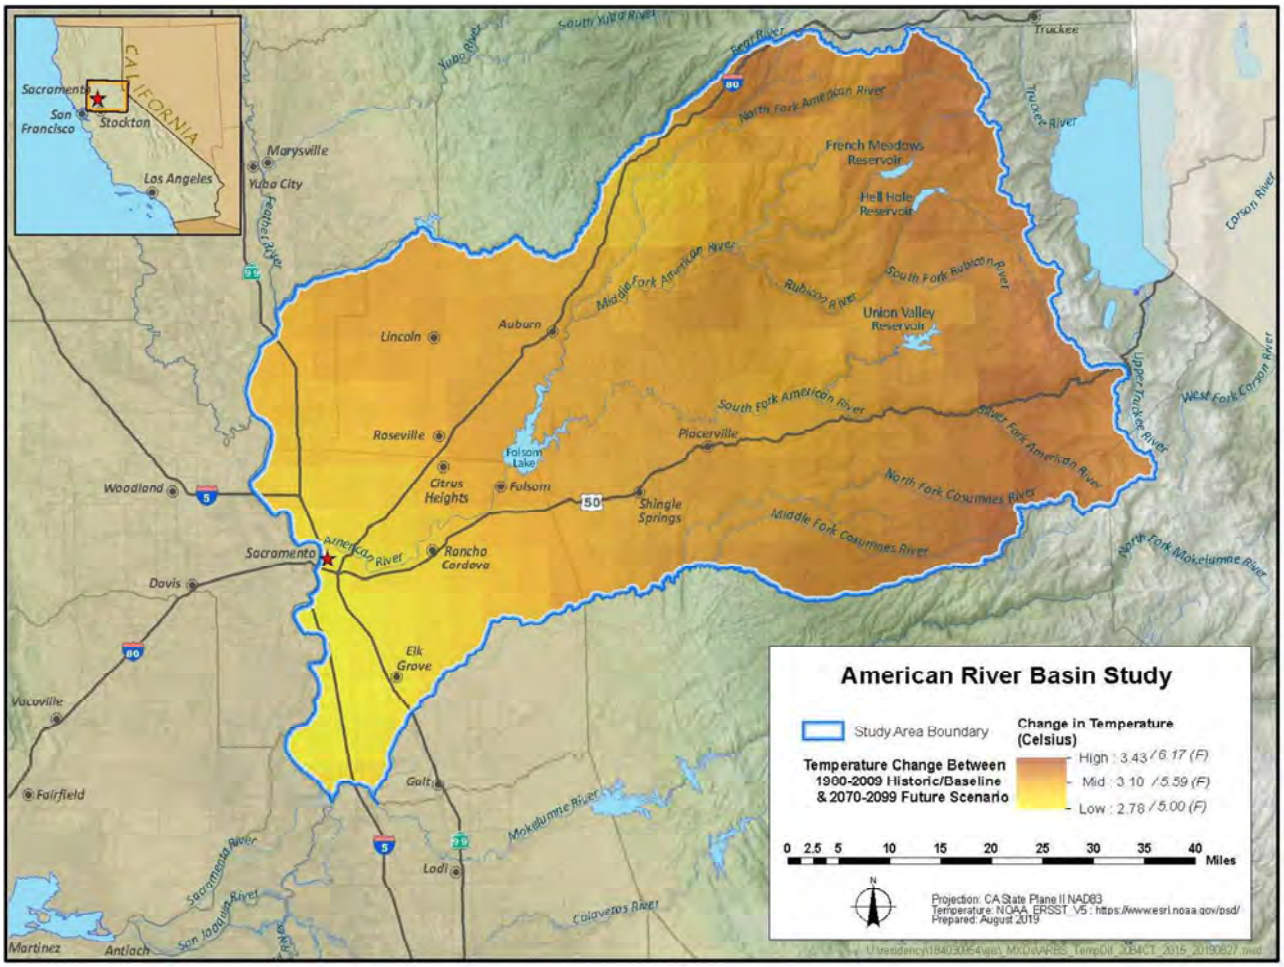

Figure 6-3 Projected Changes in July Temperature between Historical (1980-2009) and End of Century Under Central Tendency Climate Change

6.14.3.2 Precipitation

Annual precipitation projections show no significant trend in the median of change over the 21st century. Many of the available GCM projections show change in precipitation, but there is no consistency in the magnitude and

direction of projected change between models. Approximately half of the projections indicate a minor increase in annual precipitation and half indicate a minor decrease, highlighting the large uncertainty in future precipitation over this region. Although lacking clear trend in projected annual precipitation, by the end of the 21st century the average fall and spring precipitation is expected to decrease, with winter and summer precipitation increasing. Increasing variability is also projected in winter and fall precipitation. A summary of these projections is provided in COR Table 6-B.

COR Table 6-B Projected Change in Precipitation and Temperature Over the American River Basin Study Area Between 1980-2009 and 2070-2099

Season	Percent Change in Basin-Averaged Annual Mean Precipitation (%)	Change in Basin-Averaged Annual Mean Daily Air Temperature (°F)	Change in Annual Mean of Daily Maximum Air Temperature (°F)	Change in Annual Mean of Daily Minimum Air Temperature (°F)
Fall	-6.0	5.8	6.1	5.5
Winter	4.7	4.9	5.0	4.8
Spring	-11.9	5.8	6.3	5.1
Summer	10.4	7.2	7.3	7.0

6.14.3.3 Snowpack

Snow water equivalent (SWE) is a key indicator of water supplies in this region, where runoff is largely influenced by snowmelt. The increasing variability in precipitation combined with increases in surface air temperatures are key drivers in projections of a reduction in annual average SWE. Average SWE is forecasted to decrease by 50-85% across all climate scenarios and future time periods. In addition, areas that accumulate snow above Folsom Reservoir are also projected to have up to a 12-inch decrease in maximum snowpack by end of the century.

6.14.3.4 Evapotranspiration

Potential evapotranspiration (PET) serves as a key indicator of landscape water demands, including consumptive use by evaporation and transpiration from bare soil, water surfaces, native vegetation, and crops. Average annual PET is expected to increase 1.2 to 6.2 inches across all climate scenarios and future time periods. PET is strongly correlated with air temperature and thus expected to increase more under the hot scenarios (HD, HW) than under the warm scenarios (WD, WW).

6.14.3.5 Runoff

Watershed runoff is a direct indicator of local water supply available, as well as to statewide CVP-SWP system. Climate change projections indicate a pronounced shift in the distribution of runoff from May and June to earlier in the season (December to March), implying a transition in precipitation from snow to rainfall and/or earlier snowmelt and increasing the amount of runoff during the winter months. Peak runoff is expected to shift by more than a month earlier by mid to late century (Figure 6-4). Spring runoff will decrease due to reduced winter snowpack. Similar to the precipitation scenarios, there is large uncertainty in projected runoff where the 'wet' scenarios suggest an increase in annual runoff and the 'dry' scenarios suggest a decrease in annual runoff. The projected changes in basin wide runoff range from an increase of 486 thousand acre-feet (TAF) under the warm-wet scenario to a decrease of 203 TAF under the hot-dry scenario by the end of the century.

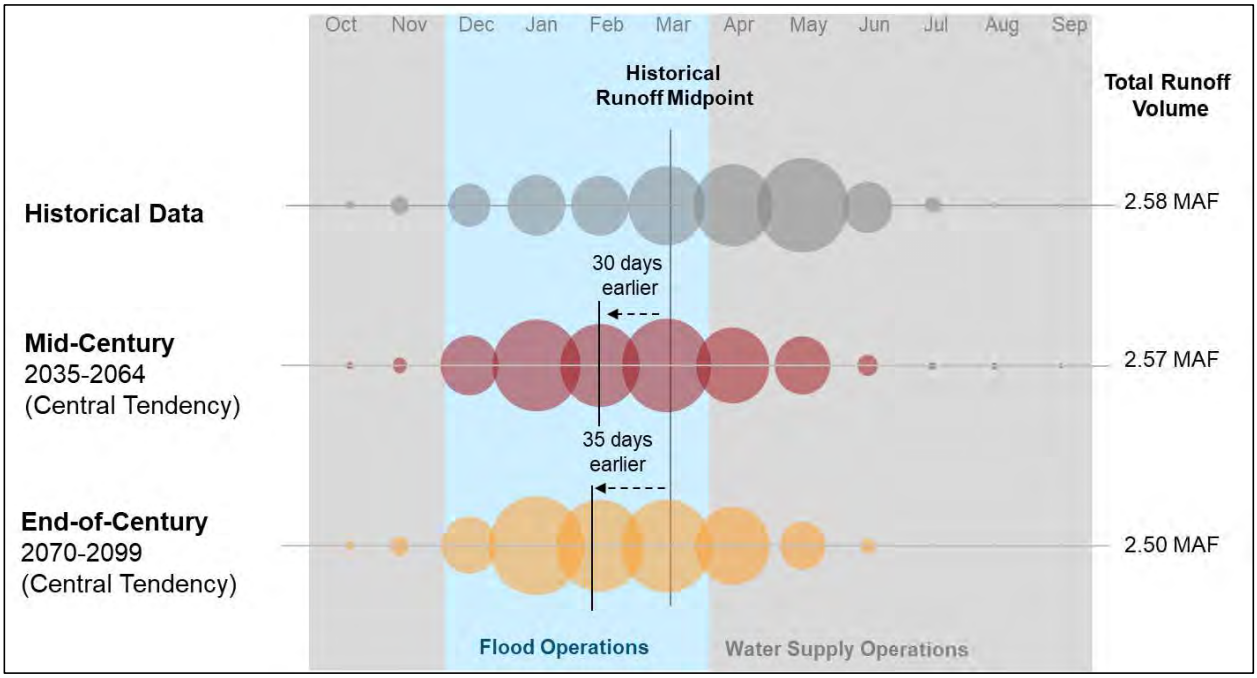

Figure 6-4: Distribution of Average Monthly Runoff for Historical Record (1922-2015) and Future Projections Under Central Tendency Climate Scenario

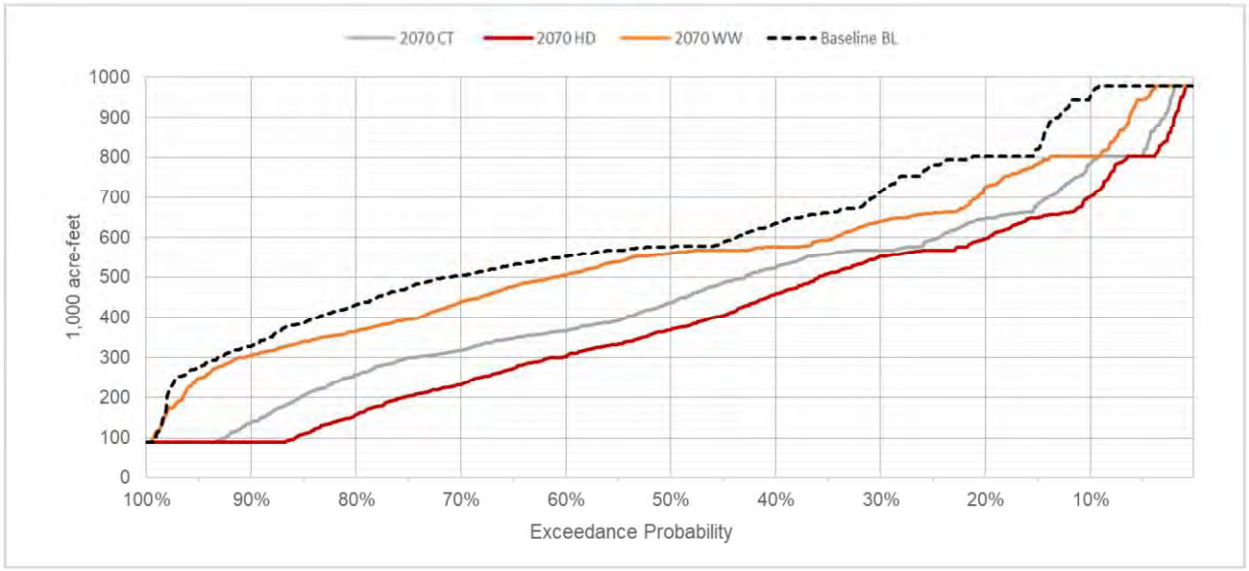
The change in annual climatic and hydrologic indicators between historical baseline observations (1915 to 2015) and projected future conditions for the ARBS area are listed in COR Table 6-C.



COR Table 6-C Change in Hydrologic Indicators Between Historical Observations and Projected Future Hydrology

Time Period	Climate Scenario	Precip (in)	T_{avg} (°F)	T_{max} (°F)	T_{min} (°F)	PET (in)	SWE_{avg} (in)	SWE_{max} (in)	Runoff (TAF)
1915-2015	Historical Observations	38.2	54.8	67.8	35.6	42.8	1.5	5.7	1,458
2040-2069	Warm-Wet	1.9	4	6.2	1.6	1.6	-0.7	-2.3	701
	Central Tendency	0.1	5	8.1	2.1	2.7	-0.9	-2.8	-2
	Hot-Dry	-2.8	6.2	10.4	2.7	3.7	-1.1	-3.4	-206
2055-2084	Warm-Wet	3.8	4.7	7.4	2	2	-0.8	-2.5	199
	Central Tendency	-1.1	6.3	11.1	2.6	4.1	-1.08	-3.5	-93
	Hot-Dry	-3.4	7.9	13.3	3.7	5	-1.2	-3.8	-185
2070-2099	Warm-Wet	7	5.4	8.3	2.5	1.8	-0.9	-2.9	486
	Central Tendency	-0.6	6.5	11	2.8	3.9	-1	-3.3	-54
	Hot-Dry	-4.6	8.9	15.7	4.1	6.2	-1.3	-4.3	-203

Water Supply Reliability

Changing climate conditions in the Sierra Nevada Mountains threaten the volume of water stored in the snowpack and the timing of runoff entering Folsom Reservoir. Consequently, they can also affect the critical role of Folsom Reservoir in the CVP Operations. Reliance on Folsom Reservoir is expected to increase commensurate with the

impact of sea level rise on salinity in the Delta. Modeling of these factors has illustrated that, without operational adjustments, Folsom Reservoir is projected to have lower end of conservation season (end of September) storage levels and approach "dead pool" more often under most future climate scenarios (see Figure 6-4). Similarly, increased early season runoff would increase flood risks along the Lower American River, leaving less water in the upper watershed available during water supply operations.

Key:
Baseline BL = Historic Conditions, 2070 CT = Central Tendency 2070 Climate Scenario, HD = Hot-Dry 2070 Climate Scenario, WW = Warm-Wet 2070 Climate Scenario

Figure 6-5 Exceedance Plot of Folsom Reservoir Storage (end of September) Under Future Climate Change

Under the 2070 level of development, the ARBS projects a supply-demand imbalance of 63 to 78 TAF/year in the Upper Basin (or Foothills Area) without further conservation or management actions. In the Lower Basin, groundwater extraction is expected to increase by 62 to 155 TAF/year to offset the projected imbalance, which would affect groundwater sustainability.

Based on the water supply and demand imbalance results, the region's water supply reliability has vulnerabilities. The ARBS assessed several adaptation portfolios for addressing the range of vulnerabilities and future supply-demand imbalances for the Study Area for regional benefits. Portfolios analyzed were:

1. Foundational Institutions
2. No Assurances for Long-term CVP Water Contract
3. Alder Creek Storage and Conservation Project
4. Sacramento River Diversion Project
5. Federally Recognized Groundwater Bank (North and South Basin)
6. Folsom Dam Raise with Groundwater Banking (South Basin)
7. Modified Flow Management Standard

The seven formulated adaptation portfolios were quantitatively evaluated using CalSim 3 to alleviate supply-demand imbalances and benefits to the region. The Study's intent was not focused on individual water-supplier's portfolio, but rather how the region could plan to increase regional reliability. The precise composition, scale,

operations, partnerships, funding, and governance to advance these project concepts will require further evaluations and coordination among Basin interests, including USBR, DWR, and SWRCB.

While climate change does have an impact on the basin, impacts are largely seen closer to the end of the century, and not within the timeline of the UWMP. Through proactive adaptation management actions, the Study highlights ways for the region to alleviate climate change impacts by the end of century. Therefore, in consideration of the timeline of the UWMP, the City of Roseville does not reflect any climate change impacts in supply and demand scenarios within this Plan.

6.15 Energy Intensity

A new requirement of the CWC, pursuant to 10631.2. (a), for 2020 UWMPs is that suppliers must include information that can be used to calculate energy intensity of their water service. Typically, a large portion of energy consumed in municipalities is dedicated to the conveyance, treatment, distribution, and storage of water. Maintaining water systems involves numerous pumps, motors, and other equipment which run for most or all hours of the day year-round. Because the water operations consume a significant amount of energy, these facilities can be a substantial contributor to greenhouse gas emissions in communities. Understanding how much energy is consumed at the City's various facilities is critical to ensure that the City is mindfully and efficiently utilizing energy resources.

An analysis of the energy intensity, which is the amount of energy consumed per the volume of potable water supplied, is provided in COR Table 6-D.

COR Table 6-D Energy Intensity Reporting

Start Date for Reporting Period	1/1/2020	Sum of Water Management Processes
End Date	12/31/2020	
Volume of Water Entering Process (AF)		32,300
Energy Consumed (kWh)		10,419,600
Energy Intensity (kWh/AF)		322.60
NOTES: Values include only water management processes that are under the City's operational control.		

The City treats and distributes the majority of its potable supply with the significant aid of gravity flow, from Folsom through the WTP and out into the distribution network throughout the City's service area. Data collected to support the analysis included in COR Table 6-D were primarily sourced from energy consumption billing data for the City's conveyance, treatment, distribution, and storage facilities for potable water. Where data was not available, estimates were made based upon similar facilities as well as calculations proportionate to the volume of water involved in the facility process. Some of the City's conveyance or distribution facilities do not have power sources or are owned by the adjacent utility and therefore do not represent consumption included in the calculation above.

Chapter 7 Water Service Reliability and Drought Risk Assessment

This chapter describes the long-term reliability of the City's water supply portfolio in all hydrologic year types through the year 2045. The City's existing and planned water management strategies and options for increasing the reliability of water supplies are also addressed. Shorter term reliability planning that may require immediate action, such as drought or a catastrophic supply interruption, is addressed in the Water Shortage Contingency Plan.

7.1 Constraints on Water Sources

This section addresses potential legal, environmental, water quality, and climatic effects on the reliability of water supply sources through the year 2045.

7.1.1 Legal Constraints

The City does not anticipate legal factors to affect the reliability of recycled water or purchased water supply within the planning horizon of this UWMP.

There are no existing legal constraints that limit groundwater pumping and the groundwater basin is not currently adjudicated. However, as an updated sustainable yield for the subbasin has yet to be defined under SGMA, the legal authority to enforce the sustainable yield of the subbasin has not been created, and the basin is subject to the users' cooperation in managing the basin until a formal authority is created. The City actively participates in regional discussions regarding best practices and cooperative management of water resources. These issues and concerns are being discussed in forums like the Regional Water Authority and as part of the Western Placer County Groundwater Management Plan along with sustainable groundwater management objectives and activities. The collaborative group of City of Roseville, PCWA, City of Lincoln, and California American Water is responsible for and has been identified as the responsible entity for monitoring groundwater levels meeting requirements of the 2009 SB X7-6 California State Groundwater Elevation Monitoring Program (CASGEM) program. Information gathered as part of this program was included in the groundwater model that was developed to support the ASR application with the Regional Water Quality Control Board to determine impacts of proposed extractions and injections related to groundwater levels in the region.

7.1.2 Water Quality Constraints

The City's water supply portfolio consists of high-quality surface water, recycled water, and groundwater resources. In some areas of the City, iron and manganese can be found in native groundwater at concentrations both above and below the secondary taste and odor maximum contaminant level established for these constituents. The City monitors groundwater quality closely, to ensure water provided for potable use does not exceed these standards.

7.1.3 Physical Constraints

The physical constraints of recycled water, surface water, and groundwater are discussed in the following sections.

7.1.3.1 Recycled Water

Recycled water is physically constrained by flows into the City's wastewater treatment plants. It is therefore seasonally available in higher quantities when demands are lowest during the wet season. The distribution

network of "purple pipe" is also a physical constraint for this supply source, as it only exists in the western portion of the City. Access to recycled water and its availability to offset potable needs are therefore, limited by physical access to this pipe network.

7.1.3.2 Surface Water

The City has identified its Folsom Lake intake as a likely physical constraint on current surface water supplies. All three surface water contract supplies are received through this point of diversion, making it a critical facility for the reliability of Roseville's surface water supply. If the water level of Folsom Lake were to drop close to or below the intake elevation as it nearly did in 2015, the City would not be able to divert water without additional infrastructure. The City is also able to receive supply through interties in emergency conditions; however, the WTP represents the primary diversion point. As a result of this vulnerability and lessons learned in the 2015 drought year, the City is actively exploring cooperative efforts with Folsom diversion and operation partners to duplicate or lower the intake facility to alleviate this concern. The City is likewise examining options for alternate diversion points or use of interties to increase reliability of physical water supply access.

The capacities of the Folsom Dam diversion, Roseville Water Treatment Plant, and distribution systems are sufficient to divert, treat, and convey the projected surface water demands. A 150 cubic feet per second (cfs) capacity limitations at the USBR pumping plant, which was agreed to based on recent pumping plant improvements, is sufficient to provide water to meet the City's needs.

7.1.3.3 Groundwater

The physical constraints on the current groundwater supply are the pumping capacities of existing wells. The total pumping capacities from all the six wells are about 11,050 GPM, approximately 15.9 MGD, per Chapter 3 . The City plans to install 6 additional wells by 2035 to provide additional groundwater supplies. Currently, the City plans to design all new wells with ASR capability to allow for greater groundwater banking and extraction capability throughout seasonal variations in surface water supply availability. Many of these planned well sites have been reassessed and relocated to areas of the City's surface are with more advantageous groundwater conditions as well as hydraulics with respect to the distribution network. Installation of wells higher in the hydraulic grade area of the system will allow for a greater downstream sphere of influence for this infrastructure and more flexible system operation in times of reliance on groundwater.

7.1.4 Other Constraints

Aside from legal and physical constraints, several other considerations affect the availability and reliability of Roseville's water supply portfolio. The City's purchased surface water supply is subject to reductions during dry years (seasonal and climatic shortages) pursuant to the Water Forum Agreement (WFA), the USBR Operations Criteria and Plan (OCAP), and the Central Valley Project Municipal and Industrial Water Shortage Policy (CVP M&I WSP). These agreements and programs are discussed in greater detail in the following subsections.

7.1.4.1 Sacramento Water Forum Agreement

The Sacramento Water Forum is a diverse group of business and agricultural leaders, citizen groups, and environmentalists, water managers, and local governments working together to balance two co-equal objectives:

1. **Provide a reliable and safe water supply for the Sacramento region's long-term growth and economic health.**
2. **Preserve the fishery, wildlife, recreational and aesthetic values of the Lower American River.**

The City, along with several other Sacramento-area water suppliers are signatory to the January 2000 Water Forum Agreement which includes Purveyor Specific Agreements, with the most recent revisions affected to these agreements in 2015. The Water Forum Agreement provides the framework for how water resources, including surface water and groundwater supplies would be used in the region, through the year 2030. The City's Purveyor Specific Agreement includes limitations on City surface water diversions from the American River under various hydrologic conditions. The Water Forum categorized water years into three types, all of which are defined in terms of the projected March through November unimpaired flow into Folsom Reservoir. These hydrologic year types are as follows in COR Table 7-A.

COR Table 7-A Water Forum Agreement Hydrologic Year Types

Year Type	Unimpaired Flow into Folsom Reservoir
Normal/Average or Wet Year	Greater than or equal to 950,000 AF
Drier Year	Between 400,000 and 950,000 AF
Driest/Critically Dry Year	Less than 400,000 AF

Although Roseville's water contract entitlements total 66,000 AF/yr, the City's diversions from the American River are limited by the WFA in normal/wet years, drier, and driest years. In normal/wet years, the City has agreed to limit surface water diversions from the American River to 58,900 AF/yr. In driest or critically dry years, the maximum diversion from the American River is limited to 43,800 AF/yr. In drier years, the City may divert an amount between 43,800 and 58,900 AF/yr from the American River, calculated linearly depending on the unimpaired flow into Folsom Reservoir, as shown in Figure 7-1.

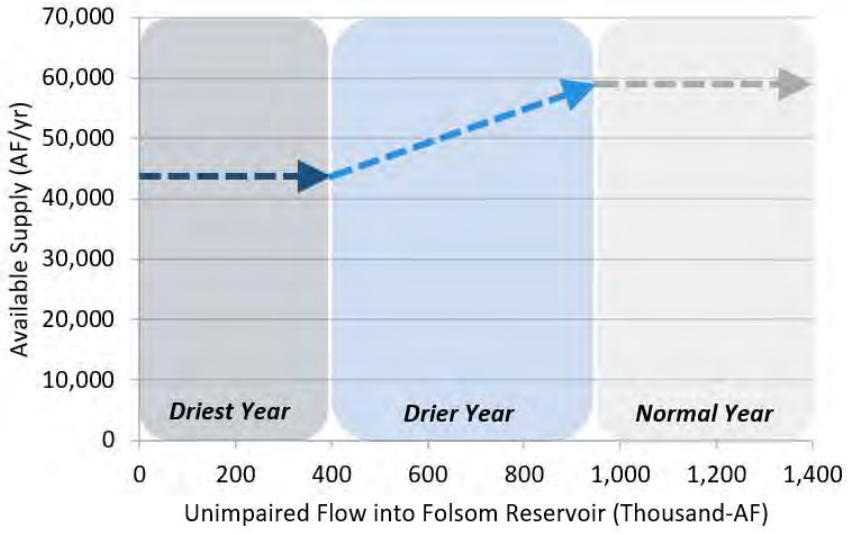


Figure 7-1 Water Forum Agreement Supply Limitations

It is important to note that during the drier and driest years, the City has an agreement with PCWA to release an additional 20,000 AF/yr of water down the American River on the City's behalf through re-operation of PCWA's American River Middle Fork Project (MFP). This 20,000 AF/yr of water is not part of the City's contracted supply of 66,000 AF/yr. The intent of the MFP re-operational releases during drier and driest years is to mitigate environmental impacts resulting from increased diversions above 1995 baseline levels.

7.1.4.2 USBR Operations Criteria and Plan

In addition to the WFA, the City's USBR water is also subject to restrictions as detailed in the 2004 Long Term Central Valley Project Operations and Criteria Plan (location on USBR's website). Chapter 5 of the OCAP entitled "Operations Forecasting" states that CVP allocations can be affected by:

- Forecasted reservoir inflows and Central Valley hydrologic water supply;
- Current amounts of storage in upstream reservoirs and in San Luis Reservoir;
- Projected water demands in the Sacramento Valley;
- Instream and Delta regulatory requirements;
- Annual management of 3406(b)(2) resources (related to fish and wildlife); and/or
- Efficient use of CVP-SWP export capacity through Joint Point of Diversion flexibility.

The OCAP includes a requirement that contractors be informed by USBR no later than February 15 of any possible deficiency in supplies that year. Since 1992, increasing constraints placed on operations by legislative and ESA requirements have made water delivery to CVP contractors more difficult, with recent drought conditions further impacting deliveries. Additionally, it is important to note that the City's USBR water deliveries may be curtailed purely based on downstream Delta conditions, irrespective of available upstream supply.

7.1.4.3 Central Valley and Industrial Water Shortage Policy

Upon a condition of shortage as determined by the OCAP, the CVP M&I WSP details the "incremental steps" by which available M&I water supply is allocated to the CVP water service contractors. From the November 2015 USBR news release, elements of the CVP M&I WSP include:

- Define water shortage terms and conditions for applicable CVP water service contractors, as appropriate.
- Determine the quantity of water made available to CVP water service contractors that, together with the M&I water service contractors' drought water conservation measures and other non-CVP water supplies, would assist the M&I water service contractors in their efforts to protect public health and safety during severe or continuing drought.
- Provide information to CVP water service contractors for their use in water supply planning and development of drought contingency plans.

The Final Environmental Impact Statement (EIS) describes the existing setting, alternatives for future operations under the CVP M&I WSP, and potential environmental impacts of each alternative. USBR selected Alternative 4, the Preferred Alternative, which comprises the Updated CVP M&I Water Shortage Policy developed by USBR with stakeholder input received during preparation of the Final EIS.

The decision will allow USBR the greatest degree of flexibility to address CVP water service contractors' needs during a Condition of Shortage while recognizing that CVP deliveries are subject to the amount of CVP water available. The Updated CVP M&I WSP also provides clarity to the terms, conditions, and procedures of the CVP M&I WSP. A copy of the November 2015 Final Record of Decision is included in Appendix J.

7.2 Water Supply Reliability Assessment

This section addresses the reliability of the City's water supply in average, single dry, and multiple dry water years. The City uses the following water year definitions from the DWR 2020 Guidebook:

COR Table 7-B Reliability Assessment Year Type Characterization

Year Type	Description
Average or Normal Year	A single year or averaged range of years that most closely represents the average water supply available to the Supplier.
Single Dry Year	The year that represents the lowest water supply available to the Supplier.
Five Consecutive Year Drought	The driest five-year historical sequence for the supplier.

The reliability of the potable and recycled water supplies is discussed in the following sections and are compared to the projected potable and recycled water demand.

7.2.1 Potable Water Supply and Demand Assessment

This section provides an assessment of the City's expected water supply and demand for Normal Year, Single Dry Year, and Five Consecutive Year Drought scenarios, based on data available at the time of publication of this UWMP, and discusses the City plans to mitigate potential supply deficits.

The City has identified the following base water years to represent the Year Types:

- **Average or Normal Year**: 2017
- **Single Dry Year**: 2015
- **Five Consecutive Year Drought**: 2011 - 2015

This City has identified these base water years based heavily on lessons learned through the droughts experienced in the last 10 years. In 2017, 100% of the typical contract supply was available, making it a good candidate to represent an average or normal year. In 2015, the City experienced a 75% curtailment of their USBR contract value – a source which had been considered highly reliable until that time. With only a 25% allotment, this represents the lowest experienced water supply level in Roseville's history. The time period between 2011 and 2015 represented multiple years of drought conditions and the lowest average available water supply experienced by the City, and therefore has been identified to represent the five consecutive year drought condition. Supply volumes for base years are provided in DWR Table 7-1.

DWR Table 7-1

Submittal Table 7-1 Retail: Basis of Water Year Data (Reliability Assessment)			
Year Type	Base Year	Available Supplies if Year Type Repeats	
		☐ Quantification of available supplies is not compatible with this table and is provided elsewhere in the UWMP. Location _____	
		☑ Quantification of available supplies is provided in this table as either volume only, percent only, or both.	
		Volume Available	% of Average Supply
Average Year	2017	64,279	100%
Single-Dry Year	2015	49,739	77%
Consecutive Dry Years 1st Year	2011	64,279	100%
Consecutive Dry Years 2nd Year	2012	59,430	92%
Consecutive Dry Years 3rd Year	2013	59,480	93%
Consecutive Dry Years 4th Year	2014	51,531	80%
Consecutive Dry Years 5th Year	2015	49,942	78%
NOTES: Groundwater is not utilized as a significant source of supply until a Drought Stage 3 is declared by the City. Totals include recycled water which is assumed to be available in all year types. All volumes are in AF.			

The City intends to use their groundwater supply differently in different year types. Under Normal Year conditions, the City intends to inject groundwater at an overall net benefit to the aquifer, or at most to extract groundwater up to the amount injected. In times of drought however, as in a Single Dry Year, or multi-year drought condition, the City can and will utilize their groundwater infrastructure as a larger percentage of overall supply. These assumptions and the resulting groundwater availability by year type are outlined in COR Table 7-C.

COR Table 7-C Groundwater Supply Availability by Year Type.

Groundwater Supplies and Management by Year Type					
Well Data	Operational ASR Wells	6	10	11	11
	Total Annual Extraction Capacity	17,600	28,000	32,100	32,100
	Total Annual Injection Capacity	7,000	12,100	14,900	14,900
Year Type	**Assumptions**	**2020**	**2030**	**2035**	**Buildout**
Normal	In a Normal Year, the City would only typically extract less than or equal to the volume injected. The injection window is estimated at **3 months** for the wet season when additional volume might be available, and **90% capacity** would be assumed to account for 10% down time for maintenance.	1,560	2,720	3,350	3,350
Single Dry	In a Single Dry Year, the City would expect to pump for **6 months** of the year at 9**0% capacity** to allow for 10% down time for maintenance.	7,920	12,570	14,430	14,430
Year 5 of a Multi-Year Drought	In the 5th year of a 5 -Year Drought, the City would expect to pump for **6 months** of the year at 9**0% capacity** to allow for 10% down time for maintenance.	7,920	12,570	14,430	14,430
NOTES: All values are in AF.					

The availability of total water supply from each source by hydrologic year type is outlined in COR Table 7-D.

COR Table 7-D Potable Supply Availability by Year Type

Potable Water Supply Availability by Source and Hydrologic Year Type

All values are in AF.

7.2.2 Comparison of Supply and Demand

A comparison of projected water supply and demand during Normal, Single Dry, and Five Consecutive Year Drought conditions are included in DWR Table 7-2, DWR Table 7-3, and DWR Table 7-4. It is important to note that in all scenarios shown in these tables, Normal Year demands are shown. As outlined in Chapter 4 , passive demand reduction savings are incorporated into the demand projections themselves; however, no specific conservation effort to reduce demands in a drought year have been shown in these tables in order to depict the most basic comparison of supply and demand in these year types. As shown, there is an adequate water supply in all normal years. In single dry years and in certain multiple dry years, water supply deficit may occur.

7.2.3 Recycled Water Supply and Demand Comparison

The City's recycled water supply is an important resource as it is considered to be 100% reliable in all water year types. Recycled water supply has been set equal to the projected recycled water demand in these analyses because showing a surplus recycled water supply would mask potential potable water shortages.

7.2.4 Total Water Supply and Demand Comparison

A comparison of projected total (potable and recycled) water supply and demand during a normal water year is included in DWR Table 7-2. As shown, there is an adequate water supply in normal years to meet demands through 2045.

DWR Table 7-2

Submittal Table 7-2 Retail: Normal Year Supply and Demand Comparison					
	2025	2030	2035	2040	2045
Supply totals	64,482	66,055	70,543	70,543	70,543
Demand totals	51,589	56,990	62,547	62,547	62,547
Difference	12,893	9,065	7,996	7,996	7,996
NOTES: An additional 3,360 AF of supply from the PCWA Ophir WTP is assumed to become available in all year types as of 2035. The City plans to have 4 new wells operational by 2030 with an additional 2 following by 2035, as well as the destruction of 1 existing. Supply and demand include Recycled Water. All volumes are in AF.					

A comparison of projected water supply and demand during a Single Dry Year is included in DWR Table 7-3.

DWR Table 7-3

Submittal Table 7-3 Retail: Single Dry Year Supply and Demand Comparison					
	2025	2030	2035	2040	2045
Supply totals*	49,942	55,005	60,723	60,723	60,723
Demand totals*	51,589	56,990	62,547	62,547	62,547
Difference	(1,647)	(1,985)	(1,824)	(1,824)	(1,824)
NOTES: An additional 3,360 AF of supply from the PCWA Ophir WTP is assumed to become available in all year types as of 2035. The City plans to have 4 new wells operational by 2030 with an additional 2 following by 2035, as well as the destruction of 1 existing. Supply and demand include Recycled Water. All volumes are in AF.					

A comparison of projected water supply and demand during a Five Consecutive Year Drought is included in DWR Table 7-4.

DWR Table 7-4

Submittal Table 7-4 Retail: Multiple Dry Years Supply and Demand Comparison						
		2025	2030	2035	2040	2045
First year	Supply totals	64,482	66,055	70,543	70,543	70,543
	Demand totals	51,589	56,990	62,547	62,547	62,547
	Difference	12,893	9,065	7,996	7,996	7,996
Second year	Supply totals	59,582	61,155	65,643	65,643	65,643
	Demand totals	51,589	56,990	62,547	62,547	62,547
	Difference	7,993	4,165	3,096	3,096	3,096
Third year	Supply totals	59,582	61,155	65,643	65,643	65,643
	Demand totals	51,589	56,990	62,547	62,547	62,547
	Difference	7,993	4,165	3,096	3,096	3,096
Fourth year	Supply totals	51,582	53,155	57,643	57,643	57,643
	Demand totals	51,589	56,990	62,547	62,547	62,547
	Difference	(7)	(3,835)	(4,904)	(4,904)	(4,904)
Fifth year	Supply totals	49,942	55,005	60,723	60,723	60,723
	Demand totals	51,589	56,990	62,547	62,547	62,547
	Difference	(1,647)	(1,985)	(1,824)	(1,824)	(1,824)
NOTES: An additional 3,360 AF of supply from the PCWA Ophir WTP is assumed to become available in all year types as of 2035. The City plans to have 4 new wells operational by 2030 with an additional 2 following by 2035, as well as the destruction of 1 existing. Supply and demand include Recycled Water. All volumes in AF.						

As stated in DWR Table 7-4, there is sufficient supply to meet demands in Normal Years through 2045. In Single Dry Years and some extended drought years, shortages do occur. DWR Table 7-2, DWR Table 7-3, and DWR Table 7-4 include recycled water supply and demand. The remaining deficits shown will be mitigated by potable water conservation measures implemented as part of the Water Shortage Contingency Plan.

7.2.5 Deficit Mitigation

Depending on the raw water supply available from USBR, and in accordance with the WFA, deficits in potable water supply may occur in a single dry year or the latter stages of an extended drought condition. As shown in DWR Table 7-3 and DWR Table 7-4, the greatest potential deficit between available supply and demand would occur in Year 4 of a Five Consecutive Year Drought condition.

One potential strategy to alleviate deficiencies shown above is indicated in DWR Table 7-5. In DWR Table 7-5, the potential volume of water resulting from potable water demand reductions are shown.

DWR Table 7-5

Submittal Table 7-5: Five-Year Drought Risk Assessment Tables to address Water Code Section 10635(b)

	2021	2022	2023	2024	2025
Total Water Use	39,172	42,276	45,380	48,484	51,589
Total Supplies	64,279	59,430	59,480	51,531	49,942
Surplus/Shortfall w/o WSCP Action	25,107	17,153	14,100	3,047	(1,647)
Planned WSCP Actions (use reduction and supply augmentation)					
WSCP - supply augmentation benefit	0	0	0	0	0
WSCP - use reduction savings benefit	0	0	0	0	6,659
Revised Surplus/(shortfall)	25,107	17,153	14,100	3,047	5,013
Resulting % Use Reduction from WSCP action	0%	0%	0%	0%	13%

NOTES: Supply and demand totals include Recycled Water. Demand reductions actions only apply to the portion of total water use that is potable and not to the recycled water.

The City will determine the needed balance between water conservation and groundwater pumping on a case-by-case basis consistent with the City's Municipal Code. The City also continues to plan for and analyze opportunities for water supply projects or exchanges that would increase the reliability of the raw water supplies diverted from the American River.

7.3 Regional Supply and Reliability

All water consumed by the City comes from local supply sources. No water is imported from other regions, nor does the City anticipate importing water from other regions throughout the UWMP planning period. However, the City is actively engaged in multiple planning projects and coordination intended to strengthen water supply reliability throughout the Sacramento area, in addition to investing in long-term water storage projects like the future Sites Reservoir. Projects like Sites will not provide direct benefit in terms of water supply to Roseville; however, as a regional project it promises to strengthen the Northern California water portfolio as a whole, providing benefit to all who operate within this sphere. The City is a committed regional partner in working to solve supply shortage issues before they become a critical reality, with climate change and increasingly limited supply sources at the crux of the issue. The City will continue these efforts into the future and work with its partner agencies to find the best path forward.

Chapter 8 Water Shortage Contingency Plan

Following the severe drought of 2012-2016, the State of California Legislature sought to expand the water shortage contingency analysis under former law and mandated that a Water Shortage Contingency Plan (WSCP) be adopted by suppliers. A copy of the WSCP is provided in Appendix K.

Chapter 9 Demand Management Measures

This chapter describes the City's historical and existing water conservation program, status of implementation of Demand Management Measures (DMMs), and projected future conservation implementation. The CWC requires that the UWMP include a comprehensive description of historical, current, and projected water conservation programs.

> *CWC 10631 (e) Provide a description of the supplier's water demand management measures. This description shall include all of the following:*
>
> *(1) (A) For an urban retail water supplier, as defined in Section 10608.12, a narrative description that addresses the nature and extent of each water demand management measure implemented over the past five years. The narrative shall describe the water demand management measures that the supplier plans to implement to achieve its water use targets pursuant to Section 10608.20.*
>
> *(B) The narrative pursuant to this paragraph shall include descriptions of the following water demand management measures:*
>
> *(i) Water waste prevention ordinances.*
>
> *(ii) Metering.*
>
> *(iii) Conservation pricing.*
>
> *(iv) Public education and outreach.*
>
> *(v) Programs to assess and manage distribution system real loss.*
>
> *(vi) Water conservation program coordination and staffing support.*
>
> *(vii) Other demand management measures that have a significant impact on water use as measured in gallons per capita per day, including innovative measures, if implemented.*

In previous UWMPs, a substantial amount of data was required to document a water supplier's progress in implementing fourteen specific DMMs. In 2014, Assembly Bill 2067 simplified, clarified, and updated reporting requirements for DMMs. Starting with the 2015 UWMP, focus has turned away from detailed descriptions of each of the fourteen DMMs and has turned to water conservation measures that are being implemented to achieve compliance with SB X7-7. For retail agencies, the number of DMMs has been reduced from fourteen to six (plus an "other" category). A narrative description of the status of the DMMs and how the DMMs will help the water supplier achieve its SBX7-7 water use targets is required. Detailed data are not required.

Members of the CUWCC may include their reporting in the UWMP, but a narrative is also required.

9.1 Demand Management Measures

The six DMMs required to be discussed in the 2020 include the following:

- Water waste prevention ordinances;
- Metering;
- Conservation pricing;
- Public Education and outreach;
- Programs to assess and manage distribution system real loss; and
- Water conservation program coordination and staffing support.

For each DMM, the current program is described, followed by a description of how the DMM was implemented over the previous five years and the planned implementation to achieve the water use targets required by SB X7-7, which is discussed in Chapter 5

9.1.1 Water Waste Prevention Ordinances

The City currently restricts water waste within its service area. Roseville Municipal Code Chapter 14.09, Water Conservation Ordinance (Appendix L), defines water waste and associated penalties of continued infractions. Per the ordinance, customers in violation are provided a series of notifications at one-week intervals: first a courtesy notice, second an administrative warning, and finally a formal citation. If the situation is not remedied by the time specified in the formal citation, additional measures can be taken to enforce compliance. These measures include fines, water restrictions, low flow devices, or discontinued service. In addition, the City may waive the courtesy notice and administrative warning in times of drought.

To enforce the Water Waste Ordinance, the City employs two 1,500 hour/year conservation workers to patrol within the service area limits. The City has also employed contract help at night to conduct water waste patrols. These patrol efforts are ramped up and down seasonally according to the intensity of landscape water usage. In addition, full-time City staff patrol for water waste as part of their normal job duties. In addition to patrols by City staff, the City has an online reporting mechanism that allows customers to report observed water waste anonymously. Customers can visit www.roseville.ca.us/waterwaste and submit an electronic form, which is then further investigated by City staff.

Implementation of this DMM is ongoing and expected to help the City achieve its water use targets by minimizing the nonessential uses of water so that the water is available to be used for human consumption, sanitation, and fire protection.

9.1.2 Metering

A meter retrofit program was developed and implemented from 2001 to 2011. Implementation of metered rates began immediately on all residential metered connections established after January 1, 2002, with the remaining retrofitted homes transitioned in large blocks as retrofits were completed. Customers were provided water use information for a period of one year before transition to volumetric billing began.

The metering DMM helps Roseville achieve its water use targets by providing accurate water use information to both the customer and the City. Higher than normal comparative usage triggers outreach to customers who may have leaks, as well as awareness of efficient water use practices. Overall, metering assists the City in managing customer water use and leak detection efforts.

9.1.3 Conservation Pricing

As a component of its meter retrofit program, the City adopted conservation pricing for water on all metered accounts from 2011 through 2015. Later, and to comply with Proposition 218 requirements, the City transitioned to a per-use, uniform billing rate structure in February 2016. A complete list of service charges, excess water use charges, and water rates are included in Roseville Municipal Code Sections 14.08.090 Service Charges for Metered Service through 14.08.100 Flat Water Rates. This information is included in Appendix M.

Implementation of this DMM is expected to help the City achieve its water use targets by ensuring water customers pay the true cost of water. The City regularly analyzes this cost of water production, capital improvement project needs, level of service requirements and other costs of operating the water system during regular rate studies. Where adjustments need be made, extensive public education efforts are undertaken to maintain transparency of utility operations and funding to support any required rate changes. Sufficient revenue will continue to be available to fund water system operations, maintenance, and water conservation programs.

9.1.4 Public Education and Outreach

The City promotes water conservation and other resource efficiencies in coordination with the Regional Water Authority (RWA), Roseville Electric, and Roseville's Public Information Department. The City distributes information through paid advertisements, television commercials, featured segments on the local government access channel, the internet (through the City's website and streaming video), the City's Utility Exploration Center, several water efficient workshops each year, movie theater ads, newsletters, bill inserts, mill messages, brochures, vehicle decals, community outreach events, community speaker bureaus, and yearly special events.

9.1.4.1 Customer Water Usage Portal

The City plans to implement a customer portal as part of the implementation of Advanced Metering Infrastructure (AMI) which is currently underway. This portal will provide residents with an ability to view their past usage and identify any changes in use patterns that may indicate leaks or opportunities for implementing cost savings by conserving water.

9.1.4.2 Utility Exploration Center

In 2008, the City's utilities jointly funded and created the Roseville Utility Exploration Center (UEC). In addition to serving as a "storefront" for the utilities, the Center is used by the City for community outreach and environmental education. Designed for an interactive experience, the UEC hosts multiple hands-on exhibits with a "learning lab" for demonstrations, presentations, and workshops. Topics include water conservation and watershed protection, energy efficiency, waste reduction, and wastewater management.

Since opening, the Utility Exploration Center has hosted over 640,000 program participants, with approximately 5,000 student (preschool through sixth grade) to the exhibit hall; partnered with cultural, recreational, and utility-related organizations to create a lively series of changing events, workshops, and activities; and connected with residents in a variety of off-site outreach activities.

The Center is housed within the Gold LEED (Leadership in Energy and Environmental Design) certified Martha Riley Library building, which was the first building in Placer County to be so honored. Future plans include the "Inspiration Garden," an outdoor learning space created in partnership with Roseville's Water Efficiency division, with a goal of encouraging more residents to adopt water-wise gardening practices. The garden is planned for completion by summer 2021. Plans are also underway to update the original visitor center exhibits. A larger outdoor project, originally called the IDEAscape, would further expand exhibits to include topics such as river-friendly landscaping and irrigation, utility systems, solar energy, and watershed protection. The project is currently on hold but is anticipated for completion by 2030.

9.1.4.3 Student Outreach

In addition to Regional Water Authority (RWA) student outreach programs, the City independently provides presentations, conservation materials, and facility tours to local schools.

9.1.5 Regional Water Authority – Outreach and Education

In addition to local public education and outreach programs, the City also participates in a regional public education and outreach program through the Regional Water Authority (RWA). RWA is a joint powers authority formed in 2001 to promote collaboration on water management and water supply reliability programs in the greater Sacramento, Placer, El Dorado, Yolo, and Sutter counties. In collaboration with 19 water provider members and other wastewater, stormwater, and energy partners, RWA formed the Water Efficiency Program (WEP) in 2001 to bring cost effectiveness through economies of scale to public education and outreach activities.

The WEP operates on an average annual budget of $530,000 and is supplemented by grant funding. Grants are an important funding resource for the Program. Since 2003, the Program has been awarded $13.2 million in grant funding for public outreach and education as well as a variety of rebate programs, fixture direct install programs, system water loss, individualized customer usage reports, large landscape budgets and more. Of those funds, $3.8 million was awarded between 2016 and 2020.

The main function of the WEP is to develop and distribute public outreach messages to customers in the region by collaborating with its water provider members. The Program distributes these messages on a regional scale through regional media and advertising buys and was honored with the United States Environmental Protection Agency WaterSense Excellence in Education and Outreach Award in 2016. From 2016-2020, the WEP created a series of public outreach campaigns. A summary of each campaign and highlighted achievements is as follows.

Following the historic 2015 California drought, the WEP launched the “Rethink Your Yard” Campaign in 2016 with a focus on prioritizing landscape watering, putting trees first and transitioning thirsty lawn and landscaping to beautiful, low water use, River-Friendly landscapes. The Program advertised the campaign through online ads, social media, commercial radio, Raley Field (local baseball stadium) and local billboards. The campaign featured local homeowners with their newly redesigned yards on billboards throughout the region.

The campaign launched in 2017 focused on encouraging customers to understand and deliver the amount of water their landscape really needs and to make permanent equipment changes to improve efficiency such as installing weather-based irrigation controllers, more efficient sprinklers and drip irrigation. The Program partnered on this messaging with local nurseries through a “Get Growing this Fall” initiative to encourage residents to plant in the fall when days are cooler and plants don’t need as much water to establish roots.

From 2018 through 2020, the regional campaign focused on tackling the landscape overwatering problem with a “Check and Save” message encouraging residents to check the soil moisture with a moisture meter before turning on sprinklers. To support this message, the Program provided free froggy moisture meters via an online request form and at events. In 2019, WEP distributed 3,000 moisture meters to customers throughout the region.

These campaigns are implemented through both paid advertising buys and earned media from public service announcements (PSAs). Every year the campaigns can be heard on local radio stations such as Capital Public Radio

and online through google, Facebook and YouTube advertisements. From 2016-2020, the WEP public outreach campaigns produced:

- Radio Advertising (2016-2020)
  3,443 radio advertisements ran
  17.2 million impressions

- Digital Advertising (Facebook, Google Display Network and Spotify) (2016-2020)
  24.3 million impressions
  262,900 clicks

- Additional advertising (billboards in 2016)
  1.8 million digital advertisements ran
  51.6 million impressions

- Public Service Announcements (Television and Radio) (2016-2020)
  20 million impressions
  $570,000 in value had they been purchased as advertising

The Program also continues messaging through its own Facebook page. From 2016-2020, the Program created about 60 Facebook posts a year featuring water saving tips and other relevant information. The WEP hosted several Facebook sweepstake contests including: Tree Hugger in 2016, where participates submitted pictures hugging a tree to raise awareness about the importance of healthy trees and the Under/Over Debate in 2020, where participates were asked to weigh in what is the proper way to hang toilet paper to raise awareness of toilet leaks. The winner of the Under/Over Debate sweepstakes received a case of toilet paper delivered via mail and gift card to a local hardware store.

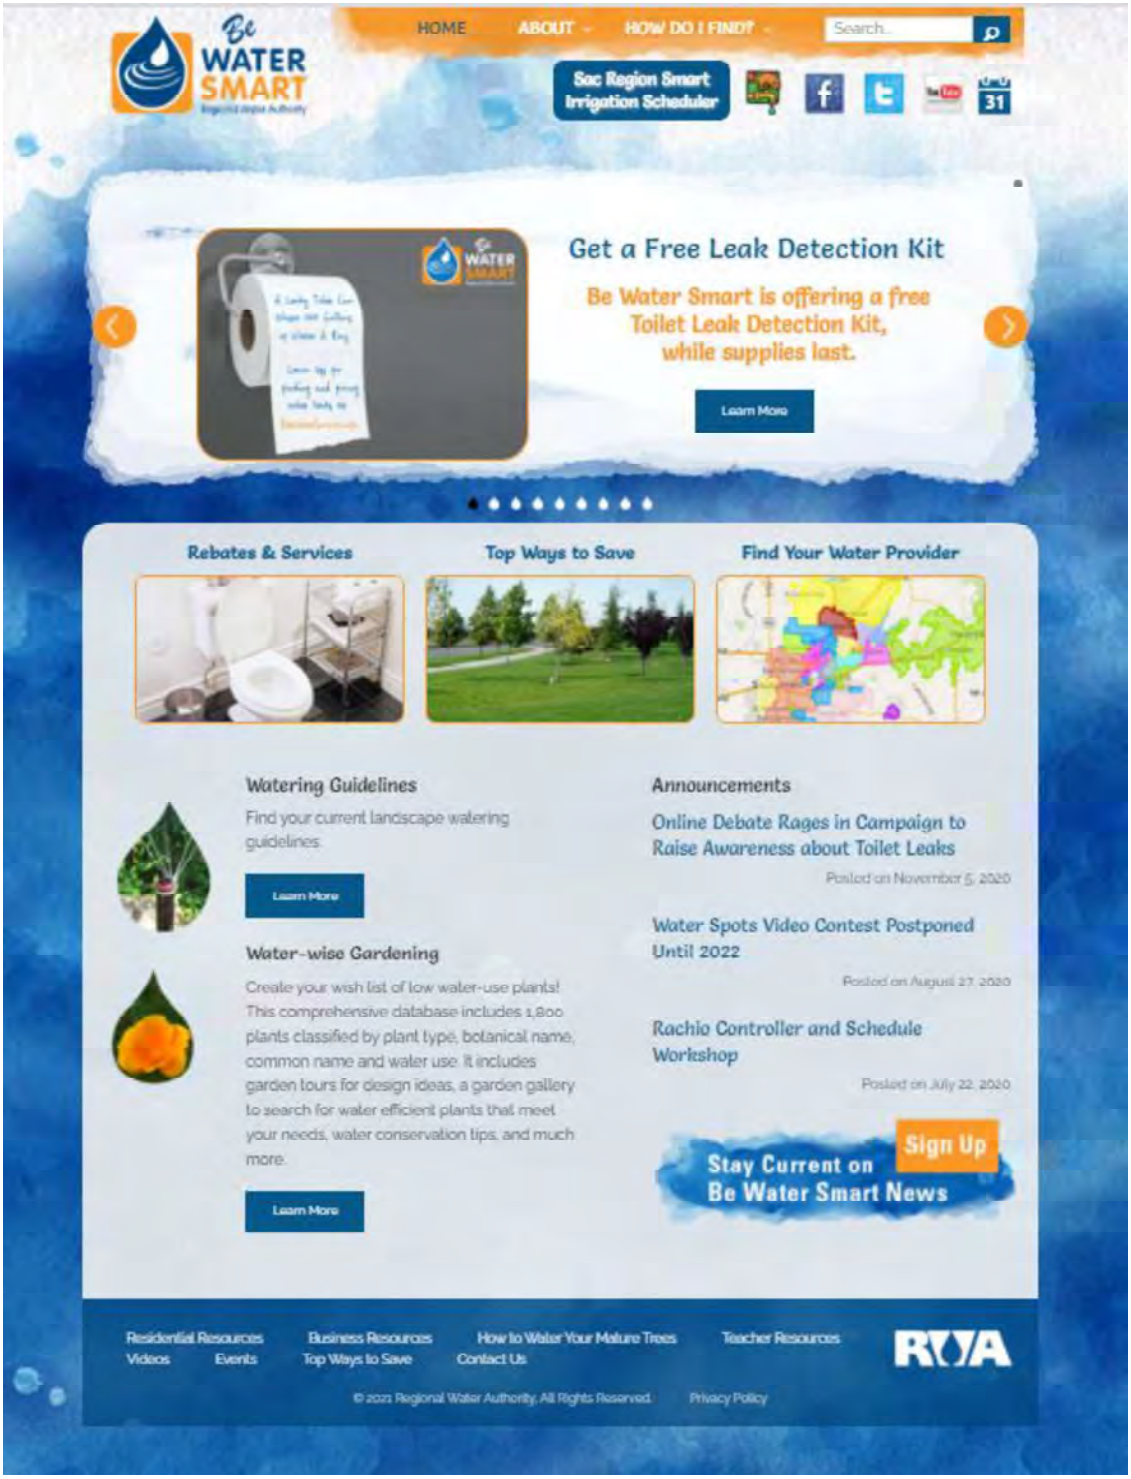
The Program continues to utilize the public outreach website bewatersmart.info to reach customers throughout the region. The website contains regional and local water provider information on rebates and services, top ways to save, an interactive watering and water waste information map, a water-wise gardening database, recent press releases, the Sacramento Smart Irrigation Scheduler tool, and more. Educational information and customer services were modified to address the COVID pandemic in 2020 including online water efficiency lessons for kids, a list of nurseries that offered curbside pickup, virtual water wise house calls and numerous virtual educational customer workshops. Between 2016 and 2020, the website averaged 96,000 unique visitors per year.

For more targeted outreach, the Program distributed quarterly e-newsletters to participating residents. The e-newsletters are filled with water savings tips, upcoming events, and other interesting articles. They are usually timed around changes in the weather to help signal the need for residents to adjust their irrigation systems, such as day light savings coupled with a message to dial back sprinkler systems. The e-newsletter reaches 6,300 households.

Every year the WEP selects 3 public events to attend for the public to interact with local water efficiency staff. These events provide an opportunity for the region to communicate its messages in person. Events have included the Sacramento Home & Landscape Show at Cal Expo, Creek Week, Harvest Day, Farm-to-Fork Festival, and several Earth Day events. Additionally, RWA, in coordination with participating local water providers, hosts an annual

Mulch Mayhem event in which customers can pick up a truck load of free mulch from selected locations throughout the region. All in-person regional events were canceled in 2020 due to the COVID pandemic.

The Program is also very active in communicating to local media outlets such as the Sacramento Bee. Between 2016 and 2020, RWA issued 50 press releases on WEP activities and regionally significant news and participated in nearly 30 radio public affairs interviews. The RWA and the WEP were mentioned in dozens of news articles published by local and regional media outlets both within and outside of the Sacramento region during the same time frame.



To support public outreach messaging and water savings tips, the Program also coordinated several regional rebate programs, which were partially funded by state and federal grants. A variety of rebate options were provided including toilets, clothes washers, and irrigation efficiencies (full summary in COR Table 9-A). Collectively, these rebates and installations will produce an estimated lifetime (10 years) savings of 6 billion gallons of water and 6.4 million kilowatt hours of energy.

COR Table 9-A Regional Rebates and Installations from 2016 through 2020.

Rebate/Installation Type	2016	2017	2018	2019	2020	Lifetime Water Savings per Type 2016-2020 (MG)	Lifetime Energy Savings per Type 2016-2020 (kWh)**
High Efficiency Clothes Washers Rebates	491	480	453	366	518	111.2	118,094
High Efficiency Toilets Rebates	4,494	3,124	2,255	1,868	904	512.3	544,076
Smart Irrigation Controllers Rebates	245	358	801	556	1,298	667.9	709,299
Irrigation Efficiencies Rebates*	21,271	5,879	5,548	1,724	NA	3,786.4	4,021,178
Turf Replacement Rebates (square feet)	376,613	584,535	236,064	85,375	NA	474.6	503,980
Toilet Direct Installation	1,943	4,542	968	NA	NA	237.4	252,066
Showerhead Direct Installation	1,141	2,512	704	NA	NA	222.6	236,447
Faucet Aerators Direct Installation	1,162	4,314	317	NA	NA	18.5	19,648
Urinal Direct Installation	NA	403	73	NA	NA	10.2	10,878
Total Water Savings per year/Lifetime (MG)	285.9	138.2	104.4	42.9	32.8	6,041.1	
Total Energy Savings per year/Lifetime (kWh)**	303,626	146,717	110,915	45,509	34,799		6,415,665
* Includes: pressure regulator equipment, pipe and pipe fittings, drip or low volume equipment, and sprinkler heads or nozzles.							
**Regional average of 1,062 kilowatt hours per MG							
kWh = kilowatt hours							
MG = million gallons							
NA = no funding available							
Lifetime = 10 years							

In addition to public outreach, the Program also coordinates school education activities. Since 2012, the Program has hosted the Water Spots Video Contest for high school and middle school students. The WEP provides a new contest theme each year and provides the region's teacher and students with relevant facts and images to help develop 30 second video PSAs. Students submit their videos to RWA who hosts a panel of local celebrities including Monica Woods from ABC 10 to decide on a first, second and third place winner. The top 10 scoring videos are then posted online for public voting to select a "people's choice" winner as well. Both teachers and student receive cash prizes and the winning videos are played at Raley Field during River Cats games and in select movie theaters throughout the region. The winning PSAs are incorporated into the WEP's media activities as well. Past themes include *WATER MYTHS BUSTED!, H2o Hero, and Show Off Your Water Smarts.* Between 2016 and

2019, 450 videos were submitted (average of 90 videos a year). The 2020 Water Spots Video Contest was canceled due to the COVID pandemic.

9.1.6 Programs to Assess and Manage Distribution System Real Loss

The City maintains a comprehensive water audit and leak-detection program to assess, identify, and repair potable distribution system losses.

In 2009, the City began using AWWA Water Loss software to develop an annual water loss audit. The City continues to employ this method in compliance with Senate Bill 555, validating the annual audit for accuracy prior to submission to DWR each year by the regulatory deadline of October 1. Results from the audit have helped the City identify where in the distribution process leaks are occurring. This information is coupled with detailed pipeline information stored in the City's asset management and GIS system. Audit information helps identify potentially leak prone areas of the City's distribution system for focused rehabilitation or repair projects. The City has recently implemented a proactive auditory leak detection program by City crew members in addition to the audit analyses to identify leaks. Additionally, an independent desktop analysis of potential areas of loss is planned for the coming year. Once these areas are isolated, responses include corrosion monitoring programs, service cathodic protection, relining and/or replacement. The City's asset management software is then updated with identified leaks, which in turn provides more information useful for prioritization of future rehabilitation programs. In 2020, the City began design of a project to rehabilitate 8 miles of water main in the downtown area to improve the function and longevity of the mains, reducing water loss through older pipes in this area of town.

The City also employs a third-party leak detection service on an annual basis to perform focused auditory surveys for leaks, in addition to in-house training and leak detection processes executed by City operations staff throughout their regular maintenance operations. In combination, these measures and projects employed to identify and reduce system leakage offer the City a comprehensive and proactive approach to the reduction of lost water supply.

9.1.7 Water Conservation Program Coordination Staffing Support

In addition to the employees mentioned in Section 9.1.1, the City employs other individuals as members of the City's internal water conservation program team. Member qualifications include: Certified Landscape Irrigation Auditor (CLIA) certification, Water Distribution Operator D-2 certification, and extensive irrigation system management experience.

In compliance with DWR's UWMP guidelines, the cull contact information for the City's Water Conservation Administrator is listed below:

Bobby Alvarez
Water Conservation Administrator
City of Roseville, Environmental Utilities Department
916-746-1710 (office)
BAlvarez@roseville.ca.us

9.2 Other Demand Management Measures

In addition to the six DMMs described above, the City also implements the following programs:

- Residential Water Wise House Calls

- Residential HET Replacement Program
- Residential Irrigation Rebates
- Residential Cash for Grass Rebates
- Commercial Irrigation Water "Budgets"
- Commercial Irrigation Audit
- Commercial Cash for Grass Rebates
- Commercial Custom Rebate
- Commercial Irrigation Improvements Rebates
- Commercial Food Service Water Efficiency Rebates
- Commercial Landscape Water Use Reviews
- Commercial Interior Water Use Audits
- Commercial Water Waste "Night Patrols"
- Commercial HET Replacement Program

These programs are described in Section 9.2.

9.2.1 Residential Conservation Programs

The City implements several programs to reduce the consumption of water to its residents. The activities of these various programs are described in the following subsections. Implementation of these programs is expected to help the City achieve its water use targets by reducing the amount of water consumed by its residential customers.

9.2.1.1 Water Wise House Calls

The City provides a free home water use inspection service known as the Water Wise House Call Program. Inspections are conducted by trained water conservation technicians and help identify potential water savings for the customer.

Single-family inspections are approximately one hour in length and consist of an indoor and outdoor evaluation. During the interior portion of the inspection, the technician measures flow rates of existing plumbing fixtures (offering high-efficiency alternatives if necessary), checks all fixtures and appliances for leaks, and provides information on the City's currently available rebate programs (further described in Sections 9.1.2, 9.1.3, and 9.1.4).

Following the indoor evaluation, the technician then conducts an outdoor inspection. A typical outdoor inspection tests sprinkler system efficiency, distribution uniformity, pool equipment, as well as an evaluation for leaks via pressure test. Following the sprinkler test, soil moisture probes are utilized to optimize irrigation scheduling through adjustment of the residence's irrigation controller.

Finally, water use information is reviewed, and the customer is provided with suggested corrective actions, information regarding the City's rebate programs, and educational material on how to further water conservation.

In addition to local advertising, Water Wise House Calls are actively marketed to high water use customers by the City's Water Efficiency Division. In 2020, modifications were made to this program to adhere to recommended safety procedures in consideration for the global health crisis caused by COVID-19. Adjusted Water Wise House Calls continue to be conducted in a safe manner for both residents and City employees.

9.2.1.2 Residential High Efficiency Toilet Replacement Program

The City first established a HET rebate program in 2008. Residents can receive up to $100 for replacing an older (pre-1992), non-conserving toilet with a new 1.28 gallon per flush model. Rebates are offered on a first come/first service basis to customers on an annual basis, and the program is advertised regularly on Roseville's Channel 11, bill inserts, conservation articles, newsletters, and the City's website. Customers can also obtain an application by request through the mail or at special events and City office public counters.

The City continued this rebate until 2018 when market saturation caused the water savings realized by this program to diminish significantly. This program is currently under reevaluation to determine whether the current terms and conditions bear revision to reinstate the program. Each year new opportunities are explored, and existing rebate programs evaluated for effectiveness as the City works to offer a suite of available opportunities to residents.

9.2.1.3 Residential Cash for Grass

In 2008, Roseville created a turf replacement program titled "Cash for Grass" that provides incentive for customers to replace their turf with water efficient landscaping. Turf is purchased at $1.00 per square foot up to $1,000 per residential site. To comply, participants must not only remove their turf but also install a low-volume irrigation system to irrigate their new water efficient landscape.

9.2.2 Commercial, Industrial, Institutional Conservation Programs

The City implements several programs to reduce the consumption of water to its commercial, industrial, and institutional customers. The activities of these various programs are described in the following subsections. Implementation of these programs is expected to help the City achieve its water use targets by reducing the amount of water consumed by its non-residential customers.

9.2.2.1 Irrigation Water "Budgets"

The City has developed water "budgets" for the majority of its dedicated irrigation accounts (including those owned by the City). These budgets were created using the City's geographical information system (GIS) to determine irrigated landscape area and then field verified for accuracy. The budget reports, produced monthly, show the site's actual water use compared to the estimated water use based on site demographics. If a site's water usage is significantly greater than expected, City staff may request the site's owner complete a site water audit.

9.2.2.2 Irrigation Audit

Similar to Water Wise House Calls, the City provides a free landscape audit service for irrigation customers upon request. Staff evaluates the irrigation system and makes recommendations for improvement. Rebates are available to further incentivize the customer to make improvements to their irrigation systems.

The City will continue to implement this program and will consider expansion based on the past years' participation.

9.2.2.3 Commercial Cash for Grass

Similar to the Residential Cash for Grass Program, the City offers rebates to commercial customers for replacing turf with water efficient landscaping. Commercial customers can receive $2.00 per square foot.

9.2.2.4 Commercial Irrigation Improvement Rebates

The City offers a suite of rebate opportunities for commercial irrigation customers including for conversion to drip irrigation, high efficiency nozzles, self-adjusting controllers, pressure regulators, as well as installation of irrigation submeters for a total potential rebate value of $15,000 for those who meet the established criteria for their projects. Applications for these rebates are easily accessed through the City's website with clear outlines of qualifying equipment and labor for ease of submission.

9.2.2.5 Commercial Food Service Water Efficiency Rebates

The City also offers a series of rebates available to commercial customers in the food service industry, with a "One-Stop Program" through which they can apply for applicable benefits on the purchase and replacement of cooking appliances (steamers and combination ovens), sanitation equipment (dishwashers), as well as refrigeration equipment (ice machines) with improved efficiency.

9.2.2.6 Customized Rebate Program

In addition to the above rebates, the Customized Rebate Program helps commercial, industrial, and institutional customers save money with financial incentives on capital expenditures for retrofit of existing equipment with more water-efficient technologies. This program applies to hardware upgrades including equipment and technology for space cooling, refrigeration, laundry, cleaning, and flushing. The customized rebate amount is derived by measuring current usage of the process compared to the water usage of the new retrofitted process. Water savings are estimated using the number of days operated per year and the expected life of the equipment (capped at 10 years). Total amount of saved water is rebated at $0.50 per 100 cubic feet. Rebates will be paid on a first-come, first served basis until program funds are depleted.

9.2.2.7 Commercial Interior Water Use Audit

The Commercial Interior Water Use Audit assists commercial properties in lowering water, wastewater, and energy costs. A facility review identifies equipment inefficiencies and provides a detailed report of all inefficiencies and corresponding recommendations.

9.2.2.8 Night Patrols

The City has implemented a Night Patrol program during peak water usage months that helps to identify commercial water waste after normal business hours. Patrols are typically conducted several nights per week.

9.2.2.9 Commercial High Efficiency Toilet Replacement Program

Similar to the Residential High Efficiency Toilet Replacement Program, commercial customers can receive up to $175 for replacing an older (pre-1992), non-conserving toilet with a new 1.28 gallon per flush model.

9.3 Planned Implementation to Achieve Water Use Targets

In most instances, helping customers understand the savings that can be achieved and methods available to achieve these savings is enough to motivate change. Through the above DMMs, the City can help customers

identify these savings, which in turn helps the City to achieve its water use targets. Additionally, the City will continue to work with the Parks Department, area school districts, landscape contractors, and property managers to improve water use efficiency.

9.4 Members of the California Urban Water Conservation Council

In 1991 (amended September 16, 1999), an MOU regarding urban water conservation in California was made that formalizes an agreement between DWR, water utilities, environmental organizations, and other interested groups to implement Best Management Practices (BMPs) and make a cooperative effort to reduce the consumption of California's water resources. This MOU is administered by the California Water Efficiency Partnership (CalWEP).

In 1991, Roseville became a voluntary signatory of CalWEP's MOU (formerly the California Urban Water Conservation Council or CUWCC). Since becoming a signatory to the MOU, the City has implemented and promoted its water use efficiency programs to help customers reduce water demand. The City reports to CalWEP on its coverage of the recommended BMPs on a calendar year basis.

The Urban Water Management Planning Act (Water Code Section 10631 (j)) allows for an urban retail water agency that is a signatory member of CalWEP to meet the DMM requirements by documenting that CalWEP has determined the urban water agency is complying (coverage) with all of the provisions of the MOU. Documentation of the City's compliance is provided in Appendix N.

Chapter 10 Plan Adoption and Submittal

This chapter provides information regarding the notification, public hearing, and adoption of the plan.

10.1 Inclusion of all 2020 Data

Because 2020 is the final compliance year for SB X7-7, the 2020 UWMPs must contain data through the end of 2020. If a water supplier bases its accounting on a fiscal year (July through June) the data must be through the end of the 2020 fiscal year (June 2020). If the water supplier bases its accounting on a calendar year, the data must be through the end of the 2020 calendar year (December 2020).

As indicated in Chapter 1, the City uses a calendar year for the water supply and demand accounting, and therefore this 2020 UWMP includes data through December 2020.

10.2 Notice of Public Hearing

The City provided 60-day notice of the preparation of its 2020 UWMP, and the notice of the 2020 UWMP Public Hearing to the cities and counties listed in DWR Table 10-1.

DWR Table 10-1

Submittal Table 10-1 Retail: Notification to Cities and Counties		
City Name	60 Day Notice	Notice of Public Hearing
City of Roseville	☑	☑
County Name	60 Day Notice	Notice of Public Hearing
Placer County	☑	☑

Other agencies notified included the following:

- California American Water
- Citrus Heights Water District
- Placer County Water Agency
- Regional Water Authority
- San Juan Water District
- Sacramento Municipal Utilities District
- Sacramento Suburban Water District
- US Bureau of Reclamation

Public hearing notifications for adopting the Plan were published in the local newspaper (Roseville Press Tribune) and on the City's website. Copies of the published Notice of Public Hearing will be included in Appendix B.

10.3 Public Hearing and Adoption

The City has encouraged community and public interest involvement in the Plan update through the use of public meetings and web-based communication. Copies of the City's outreach efforts are included in Appendix B.

The public hearing will provide an opportunity for all City water users and the general public to become familiar with the Urban Water Management Plan as well as the Water Shortage Contingency Plan and ask questions about its contents. In addition, the hearing presents an opportunity for the public to learn about or comment on the City's continuing plans for providing a reliable, safe, high-quality water supply. Copies of the draft Urban Water Management Plan, including the Water Shortage Contingency Plan, are available for public inspection on the City's website. The public hearing will be held on June 16, 2021.

Copies of the adoption resolutions will be provided in Appendix O, in the final UWMP and WSCP.

10.4 Plan Submittal

A copy of the 2020 UWMP will be submitted to DWR within 30 days of adoption and by July 1, 2021. The adopted UWMP will be submitted electronically to DWR using the WUEdata submittal tool. A CD or hardcopy of the adopted 2020 UWMP will also be submitted to the California State Library.

No later than 30 days after adoption, a copy of the adopted 2020 UWMP, including the Water Shortage Contingency Plan, will be provided to the cities and counties to which the City provides water.

10.5 Public Availability

No later than 30 days after submittal to DWR, copies of this 2020 UWMP will be available for public review at the City's public offices. An electronic copy of this Plan will also be available for review and download on the City's website: www.roseville.ca.us/UWMP.

10.6 Public Implementation

This Plan will be the source document for any Senate Bill 610 Water Supply Assessment or Senate Bill 221 Water Supply Verifications required for any proposed projects between 2021 and 2025 that are subject to the California Environmental Quality Act (CEQA) and would demand an amount of water equivalent or greater than the amount of water by a 500-dwelling unit project. This Plan will also be the source document for water demand projections and water supply availability. Lastly, this Plan will provide guidance and direction on development of new local supplies and implementation of water conservation programs and recycled water expansion to meet the requirements of the Water Conservation Act.

10.7 Amending an Adopted UWMP

If the City amends its 2020 UWMP or the Water Shortage Contingency Plan contained therein, copies of amendments or changes to the plans will be submitted to DWR, the California State Library, and any city or county within which the supplier provides water supplies within 30 days after adoption.

10.8 California Water Code Requirements

Demonstration of compliance with all applicable requirements of the California Water Code pertaining to Urban Water Management Plan and Water Shortage Contingency Plan is provided in Appendix P. Appendix P was developed based on the UWMP Checklist provided in the Guidebook and is organized by subject.

May 25, 2021

Mr. Jeremy Shepard, Director of Technical Services
Placer County Water Agency
PO Box 6570
Auburn, CA 95604-6570

RE: City of Roseville 2020 Urban Water Management Plan Demand Projections

Dear Mr. Shepard:

We sent notice earlier this year to inform you that the City of Roseville (City) Water Utility had begun preparation of the 2020 Urban Water Management Plan. In accordance with California Water Code Section 10631, as the City is a retail water supplier receiving water from your agency, we have provided you with projected water use through 2045 in the below table.

Supply Source	2025	2030	2035	2040	2045
Placer County Water Agency Existing Contracts	30,000 AF	30,000 AF	30,000 AF	33,360 AF	33,360 AF
Placer County Water Agency Future Ophir WTP	–	–	Up to 3.6 MGD	Up to 3.6 MGD	Up to 3.6 MGD

A complete draft of the 2020 Urban Water Management Plan, which is inclusive of the newly required Water Shortage Contingency Plan, can be accessed at www.roseville.ca.us/UWMP. A public hearing of the Water Shortage Contingency Plan and Urban Water Management Plan will be held on June 16th at 6 pm. We encourage you to attend the public hearing which will be held through video conferencing. For information regarding broadcasting of the meeting and providing public comment please visit the City's website at https://www.roseville.ca.us/cms/One.aspx?portalId=7964922&pageId=16870417.

Should you wish to contact the City regarding either of the plans, you may do so by writing or emailing to the undersigned below. Thank you.

Sincerely,

Trevor Joseph, P.G., C.Hg.

The City of Roseville (City) water utility has begun preparing the 2020 Urban Water Management Plan, which must be completed by July 1, 2021. In accordance with California Water Code Section 10642, we are writing to notify you that preparation is underway and to encourage your active input and involvement in the process.

Prior to Board adoption of the plan a public hearing will be held, and we will notify you of the date, time, and location of the meeting. We will also make a draft of the 2020 Urban Water Management Plan available to your agency in advance of the public hearing.

If you wish to contact the City about its review process, you may do so by writing to the undersigned or by email to jtmarks@roseville.ca.us. Thank you.

Sincerely,

Jason Marks

RE: City of Roseville 2020 Urban Water Management Plan

Dear Mr. Lessard:

The City of Roseville (City) water utility has begun preparing the 2020 Urban Water Management Plan, which must be completed by July 1, 2021. In accordance with California Water Code Section 10642, we are writing to notify you that preparation is underway and to encourage your active input and involvement in the process. Additionally, in accordance with California Water Code Section 10631, as we are a retail water supplier receiving water from your agency, we will provide you with projected water use for the next 20 years (up to the year 2040).

Prior to Board adoption of the plan a public hearing will be held, and we will notify you of the date, time, and location of the meeting. We will also make a draft of the 2020 Urban Water Management Plan available to your agency in advance of the public hearing.

If you wish to contact the City about its review process, you may do so by writing to the undersigned or by email to jtmarks@roseville.ca.us. Thank you.

Sincerely,

Jason Marks

RE: City of Roseville 2020 Urban Water Management Plan Public Hearing

Dear Mr. Casey:

We sent notice earlier this year to inform you that the City of Roseville Water Utility (Water Utility) had begun preparation of the 2020 Urban Water Management Plan (UWMP). A draft of the UWMP, which is inclusive of the newly required Water Shortage Contingency Plan (WSCP), has been completed and can be accessed at www.roseville.ca.us/UWMP.

Prior to Board adoption, a public hearing of the UWMP and WSCP will be held on June 16th at 6pm. We encourage you to attend the public hearing which will be held through video conferencing. For information regarding broadcasting of the meeting and providing public comment please visit the City's website at https://www.roseville.ca.us/cms/One.aspx?portalId=7964922&pageId=16870417.

If you wish to contact the Water Utility regarding either of the plans, you may do so by writing to the undersigned or by email to TJoseph@roseville.ca.us. Thank you.

NOTICE OF PUBLIC HEARING
2020 URBAN WATER MANAGEMENT PLAN
AND 2020 WATER SHORTAGE CONTINGENCY UPDATE
CITY OF ROSEVILLE, PLACER COUNTY, CALIFORNIA

NOTICE IS HEREBY GIVEN that the City of Roseville will hold a public hearing on Wednesday, June 16, 2021 at 6:00 p.m. in the City Council Chambers at 311 Vernon Street, Roseville, California, to consider adoption of the City of Roseville 2020 Urban Water Management Plan. The public hearing will also include consideration for adoption of the 2020 Water Shortage Contingency Plan. The Water Shortage Contingency Plan is included as Chapter 8 of the 2020 Urban Water Management Plan.

The Public Review Draft of these documents is available on the City's website at http://roseville.ca.us/UWMP .

LAND USE

PURPOSE

The purpose of the Land Use Element is to set guidelines for managing land use change. Land use designations define allowable density and land uses. The Land Use Map illustrates the location of each of these uses. Goals and policies in this Element guide land use change to achieve many goals: maintaining and enhancing quality of life in neighborhoods; promoting revitalization and economic development; enhancing fiscal sustainability; and ensuring orderly and efficient long-term growth.

A community's ultimate land use distribution and development pattern are influenced by economic development and opportunities, the capacity and location of infrastructure and services, natural and environmental constraints, the periods of time when the community was founded and experienced growth, market opportunities and constraints, and social factors. The implementation of land policies interacts with these and other factors to improve social, economic, and environmental outcomes. Land

use patterns have complex relationships with other key planning considerations. For example, infrastructure capacity and placement can influence the distribution of land uses and the community's overall character. At the same time, the desired community character speaks to the distribution of land uses and the infrastructure necessary to serve these land uses.

It is the overall goal of the Land Use Element to promote a balanced land use pattern that supports innovative land use approaches and retains and enhances the distinct character and identity of Roseville.

GUIDING PRINCIPLES

The City has received input from residents and business owners through surveys, task forces, committee meetings, and other mechanisms. This input was used to develop guiding principles that create the foundation for the goals and policies of the Land Use Element. These guiding principles include:

- Promote and enhance Roseville's unique character and identity.
- Distinguish Roseville from adjacent communities through the quality of development and design and the level of public services and facilities provided.
- Protect and enhance Downtown and the City's established neighborhoods.
- Promote new development and ensure that development is an integrated and connected part of the City's land use pattern.
- Provide a variety of housing types and opportunities to serve the needs and incomes of all households.
- Create a balanced land use pattern with an appropriate mix of uses to accommodate residential, employment, service, and social needs within the community.
- Preserve open space in areas with sensitive environmental resources and provide high-quality, accessible recreational amenities.
- Ensure fiscal responsibility.
- Create a land use mix and development pattern that accommodates and promotes alternative transportation modes for ease of access and improved air quality and public health.
- Proactively manage and plan for growth.

ORGANIZATION

The Land Use Element consists of the Land Use Map and land use goals and policies. The Land Use Map visually illustrates the City's existing and planned land use mix and pattern.[1] Land use decision-making is guided by the goals and policies contained in the text of the Land Use Element, as well as the land use implementation measures outlined in the appendix to the General Plan. While the Land Use Map is an illustration of policy, it only reflects those policies that can be graphically shown. The Land Use Map and land use policies must be used in combination with each other, along with the policies from the other Elements.

[1] A copy of the Land Use Map is available through the Development Services Department - Planning Division at 311 Vernon Street or online at www.roseville.ca.us.

The Land Use Element is organized into the following six components:

1 ***Planning Area*** provides a description of the Planning Area, the Sphere of Influence, and planning subareas.

2 ***Land Use Designations*** identifies and defines the City's land use categories, incorporating general use, development, intensity, and siting and compatibility guidelines.

3 ***Development Forecast*** presents estimates of future development potential within the Planning Area.

4 ***Community Form*** provides goals and policies to define and direct the future form and development pattern of the City.

5 ***Community Design*** includes goals and policies that address aesthetics, integration of the built and natural environments, and community character.

6 ***Growth Management*** focuses on the proactive management of growth in the community, including performance standards to regulate growth and development, as well as policies addressing annexations and expansion of the City's Sphere of Influence.

It is the overall goal of the Land Use Element to promote a balanced land use pattern that supports innovative land use approaches and retains and enhances the distinct character and identity of Roseville.

PLANNING AREA

The focus of the General Plan's land use policy is on the City's "Planning Area" (see Figure II-1), which includes all planning subareas within the City limits, Sphere of Influence, and the City/County Memorandum of Understanding area, as described below.

Sphere of Influence

The City's Planning Area includes 796 acres of land that is within the City's Sphere of Influence, but outside the current City limits. The City does not have jurisdiction over projects proposed within the Sphere of Influence, but will monitor, receive notices, and provide official comments on such projects. The City will use policies of the Growth Management component of this Element to evaluate annexations to the City and expansions of the Sphere of Influence, which would be subject to approval by the Placer County Local Agency Formation Commission (LAFCO).

City/County Memorandum of Understanding Area

The City has an expanded cooperation agreement in place with Placer County, commonly referred to as the City/County Memorandum of Understanding (MOU), which provides guidelines for the City or County to follow to ensure that development within the MOU area is cooperatively planned with input from both agencies.

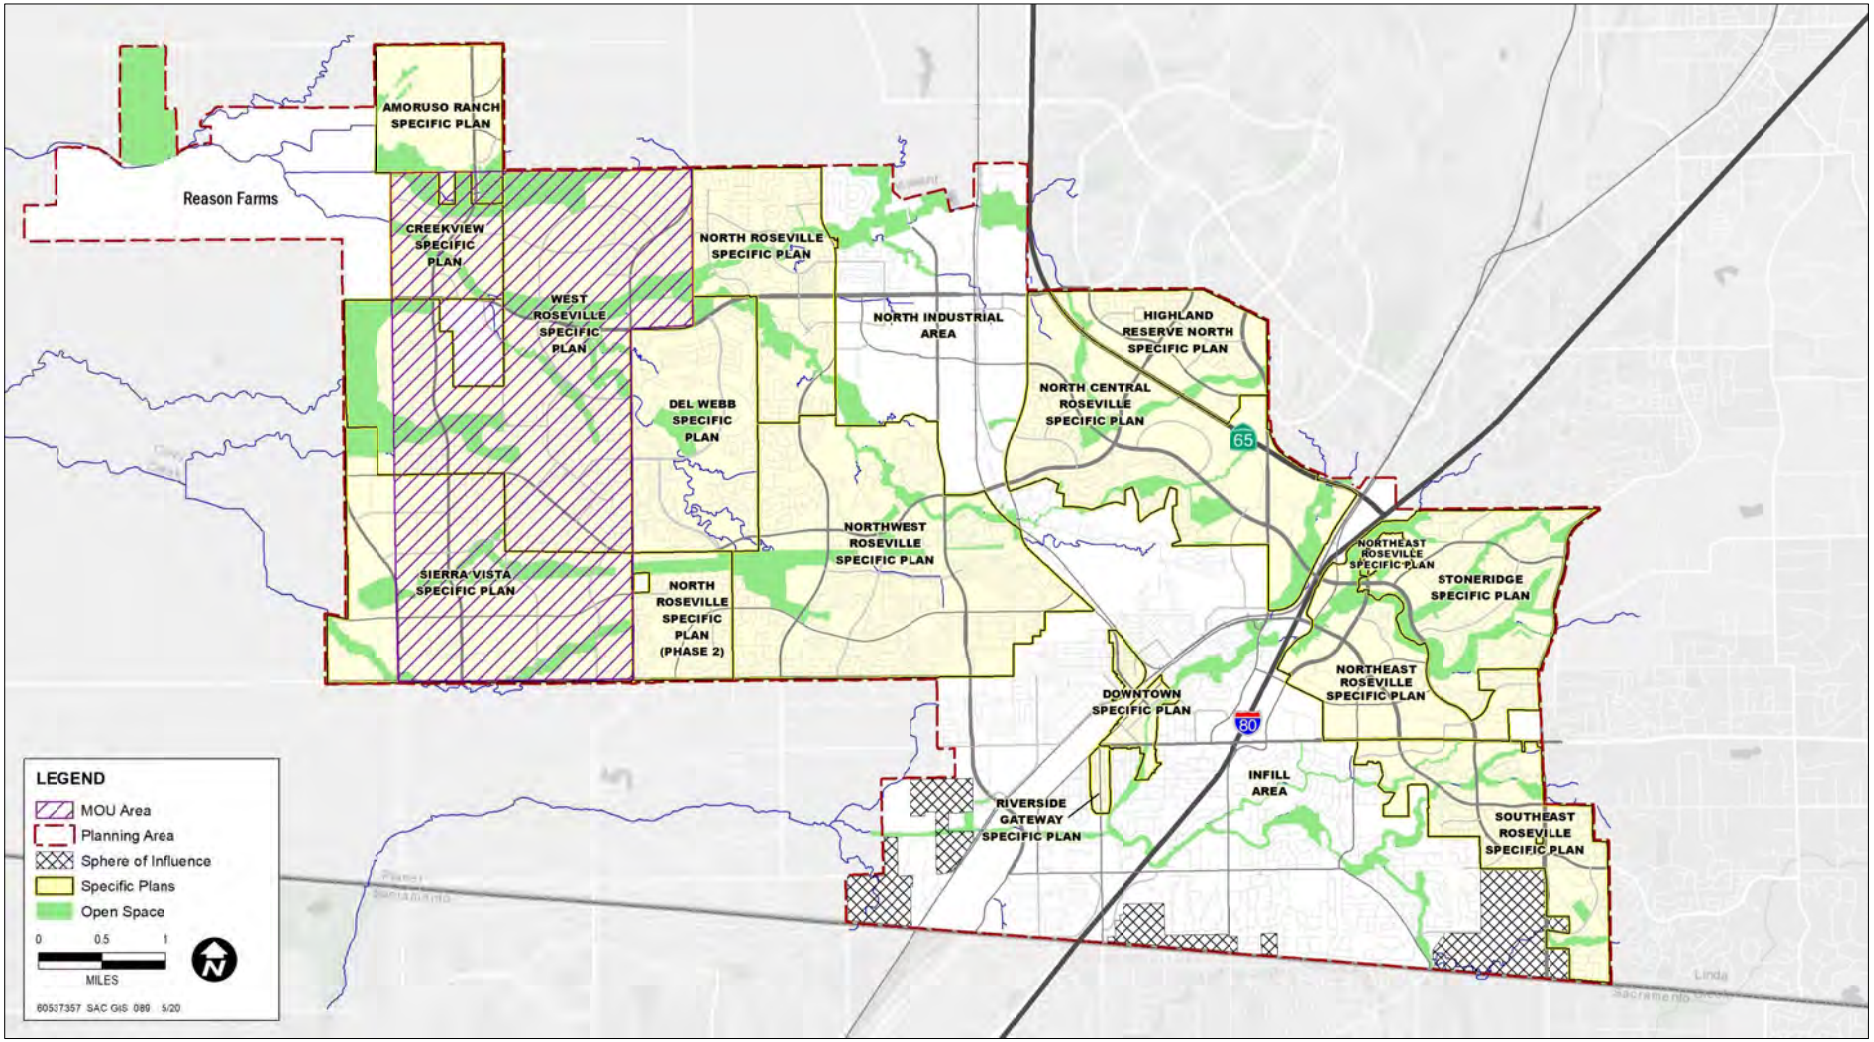
Planning Subareas

Within the City limits, there are 16 subareas that have been defined for planning purposes. These include the Infill Area, the North Industrial Area, and the City's 14 Specific Plan Areas:

- **Infill Area** – This area has vacant and underutilized properties where the City will encourage infill development, but overall, it is mostly built out. The Infill Area includes the historic core of the community but excludes the Downtown and Riverside Gateway Specific Plan Areas.

- **North Industrial Area** – While not subject to a specific plan, this is a recognized planning subarea of the City that provides a major opportunity for industrial and employment development serving the south Placer region. The North Industrial Area has adopted design guidelines, the North Roseville Design Guidelines, which applies to the majority of the planning area. Other portions of the North Industrial Area are regulated by the Hewlett Packard Master Plan or Campus Oaks Master Plan.

- **Southeast Roseville Specific Plan (1985)** – This mixed-use Specific Plan represents the City's first effort to use the specific plan process to master plan a new development area.



- **Northeast Roseville Specific Plan (1987)** – This Specific Plan is primarily intended for commercial and employment-generating uses but also has significant residential and open space components.

- **Northwest Roseville Specific Plan Area (1989)** – The predominant land uses in this Specific Plan Area are single- and multi-family development, but the Specific Plan also provides for commercial, office, open space, and public uses.

- **North Central Roseville Specific Plan (1990)** – This Specific Plan Area includes residential, commercial, and office uses, along with a large area for wetland preservation and creation.

- **Del Webb Specific Plan (1993)** – This Specific Plan Area is planned as an age-restricted community consisting of single-family homes focused around recreational facilities with supportive private and public uses.

Figure II-1 | Planning Areas

This page intentionally left blank

- **Highland Reserve North Specific Plan (1997)** – This Specific Plan accommodates single- and multi-family residential development, along with commercial and other supportive uses.
- **North Roseville Specific Plan (1997)** – This multi-phase Specific Plan includes single- and multi-family dwelling units, commercial uses, parks and other public facilities, and open space.
- **Stoneridge Specific Plan (1998)** – This Specific Plan accommodates single- and multi-family residential development, commercial and office uses, parks and other public facilities, and open space.
- **West Roseville Specific Plan (2004)** – This Specific Plan accommodates single- and multi-family dwelling units, including age-restricted units, commercial uses, industrial development, parks and other public facilities, and open space.
- **Riverside Gateway Specific Plan (2006)** – The Riverside Gateway Specific Plan is intended to guide public improvements and facilitate commercial and residential infill development between Douglas Boulevard and Darling Way.
- **Downtown Specific Plan (2009)** – This Specific Plan encourages mixed-use infill development throughout the Historic Old Town and the Vernon Street District. The associated Downtown Code implements the Plan, physically applying the Plan's guidance to properties within the Plan Area.
- **Sierra Vista Specific Plan (2010)** – This Specific Plan accommodates single- and multi-family units, including age-restricted units, commercial development, parks and other public facilities, and open space.
- **Creekview Specific Plan (2012)** – This Specific Plan accommodates single- and multi-family dwelling units, commercial and office development, parks and other public facilities, and open space.
- **Amoruso Ranch Specific Plan (2016)** – This Specific Plan accommodates single- and multi-family dwelling units, commercial development, parks and other public facilities, and open space.

Roseville's Specific Plans play an important role in guiding development and conservation. In many areas of the City, the Specific Plans are the primary mechanism for implementing the goals and policies of the General Plan. It is the City's policy to plan for new development and/or reinvestment efforts through the Specific Plan process.

The Specific Plans establish detailed policies and implementation programs for portions of the City, consistent with the goals and policies established in the General Plan. Specific Plan land use designations are reflected on the General Plan Land Use Map, although Specific Plans may also use new land use categories that are more specific or tailored to a particular situation. The City's Specific Plans are consistent with, and are hereby incorporated by this reference, as a component of the Land Use Element of the General Plan. Copies of all of the City's Specific Plans may be obtained through the Development Services Department in the Civic Center at 311 Vernon Street or online at: www.roseville.ca.us.

LAND USE DESIGNATIONS

The City's land use designations define allowable land use, and serve as a guide for zoning, Specific Plans, and other land use regulations. Each land use designation has density and intensity guidelines (Table II-3 and II-4), which are used for planning of facilities (e.g. roadway, utilities, schools, parks, etc.) that support the various land uses, as directed by goals and policies in other Elements. The Land Use Map (Figure II-2) illustrates the location of the City's land use designations. The City's land use designations include:

Residential

- Low-Density Residential (0.5 – 6.9 Dwelling Units/Acre)
- Medium-Density Residential (7.0 – 12.9 Dwelling Units/Acre)
- High-Density Residential (13.0 Dwelling Units/Acre or greater)

Commercial

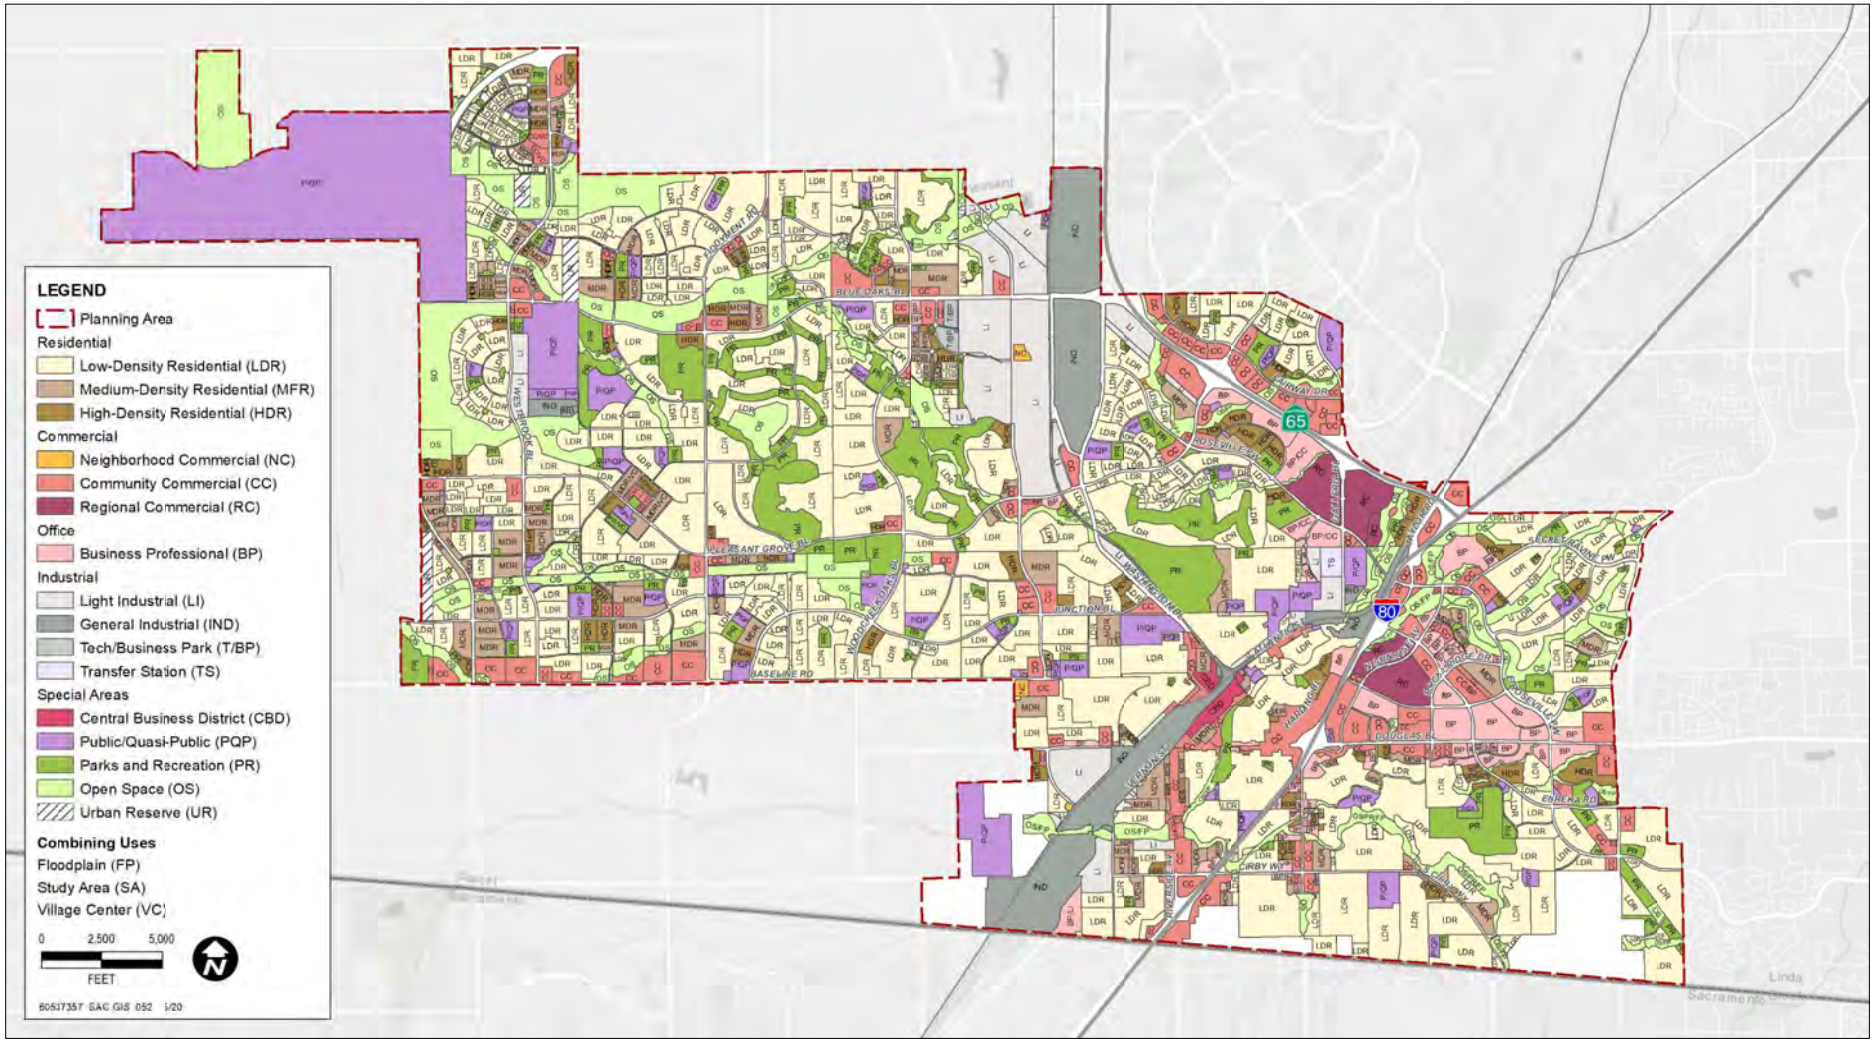
- Neighborhood Commercial
- Community Commercial
- Regional Commercial

Office

- Business Professional

Industrial

- Light Industrial
- Tech/Business Park
- General Industrial
- Transfer Station



Special Areas

- Central Business District
- Public/Quasi-Public
- Parks and Recreation
- Open Space
- Urban Reserve

Combining Designations

- Floodplain
- Study Area
- Village Center

Figure II-2 | Land Use Map

This page intentionally left blank

Compared to zoning, the City's land use designations define allowable land use broadly, in part to provide the flexibility necessary to achieve the General Plan's policies related to pedestrian orientation and convenience and facilitate mixed-use, infill development. For example, in addition to primary uses, there are permitted secondary uses associated with each land use designation that allow for a more diverse land use mix. The Zoning Ordinance, Specific Plans, and Community Design Guidelines provide more specific standards to ensure compatibility among adjacent land uses. The extent of the secondary uses permitted and conditions related to their use will be as specified in the overlying zoning, Specific Plan, and/or other master plan.

Typically, a single land use designation is applied to a given area. However, to promote mixed-use development, the City may use two or more designations for certain areas that include complementary land uses. Because the Land Use Map provides a guide for future development, it is possible that more than one zoning district may be consistent with any one land use designation.

The City's land use designations define allowable land use broadly, in part to provide the flexibility necessary to achieve the General Plan's policies related to pedestrian orientation and convenience and facilitate mixed-use, infill development.

Use Types, Density, Intensity, and Compatibility

Land use designations contain development guidelines to be applied to each use. These include density guidelines for residential uses, intensity guidelines for non-residential uses, and, where appropriate, land use compatibility guidelines. Tables II-1 and II-2 summarize density and intensity guidelines. Tables II-3 through II-8 describe the purpose, allowable uses, and development guidelines for land use designations. Table II-9 is a compatibility matrix for all land use designations. Table II-10 illustrates the relationship between land use designations and implementing zoning districts.

Table II-1 | Residential Land Use Characteristics

Land Use Category	Dwelling Units Per Acre	Estimated Population Per Gross Acre[1]
Low-Density Residential	0.5 TO 6.9	1.45-20.01
Medium-Density Residential	7.0 TO 12.9	20.3-37.41
High-Density Residential	13.0 +	27.3+

[1] Assumes 2.1 persons per multi-family unit and 2.9 persons per single-family unit based on the American Community Survey (2013 - 2017). The estimated population per gross acre is only an estimate and does not represent City policy.

Table II-2 | Non-Residential Land Use Characteristics

Land Use Category	Floor Area Ratio*	Typical Acreage	Typical Square Footage
Neighborhood Commercial	20% TO 40%	Less than 5	< 50,000
Community Commercial	20% TO 40%	5 to 25	50,000 TO 250,000
Regional Commercial	20% TO 40%	>25	>250,000
Business Professional	20% TO 40%	Varies	Varies
Light Industrial	20% TO 50%	Varies	Varies
Tech/Business Park	20% TO 50%	Varies	Varies
General Industrial	20% TO 50%	Varies	Varies
Transfer Station	Varies	Varies	Varies
Central Business District	Up to 300%	Varies	Varies
Public/Quasi-Public	Varies	Varies	Varies

* Floor Area Ratios (FARs) are intended as guidelines and not as absolute restriction

RESIDENTIAL LAND USES

The residential designations include areas designated for a broad array of housing types with different densities. Each residential designation includes a purpose statement, primary and secondary uses, and development guidelines for each designation.

The Low-, Medium-, and High-Density land use designations are based on the number of allowable dwelling units per gross developable acre. A gross developable acre is defined as the land designated as residential use excluding overhead power lines and their easements, areas within the designated 100-year floodplain, and for the Low- and Medium-Density land use designations, any right-of-way and landscape corridors associated with collector and arterial roadways.

Each residential land use designation is indicated on the Land Use Map as an abbreviation (e.g., LDR) and will be followed by a number, indicating the number of dwelling units per gross developable area (e.g., LDR-6.0). Roseville generally uses the Specific Plan or master planning process to establish land use designations. Minimum and maximum densities for each residential land use designation are included within the development guidelines listed for each designation.

Each residential designation includes both primary and secondary land uses. As expected, the primary land uses are residential in each of these designations, but also include public parks, resource preservation and open space areas, and landscape corridors and other public utility easements. Secondary uses include those uses such as schools, places of worship, private recreation, limited office, and childcare facilities – uses that are normally associated with residential areas and are of such a limited size that a separate or distinct land use designation (e.g., public facility or commercial) is not always warranted.

Table II-3 outlines the purpose, allowable uses, and development guidelines for the residential land designations.

NON-RESIDENTIAL LAND USES

The non-residential designations include areas designated for commercial, office, industrial uses, special areas, and combining districts. Like the residential designations, each non-residential designation includes a purpose statement, primary and secondary uses, and development guidelines for each designation.

Intensity development guidelines for non-residential development are expressed as floor area ratios (FARs). This is a ratio of the total floor area (including all floors and not just the "footprint" of a building) divided by the total lot or parcel area. The City expresses this ratio as a percentage. Typical commercial FARs range from 20 to 50 percent, but may be as high as 300 percent (i.e. a three-story building covering 100 percent of the lot area) in locations such as downtown Roseville.

Intensity and compatibility guidelines for the commercial, office, and industrial land use designations are guidelines and not absolute restrictions. Factors such as General Plan policies, intensity of use, anticipated traffic levels, and availability of public facilities and infrastructure will be assessed as part of the development review or Specific Plan process to determine the appropriate level of floor area to land area ratio.

Unlike the specific secondary uses listed in the residential designations, which are intended to be subordinate and may be permitted only to support neighborhood convenience, the relationship of secondary uses in non-residential areas differ. It is the intention of the non-residential land use designations to permit secondary land uses that support and complement primary uses. These secondary land uses do not need to be subordinate. The size of these areas would typically be limited and would, therefore, not warrant a separate land use designation for the secondary land use. Tables II-4, II-5, and II-6 outline the purpose, allowable uses, and development guidelines for the non-residential land designations.

SPECIAL LAND USE DESIGNATIONS

In addition to the residential, commercial, office, and industrial land use designations, the City has also established Special Land Use Designations for Central Business Districts, Parks and Recreation, Open Space, public uses, and Urban Reserve Areas. Table II-7 outlines the purpose, allowable uses, and development guidelines for the Special Land Use Designations.

COMBINING DESIGNATIONS

These designations are only applied in combination with another land use designation and modify the uses and development guidelines of that designation. Table II-8 outlines the purpose, allowable uses, and development guidelines for the Special Land Use Designations.

Table II-3 | Residential Land Use Designations

Designation	Purpose	Primary Uses	Secondary Uses	Development Guidelines
Low-Density Residential (LDR)	Applies to lands where single-family dwelling units, which comprise the majority of Roseville's housing supply, are located. Assigned to lands with the flexibility to accommodate development constraints (e.g., slopes, trees, etc.). Typically, low-density residential lands should require minimal grading or disturbance of natural features. Avoidance of land use limitations (topography, vegetation, easements, etc.) can be achieved by designing larger or smaller lots or by clustering and attaching units.	Attached and detached single-family residences, public parks, resource preservation and open space areas, landscape corridors, and other public utility easements.	Secondary uses include accessory dwelling units, public and private schools, religious assembly, private recreation, and limited office, commercial childcare facilities, and neighborhood retail and services.	0.5 to 6.9 dwelling units per gross developable acre. Lot sizes average 6,000 to 7,500 square feet but may be larger or smaller.
Medium-Density Residential (MDR)	Applies to lands characterized by small-lot single-family detached dwelling units and attached patio homes, halfplexes, duplexes, townhouses, condominiums, and mobile home parks. Should accommodate a variety of housing types and designs. Often located as a transition between higher-intensity land uses and low-density residential uses.	Attached and detached single-family, halfplexes, duplexes and multi-family residences; and public parks, resource preservation and open space areas, landscape corridors and other public utility easements.	Secondary uses include accessory dwelling units, public and private schools, religious assembly, private recreation, and limited office, commercial childcare facilities, and neighborhood retail and services.	7.0 to 12.9 dwelling units per gross developable acre.
High-Density Residential (HDR)	Provides for apartments or condominiums with multiple-story structures containing multiple attached dwelling units. The broad range of densities in this category will yield a variety of design options. May be combined with commercial uses to form a mixed-use development where higher densities could be desirable and beneficial.	Multiple-family dwellings in attached units and public parks, resource preservation and open space areas, landscape corridors, and other public utility easements.	Secondary uses include public and private schools, religious assembly, private recreation, and limited office, commercial childcare facilities, and neighborhood retail and services.	13.0 and above dwelling units per gross developable acre. Should be applied to lands adjacent to bicycle and transit corridors, and in close proximity to services.

Table II-4 | Non-Residential Land Use Designations: Commercial

Designation	Purpose	Primary Uses	Secondary Uses	Development Guidelines
Neighborhood Commercial (NC)	Provides basic commercial retail and services for the convenience of surrounding neighborhoods within walking distance of major residential areas.	A limited range of goods and services intended for the convenience of the residents in the immediate neighborhood and compatible with adjacent land uses.	Medical offices, veterinary clinics, other professional offices and commercial child care facilities.	Goods and services may be provided in stand-alone buildings or in small centers, typically on parcels less than five (5) acres in size with a floor area ratio between 20% and 40%. Developments will have a pedestrian scale and orientation and provide convenient pedestrian and bicycle access to reduce the need for an automobile trip. Should be adjacent to collector and/or arterial streets, and residential neighborhoods.
Community Commercial (CC)	Provides a broader range of goods and services to an expanded service area.	Retail stores and businesses selling a full range of goods and services including auto sales and repair, and commercial child care facilities.	Professional offices uses, including medical offices and clinics.	Due to the larger service area, the acreages are larger than in the neighborhood commercial land use category. Typically, the acreages range from 5 to 25 acres, the square footage ranges from 50,000 to 250,000 square feet, and the floor area ratio ranges from 20% to 40%. Should be located at intersections of, or adjacent to arterials.
Regional Commercial (RC)	Accommodates the larger shopping centers and commercial activities where uses provide goods and services to a citywide and regional service area.	Major department and discount stores, auto malls, hotels and motels, and commercial recreation or entertainment.	Office and financial institutions.	Typically, Regional Commercial developments would encompass more than 25 acres. Should be located adjacent to and with immediate access to major transit linkages, arterials, regional roadways, and highways. Sites should possess good automobile and truck access. Shopping centers in the regional commercial land use would typically exceed 250,000 square feet with a floor area ratio between 20% and 40%.

Table II-5 | Non-Residential Land Use Designations: Office

Designation	Purpose	Primary Uses	Secondary Uses	Development Guidelines
Business Professional (BP)	Provides areas for small and large office uses, including uses supportive of offices.	Administrative, professional, government, and medical offices, and research and development (not including any manufacturing or assembly). Hospitals, clinics, and general medical may also be permitted.	Limited service commercial uses (e.g., banks, restaurants, commercial day care centers, travel agencies, florists, etc.) are encouraged where they would minimize the need for vehicle travel for convenience trips but only as secondary uses in proximity to large office parks and complexes. In association with clinics and hospitals, general medical, pharmacies and other medical related retail may be permitted.	Offices developed in stand-alone buildings or in a business park or campus setting. The business professional land use designation may be applied to lands that are adjacent to regional and community commercial designated lands. May also be used as a buffer between residential areas and arterials, community commercial, and light industrial. Floor area ratios should range between 20% and 40%.

Table II-6 | Non-Residential Land Use Designations: Industrial

Designation	Purpose	Primary Uses	Secondary Uses	Development Guidelines
Light Industrial (LI)	Applies to lands reserved for office, industrial, and research and development uses that generate very limited noise, vibration, odor, dust, smoke, light, or other pollutants, and are either integrated or compatible with surrounding uses.	Research and development (which may include manufacturing and assembly), electronics assembly, warehousing, intensive commercial uses (e.g., auto body repair, landscaping material sales, retail and wholesale lumberyards), and associated administrative offices.	Limited service commercial uses (e.g., banks, restaurants, commercial day care centers, travel agencies, florist, etc.) are encouraged where they would minimize the need for vehicle travel for convenience trips, but only as secondary uses. Service uses with large space requirements, such as health clubs, religious assembly, dance and gymnastic studios, and off-peak public assembly uses may also be permitted.	Floor area ratios range from 20% to 50%. Should be located adjacent to major roadways with convenient truck access to accommodate the needs of the businesses that require this land use.

Table II-6 | Non-Residential Land Use Designations: Industrial (Cont.)

Designation	Purpose	Primary Uses	Secondary Uses	Development Guidelines
Tech/Business Park (T/BP)	A variant of the LI designation and is envisioned as more of a campus type use. The land use designation provides for a mix of uses that are compatible with and act as a transition between the light industrial use types and commercial and residential uses.	Allowed use types include professional offices, light manufacturing, research services, and light wholesale and distribution.	Limited service commercial uses (e.g., banks, restaurants, commercial day care centers, travel agencies, florist, etc.) are encouraged where they would minimize the need for vehicle travel for convenience trips but only as secondary uses. Service uses with large space requirements such as health clubs, religious assembly, dance and gymnastic studios, and off-peak public assembly uses may also be permitted.	Floor area ratios range from 20% to 50%.
General Industrial (IND)	Provides areas for industrial uses that tend to generate noise, vibration, odor, dust, smoke, light, and an aesthetic appearance not compatible with residential and other sensitive receptors. The intent of this category is to provide a place for industrial uses within the City that is properly buffered from other uses.	A wide range of activities, including manufacturing, wholesale distribution, large storage areas and other industrial uses, are permitted.	Incidental retail and service commercial uses associated with large employment areas and industrial parks.	Areas developed under this designation should be located with direct access to a major or minor arterial or both, freeways, or rail lines. Floor area ratios range from 20% to 50%.

Table II-6 | Non-Residential Land Use Designations: Industrial (Cont.)

Designation	Purpose	Primary Uses	Secondary Uses	Development Guidelines
Transfer Station (TS)	Reserves and protects industrial areas that may be suitable for a solid waste transfer station.	Intermediate waste handling facilities where solid waste is transferred from hauling vehicles to a transfer vehicle where the waste or portion thereof undergoes processing, recycling, or further handling before transport to a disposal site, waste processing facility, or other facility.	None.	Only be applied where all of the following is satisfied: • All adjacent land use designations are General Industrial or Light Industrial; • All areas within 200 feet of the transfer station facility property shall be zoned such that the transfer station facility use is protected from incompatible adjacent uses; • The area has access from major arterials capable of providing access for transfer vehicles and the public; and • The use of the area as a transfer station facility is consistent with the existing or planned character of the area. Transfer stations shall be designed and maintained to, at a minimum, include enclosed processing areas, paved access, fenced and screened storage areas for recycled goods, dust mitigation, and be in compliance with other City, county, state, and federal standards.

Table II-7 | Special Land Use Designations

Designation	Purpose	Primary Uses	Secondary Uses	Development Guidelines
Central Business District (CBD)	Accommodates significantly greater intensities and traditional mixed retail, office, and apartment uses. Limited in its application to Downtown Roseville but may be applied to areas of greater urban intensity.	A mix of retail and office uses, including municipal offices, public assembly, theaters, and restaurants.	Medium-density and high-density residential uses.	Floor area ratios may be as high as 300% (three times the site area).
Park and Recreation (P/R)	Accommodates public parks and public and private recreation facilities.	Public park and recreation facilities, including ball diamonds and fields, golf courses, pools, bike trails and community buildings; and private recreation uses when they include outdoor facilities, such as golf course, tennis courts, and similar uses.	Libraries, child/elder care facilities, resource mitigation, and drainage detention.	For public recreation, the Parks and Recreation Element contains policies and standards that establish locational criteria, acreage requirements, and the types of improvements planned for each of the City parks.
Open Space (OS)	Preserves and protects public and private lands that are significant due to wildlife habitat, natural features, or flood hazard. Within new development areas, the 100-year floodplain will be designated as Open Space. Sensitive or unique natural features, including, but not limited to, wetlands, vernal pools, and oak woodlands are also to be designated as Open Space as part of specific plans and other major development review processes.	Preserved natural lands, passive recreation and minor recreation facilities (picnic tables, restrooms), walking and bike trails, and resource interpretive facilities.	Resource mitigation and drainage detention.	All permitted uses shall be compatible with the preservation and protection of open space values (habitat and visual) and shall comply with the policies and standards contained in the Open Space and Conservation Element.
Public/Quasi-Public (P/QP)	Establishes areas for education, religious assembly, governmental offices, municipal corporation yards, and water treatment plants.	Municipal, governmental or public facilities, places of worship, and related uses.	None.	This land use designation shall apply to all municipal facilities and may also be applied to quasi-public facilities where the size of such facilities warrants an individual land use designation.

Table II-7 | Special Land Use Designations (Cont.)

Designation	Purpose	Primary Uses	Secondary Uses	Development Guidelines
Urban Reserve (UR)	Applies to those lands that are anticipated to receive urban land entitlements, but at the present time, are constrained by growth management policies, availability of services or other limitations.	Agriculture, open space, passive recreation and resource protection.	Caretakers' residence.	A caretaker's residence may be established at a density of 1 unit per 300 acres. Prior to the allocation of any urban land use entitlements, the applicable constraints must be resolved, consistent with the policies contained in the Growth Management component of this Element.

Table II-8 | Combining Designations

Designation	Purpose	Permitted Uses and Guidelines
Floodplain (FP)	Identifies lands that are within the regulatory floodplain boundaries as defined in the Safety Element. Development is strictly regulated by the City. In areas with existing development, the floodplain designation is an overlay or a combining land use. As part of a specific plan, the land use designation may be combined with an open space or parks designation, if found consistent with the policies of the Safety Element.	Uses are limited to those that minimize flooding impacts on upstream and downstream areas and are consistent with both the policies of the Safety Element and the underlying land use designation.
Study Area (SA)	Identifies future General Plan or neighborhood study areas. This combining designation may be applied to any area, in which the City believes that additional land use analysis and amendment of the General Plan may be desirable to resolve specific neighborhood or land use issues.	Concurrent with a Land Use Map amendment to apply this combining designation, the City shall also adopt an ordinance regulating interim land use development. Such regulations shall relate to the land use issue that requires such regulations and shall include an expiration date.
Village Center (VC)	Allows for a mix and density of land uses common to a traditional downtown, urban setting. Allows for flexibility and deviation from the development guidelines and permitted uses contained in the primary land use designation for which it is combined.	Use of this combining designation requires comprehensive land use planning through approval of a Specific Plan. The permitted uses, development guidelines, and extent of deviation are to be defined in the Specific Plan.

▒ Conditionally Compatible
□ Not Compatible

BP = Business Professional
CBD = Central Business District
CC = Community Commercial
HDR = High Density Residential
IND = General Industrial
LDR = Low Density Residential
LI = Light Industrial
MDR = Medium Density Residential
NC = Neighborhood Commercial
OS = Open Space
P/QP = Public/Quasi Public
P/R = Park and Recreation
RC = Regional Commercial
T/BP = Tech/Business Park
UR = Urban Reserve
VC = Village Center

Note: or purposes of this table, “adjacent” includes land uses separated by collectors and local streets but does not include land uses separated by major arterials or highways or by a buffer greater than 50 feet defined as open space, parks, paseos, or landscape setbacks, provided the adjacent use is not heavy industrial or manufacturing.

Table II-10 | Land Use Designations, Special Areas, and Combining Designations and Implementing Zones

LAND USE DESIGNATION	IMPLEMENTING ZONES
Low-Density Residential (LDR)	R1, R2, RS, RMU, PD
Medium-Density Residential (MDR)	R2, R3, RS, RMU, PD
High-Density Residential (HDR)	R3, RM, PD
Neighborhood Commercial (NC)	NC, PD
Community Commercial (CC)	NC, CC, PD, GC, HC, CMU
Regional Commercial (RC)	CC, RC, GC, PD
Business Professional (BP)	BP, PD
Light Industrial (LI)	M1, MP, MMU, PD, CMU
General Industrial (IND)	M1, M2, MMU, MP, PD, CMU
Central Business District (CBD)	HD, CBD, R3, RMU, P/QP, CMU, BP, NC, PR, OS, PD
Public/Quasi-Public (P/QP)	P/QP, PR, OS, UR, PD
Parks and Recreation (P/R)	PR, P/QP, OS, UR
Open Space (OS)	OS, P/QP, PR, UR
Urban Reserve (UR)	OS, P/QP, PD, UR, PR
Tech/Business Park (T/BP)	BP, MMU, CMU, MP, M1
Village Center (VC)	R1, R2, R3, RS, CC, CMU, PD, NC

Note: Land use designation implementation is not necessarily limited to these zones, especially when combined with an RS or PD zone. Additional zones may be consistent for transitional or interim land uses consistent with General Plan policies. Mixed land use designations may require a variety of land use designations, overlay and/or a PD zone.

Implementing Zones Legend

DEVELOPMENT FORECAST

The City can influence the pace of development and the number of dwelling units, building square footage, jobs, population, and other characteristics of development through General Plan policy and implementing actions. The pace and nature of buildout of the General Plan is also dependent on factors outside of the City's control, including, but not limited to:

- Global, national, state, and regional economic conditions
- Federal budget and regulatory actions
- State budget allocations, relevant policy direction, and regulatory actions
- Perceptions about the quality of life in the region
- Housing costs, demographic trends, and community character
- Job and educational opportunities
- Infrastructure, resource, and land availability and cost

While it is difficult to accurately predict the amount and pace of long-term development, it is important for long-range plans to provide such estimates. The location, timing, and financing for infrastructure and public facilities depend on these forecasts. They also allow communities to assess land availability for different housing types and inform updates to plans that are needed as demand and capacity for different housing types change over time. Estimates of development capacity also allow the City to assess whether it can accommodate existing and future needs for non-residential development.[2] Development forecasts are used in the City's environmental impact analysis and inform mitigation measures that are needed to reduce or avoid such impacts.

With buildout of the General Plan, the City is estimated to have a total population of approximately 198,000, with approximately 75,200 dwelling units, 60 million square feet of non-residential building square footage, and between 120,000 and 150,000 local jobs (Table II-11).

The estimates of future population, housing units, local jobs, and square footage of development are not City policy. These assumptions are derived strictly for the purposes of analysis. The General Plan does not specify a maximum growth rate. Certain areas designated for urban use may or may not be developed between the present and 2035. Some areas may be developed at the upper end of the density ranges, while other areas may develop at the lower end. It is likely that, over time, the underlying factors driving these development forecasts will change. The City may update land use change assumptions from time to time, either in the context of a General Plan amendment or update, or as a separate exercise for planning purposes.

The City may also update the General Plan, Specific Plans, or implementing documents for policy purposes based, in part, on development forecasts and changes to these development forecasts in the future. For example, the Land Use Element contains policies that are intended to promote a beneficial jobs/housing balance. The right balance is related to the number of residents that commute, the transportation mode used for that commute, and the commute distance and time required. The relationship between jobs and housing affects and is affected by local employment opportunities, household incomes, housing prices, and non-residential lease rates and land costs. The City could

[2] This includes an assessment of the capacity for both "basic" and "non-basic" activities and services. While there is some overlap, in general, basic activities serve an export market, and are the driver of economic growth, while non-basic activities serve the local market.

consider plan amendments to the General Plan or Specific Plans to ensure an adequate supply of land for housing and economic development purposes.

Table II-11 | Existing and Future Development

Development Factor	2016	2035
Dwelling Units	52,900	75,200
Population	135,800	198,000
Non-Residential Square Footage	33,000,000	60,000,000
Jobs	82,000	120,000 to 150,000
Jobs to Dwelling Units	1.55	1.6 to 2

Notes: The population estimate assumes 2.1 persons per multi-family unit and 2.9 persons per single-family unit based on the American Community Survey (2013 - 2017), 1.8 persons per household for age-restricted dwelling units based on the 2010 Census, and 350 square feet for each resident for congregate care/assisted living facilities. The 2016 jobs estimate is from the Sacramento Area Council of Governments (SACOG) 2020 Metropolitan Transportation Plan/Sustainable Communities Strategy Appendix C – Land Use Forecast. The future non-residential square footage was estimated by the City of Roseville in 2019 and does not include square footage devoted to fairgrounds, schools, or structures within golf courses, parks, or cemeteries. The estimate for local jobs in 2035 is derived using existing jobs-to-housing, jobs-to-population, and employment per square footage ratios applied to 2035 estimates for dwelling units, population, and non-residential square footage.

Achieving the City's planning objectives requires more than the right ratio between housing and local jobs. This is not just a mathematical exercise, but rather, requires both a quantitative and qualitative analysis of commute behavior, employment opportunities by occupation and wage, housing need and income type, and the rate of both job and housing growth in a regional context. Similarly, while the relationship between jobs and housing is important to monitor, Roseville also strives to be a complete community with neighborhoods and districts that offer a diverse array of housing, commercial and public services, recreational and cultural opportunities, and multiple transportation options to reach daily destinations.

COMMUNITY FORM

The Community Form component is intended to go a step beyond the identification of land uses and the rules and regulations for their development. Goals and policies related to community form address the physical characteristics that lend shape, appearance, and identity to a community. A community's character is tied to expressions of familiar physical characteristics - landmarks, streets, buildings, parks, and natural features that create a unique identity. Roseville's policies are intended to influence the shape, form, and appearance of both new development and reinvestment in existing districts and neighborhoods, so that development appropriately reflects the vision and goals of residents and decision makers.

Community form has been the focus of regional long-range planning efforts, particularly since the adoption of the Sacramento Region Blueprint by the Sacramento Area Council of Governments (SACOG) Board of Directors in 2004. The Blueprint Principles focus on high-quality design for compact development that provides walkable communities; compact development that helps preserve open space, allow multi-modal transportation access, and facilitate more efficient infrastructure provision; reinvestment to allow better use of existing infrastructure; mixed-use development that provides for more vibrant neighborhoods; and open space that is incorporated into development and conserved on the fringes of the developed region for agriculture and habitat. These Blueprint Principles are broad and are expected to be applied differently in different parts of the Sacramento region. In 2005, the City went through a process to identify how these Principles, including the following Roseville Blueprint Implementation Strategies, which are embodied in the Community Form and Community Design components of this Element, should be applied locally.[3]

- **Transportation Choices:** Provide a variety of transportation choices. Development should be designed to encourage people to walk, ride bicycles, ride the bus, ride transit and heavy rail, or carpool. Land use concepts are intended to encourage the use of these modes of travel and reduce congestion.

- **Mixed Land Use:** Provide a variety of services in proximity to residential uses to reduce the reliance on automobile travel and give residents transit options… A mix of land uses can be provided within the same building and/or project. There are many examples of this type of development: housing near employment centers; a building with ground-floor retail with housing such as apartments or condominiums above; etc.

- **Compact Development:** Take advantage of compact building design. Creating environments that are more compactly built and that use space in an efficient but aesthetic manner can encourage more walking, biking, and public transit use, and shorten auto trips.

- **Housing Choices:** Create a range of housing opportunities and choices. Providing a variety of places where people can live such as apartments, condominiums, townhouses, and single-family detached homes on varying lot sizes is important in serving all aspects of the community including families, singles, seniors, and people with special needs. This issue is of special concern for residents with very low-, low-, and moderate-incomes (often our teachers, entry-level public safety personnel, and other public employees and professionals) as well as retail employees, service workers, and others for whom finding housing close to work is challenging, especially as land values increase. By providing a mix of housing options, residents will have more choices.

- **Use Existing Assets:** Use of existing assets to strengthen and direct development toward existing development areas. Ongoing public and private investment in the Downtown and historic core is critical to maintaining and enhancing the economic vitality of Roseville. Development of infill or vacant lands, intensification of underutilized parcels, or redevelopment can make better use of existing public

[3] Please see *Smart Choices for Roseville's Future: Implementation Strategies to Achieve Blueprint Project Objectives* (May 2005) for more details.

infrastructure. This can include rehabilitation and reuse of buildings, introduction of mixed-use opportunities, and joint use of existing public facilities, such as parking garages.

- **Natural Resource Conservation:** Natural resource conservation of open space and agricultural land. Encourage the incorporation of public-use open space (such as parks, town squares, trails, greenbelts, paseos, and preserves) within development projects and protect wildlife and plant habitat through open space preservation, agricultural preservation, and promotion of environment-friendly practices, such as energy efficient design, water conservation, and stormwater management. In addition to conserving resources and protecting species, natural resource conservation improves the overall quality of life by providing places for everyone to enjoy the outdoors with family outings and by creating a sense of open space throughout the community.

- **Quality Design:** Foster distinctive, attractive communities with a strong sense of place and use land efficiently. The design details of any land use development, such as the relationship to the street, setbacks, placement of garages, sidewalks, landscaping, the aesthetics of building design, and the design of the public right-of-way (sidewalks, connected streets and paths, bike lanes, and the width of streets), are all factors that can influence the attractiveness of living in a compact development. Design also facilitates the ease of walking and biking to work or neighborhood services. Good site and architectural design are important factors in creating a sense of community and a sense of place.

The Community Form component addresses the following topics:

- ***General*** policies that identify the desired quality of design and public services, along with the connectedness of all neighborhoods and commercial districts of the City.

- ***Development Patterns, Transportation, and Air Quality/Greenhouse Gas Emissions*** provide guidance for land use patterns that allow residents a range of viable transportation options, including walking, bicycling, transit, and vehicular travel.

- ***Downtown and Neighborhoods*** indicates the City's priority in retaining, enhancing, and preserving its historic business district and existing neighborhoods and the development of new areas that provide neighborhood services.

- ***Relationship of New Development*** emphasizes the importance of ensuring that the forms of new development cohere with those of the existing community, and that all portions of the City are linked and compatible with one another.

- ***Jobs/Housing and Economic Development*** establishes policies that support the fiscal viability of the City, focusing on jobs and housing for residents and a prosperous business climate.

- ***Community Involvement and Inter-jurisdictional Cooperation*** addresses the need for community and regional involvement on major development applications, City studies, and regional issues such as air quality, solid waste and transportation. Community involvement will be broad and inclusive and continue to engage the Roseville Coalition of Neighborhood Associations.

GOALS AND POLICIES

COMMUNITY FORM: GENERAL

Goal LU1 **Define Roseville's overall identity and character by the following attributes:**

a. Distinction from other communities through the quality of development and the high level of services provided to citizens.

b. **A commitment to preserving its small-town attributes and cultural heritage and a dedication to promoting a strong sense of community, while preserving individual neighborhoods and promoting a prosperous business community.**

c. **Continuing to be a family-oriented community that offers opportunities to pursue various lifestyles.**

d. **Residential development that includes clusters of high to low densities balanced with large expanses of open space.**

e. **Ensuring high standards of public safety.**

Policy LU1.1 *Ensure high-quality development in new and existing development areas, as defined through specific plans, the development review process, and the Community Design Guidelines.*

Policy LU1.2 *Through both public and private efforts, develop clearly defined entries at major entrances into the City through the use of open space, landscaping, signage, and other distinctive elements as a way of defining the City's boundaries and identity.*

Policy LU1.3 *Continue to provide a full range of public services and maintain high levels of service for public facilities, services, transportation, open space, and parks and recreation.*

Policy LU1.4 *Promote a diversity of residential living options (e.g. density ranges, housing types, affordability ranges), while ensuring community compatibility and well-designed residential development.*

Policy LU1.5 *Promote land use patterns that result in the efficient use of urban lands and preservation of open space, as specified in the Open Space and Conservation Element.*

Policy LU1.6 *Through development approvals and City programs (e.g., revitalization, Capital Improvement Program, parks and recreation programs, etc.), ensure that all portions of the community are linked and integrated.*

Policy LU1.7 *Promote land use patterns that result in the dispersion of secondary or satellite services including libraries, schools, parks, public meeting places, and commercial uses throughout the community through the establishment of neighborhood centers.*

COMMUNITY FORM: DEVELOPMENT PATTERNS, TRANSPORTATION, AND AIR QUALITY/GREENHOUSE GAS EMISSIONS

Goal LU2 **Achieve a community form that supports convenient and safe pedestrian, bicycle, and transit access.**

Policy LU2.1 *Promote development patterns that support a variety of transportation modes and accommodate pedestrian mobility.*

Policy LU2.2 *Allow mixed-use development that integrates residential and non-residential land uses, so that residents may easily walk or bike to shopping, services, employment, and leisure activities.*

Policy LU2.3 *Concentrate higher-intensity uses and appropriate support uses in Pedestrian Districts and within close proximity of transit and bikeway corridors, as identified in the Transit Master Plans and Bicycle Master Plan. Public uses, such as parks, plazas, public buildings, community centers, schools, and/or libraries, should be easily accessible to the public.*

Policy LU2.4 *Promote and encourage the location of employee services, such as child care, restaurants, banking facilities, convenience markets, and other daily needs within major employment centers for the purpose of reducing mid-day vehicle trips.*

Policy LU2.5 *Where feasible, improve existing developed areas to create better pedestrian, bicycle, and transit accessibility.*

Policy LU2.6 *Require proposed neighborhood-serving uses (e.g. neighborhood commercial uses, day care, parks, schools, and other community facilities and services) to be physically linked with adjacent residential neighborhoods through multi-modal transportation connections.*

COMMUNITY FORM: DOWNTOWN AND REVITALIZATION

Goal LU3.1 In partnership with private interests, the City of Roseville will continue to promote a vibrant town center offering government services, social and cultural activities, and commercial opportunities in Downtown Roseville. Roseville will also encourage the creation of additional social, cultural and commercial satellite opportunities throughout the community.

Goal LU3.2 Through the designation of special study areas and revitalization efforts, the City of Roseville will preserve, revitalize, and enhance its business districts, existing neighborhoods, and mixed-use corridors.

Policy LU3.1 *Create and maintain a strong and identifiable Downtown that offers the surrounding community a cluster of municipal offices and services, commercial, retail, and office uses, higher education opportunities, and higher-density residential uses, consistent with the Downtown Specific Plan.*

Policy LU3.2 *Facilitate population and economic growth in areas having the potential for revitalization*

Policy LU3.3 *Direct resources to facilitate revitalization of Downtown, neighborhoods in the Infill Area, and mixed-use corridors.*

Policy LU3.4 *Encourage infill development and reinvestment that:*

- *Upgrades the quality and enhances the character of existing areas;*
- *Enhances the mix of land uses in proximity to one another so that more households can access services, recreation, and jobs without the use of a car;*
- *Facilitates pedestrian activity and public transit use;*
- *Efficiently utilizes and does not overburden existing services and infrastructure; and*

- *Results in land use patterns and densities that provide the opportunity for the construction of a variety of housing types that are affordable to all income groups.*

Policy LU3.5 *Promote active citizen involvement in defining, maintaining, and improving the character and identity of existing neighborhoods, including consideration of cultural and artistic enhancements.*

Policy LU3.6 *Support the maintenance and rehabilitation of existing residential units within established neighborhoods.*

Policy LU3.7 *Identify locations where special study is necessary to develop strategies for preserving, enhancing, and revitalizing existing developed areas.*

COMMUNITY FORM: NEW DEVELOPMENT

Goal LU4 Design new development to be integrated, connected, and related to existing development areas within the City.

Policy LU4.1 *Require new development areas and associated community-wide facilities (open space resources, parks, libraries, etc.) to be linked and oriented to existing developed areas of the community through road networks, public transit systems, open space systems, bikeway and pedestrian systems, and other physical connections.*

Policy LU4.2 *Encourage a development pattern that is contiguous with existing developed areas of the City.*

COMMUNITY FORM: JOBS/HOUSING AND ECONOMIC DEVELOPMENT

Goal LU5.1 Roseville will strive to be a complete community with a mix of land uses, housing types, and job opportunities that meet the diverse needs of its existing and future residents and businesses.

Goal LU5.2 Roseville will promote and encourage the availability of a variety of goods and services and retain a positive business climate in the City.

Policy LU5.1 *Implement a land use mix and pattern of development that provides linkages between residents' jobs and local employment-generating uses, facilitates a match between the number and type of local jobs and the local labor force, and maintains the fiscal viability of the City.*

Policy LU5.2 *Support density bonuses in the construction of affordable housing, in accordance with the Density Bonus Ordinance and the Housing Element, to promote affordable housing options in areas particularly in areas where with few such housing opportunities and where employment centers exist or are planned.*

Policy LU5.3 *Consider the fiscal impacts to the City from projects proposing a General Plan land use change.*

Policy LU5.4 *The City may approve a project that is identified as having a negative fiscal impact on the City if overriding findings are made that the project benefits outweigh its impacts. Such benefits may relate to the provision of affordable housing, significant open space or recreation facilities, job creation, infill development near transit service, or other public benefits.*

Policy LU5.5 *Uphold the City's Affordable Housing Goal by requiring an affordable housing target for projects seeking a General Plan Amendment, Specific Plan Amendment, and/or rezoning to a residential designation proposing 25 or more new dwelling units. For these projects, the target is for a minimum of 10% of all new housing units to cost no more than 30% of the total monthly income of very low-, low-income, and moderate-income households (the City also uses the term "middle" in certain Specific Plans to refer to moderate-income households earning no more than 100% of the Area Median Income- AMI). The breakdown of the affordable units will be, at a minimum, 40% for rental to very low- and 40% for rental to low-income households. The remaining 20% may be reserved for moderate-income purchase (which will be priced to be affordable to households earning 95% of the Area Median Income) or may be distributed equally among the rental obligations, as approved by the City. Variations in affordable housing ratios may be approved through a Development Agreement where the following criteria are met:*

- *A need has been identified for a specific affordable housing type (very low-, low- or moderate-income) and the project meets this need;*
- *The project does not rely on or obtain City subsidies; and*
- *Units proposed within these criteria would allow for individuals to stay within their units as their future income grows.*

Policy LU5.6 *Maintain land use patterns, intensities, and densities that ensure an adequate supply of land for office, commercial, industrial, and other employment-generating development.*

Policy LU5.7 *Support activities that attract employment uses to the City, as identified in the Economic Development Strategy.*

COMMUNITY FORM: COMMUNITY INVOLVEMENT AND INTER-JURISDICTIONAL COOPERATION

Goal LU6.1 Roseville recognizes its role within the Sacramento and Placer County region and is dedicated to exploring regional solutions to regional issues.

Goal LU6.2 Provide inclusive community engagement opportunities for individuals and community groups to produce timely and meaningful input leading to proactive, consensus-driven actions by the City and its partners.

Policy LU6.1 *Encourage active involvement by individuals and citizens in the planning process through ongoing public participation opportunities and informational programs.*

Policy LU6.2 *For major development proposals (e.g. major General Plan amendments, adoption of specific plans and amendments), encourage and provide public participation opportunities at early stages in the process.*

Policy LU6.3 *Coordinate and take a lead role, where feasible, with local, state, federal, and other agencies on regional issues of importance, including but not limited to air quality, climate change mitigation and resiliency, transportation, water supply, sewage treatment, solid waste disposal and recycling, flood control, hazardous waste management, resource protection, and transit.*

Policy LU6.4 *To the extent feasible, coordinate land use planning and public improvements with neighboring jurisdictions.*

Policy LU6.5 *Encourage early consultation with adjacent jurisdictions and refer development proposals that may have an impact to these jurisdictions to the respective agencies for their review and comment. Respond and comment on development proposals in other jurisdictions that may have an impact on Roseville to minimize such impacts and ensure consistency and compatibility with existing and planned development in the City.*

COMMUNITY DESIGN

Design influences the aesthetics, character, desirability, and function of a community. Roseville, through its development review process, promotes high-quality design that balances aesthetic and functional considerations; integrates the natural and built environments; and creates inviting, convenient, safe, and comfortable human-scale connections between different land uses.

The emphasis of the Community Design component of this Element is on presenting a design framework that reflects the City's goal of high-quality, community-wide design. To assist in achieving this goal, the City has developed policies that address aesthetics and function, the integration of the built and the natural environments, art in public places, and community character. The application of these design principles will help to establish an aesthetically pleasing city and a distinct community identity.

The goals and policies in this Element will be implemented through the application of the City's Community Design Guidelines. The Guidelines provide detailed standards that establish common design elements and concepts to be used in the design and review of new development proposals in Roseville. The intent of the Guidelines is to ensure consistent quality, while supporting flexibility and the ability to provide unique solutions that fulfill the intent of the Guidelines through alternative means. The City anticipates that the Community Design Guidelines will need to be updated periodically to implement the General Plan's direction in a dynamic regulatory and economic environment. The design concepts contained in this Element, and further refined by the Community Design Guidelines, indicate Roseville's desire to create a City that has a distinct character notable for its high-quality design.

GOALS AND POLICIES

COMMUNITY DESIGN

Goal LU7.1 **Achieve a consistent level of high-quality aesthetic and functional design through the development of, and adherence to superior design concepts and principles, as defined in the Community Design Guidelines.**

Goal LU7.2 **Encourage, promote, and support the maintenance and expansion of a wide range of programs that serve to increase public understanding, appreciation, and enjoyment of cultural and artistic forms, and the display of artistic expression in public spaces to contribute to the cultural experience and the sense of place and community.**

Goal LU7.3 **Encourage the planning and building of a city that sensitively integrates open space and natural resources, and promotes compatibility within and between the natural and the urban environments.**

Goal LU7.4 Emphasize the preservation and enhancement of historically and culturally significant buildings, native oak trees, woodlands, and other significant features, as a primary element in defining Roseville's community character.

Policy LU7.1 *Through the design review process, apply design standards that promote the use of high-quality building materials, architectural and site designs, landscaping signage, and amenities.*

Policy LU7.2 *Continue to develop and apply design standards that result in efficient site and building designs, pedestrian-friendly projects that stimulate the use of alternative modes of transportation, and compatibility between adjacent developments.*

Policy LU7.3 *Encourage designs that strike a balance between the incorporation of aesthetic and development requirements, and the economic considerations associated with development.*

Policy LU7.4 *Promote flexibility in the design review process to achieve design objectives, and encourage projects with innovative, unique, and creative architectural style and design.*

Policy LU7.5 *Encourage, promote, and support art in public spaces and programs to enhance the design of the City.*

Policy LU7.6 *Encourage project designs that place a high priority and value on open space, and the preservation, enhancement and incorporation of natural resources and other features including consideration of topography, vegetation, wetlands, and water courses.*

Policy LU7.7 *Encourage and promote the preservation of historic and/or unique, culturally and architecturally significant buildings, features, and important visual resources.*

Policy LU7.8. *The location and preservation of native oak trees and oak woodlands shall be a primary factor in determining site design, building location, grading, construction and landscaping, and in establishing the character of projects through their use as a unifying element in both new and existing development.*

Policy LU7.9 *Control artificial lighting to avoid spill-over lighting onto adjacent properties. Use anti-reflective architectural materials and coatings to prevent glare.*

GROWTH MANAGEMENT

In general, growth management can be defined as certain actions taken by local government to influence the location, composition, rate, or total amount of development in a community. The City manages growth to help coordinate development opportunities and constraints, as dictated by the physical, social, and economic characteristics of the areas planned for development, for the City as a whole.

The City recognizes two primary candidates for growth potential. The first is within existing developed parts of the City's corporate boundaries through reinvestment in the community. The second is either inside or outside City limits through new development of "greenfield" areas (non-urbanized or vacant land). "Greenfield" development has been the focus of the City's growth management efforts, but as the City matures and approaches buildout, infill development and reinvestment have an increasing role in meeting the City's needs for housing and economic development.

Inherent in the term "growth management" is the assumption that there will be growth. With growth, there are many potential tangible and intangible benefits, as well as impacts. The right type of growth can be beneficial to the community's economy and quality of life through additional employment opportunities, housing availability, improved delivery and variety of services, opportunity for greater access to destinations without the use of a car, enhanced efficiency of public service provision and fiscal sustainability, and increased commercial, social and cultural opportunities. At the same time, if growth is not well planned and managed, it can have negative impacts on the community. These may include increased reliance on the automobile for reaching destinations, public health effects related to air pollutant emissions, increased costs of construction and maintenance for public infrastructure, impacts to environmental resources, loss of community character, loss of the sense of safety and security, and other adverse effects.

Growth Management Principles

The challenge is to accommodate and manage growth that balances the positive and negative impacts in a fashion that results in an overall benefit to the community. This is best accomplished proactively. To this end, the overarching principles that guide the City's approach to managing growth include:

- Maintain quality of life through a balance of land uses;
- Maintain the City's fiscal health in the long term;
- Continue to add and enhance the value of the built environment;
- Maintain and further define the City's physical form through creation of an open space transition area along the western interface with County lands.

In the recent past, the City has used the Specific Plan process, with appropriate updates to the General Plan, to manage and direct growth in a way that is relatively more comprehensive, compared to a project-by-project approach. This approach allows the City to plan for and finance necessary infrastructure and facilities, address area-wide development opportunities and constraints, and identify key growth management issues that may not be apparent in the context of individual project analysis.

Growth Management Visioning Committee

In 2004, the City Council appointed a 20-member Growth Management Visioning Committee. The Committee was charged with reviewing growth management policies and developing a vision and policy recommendations to guide the City's long-range physical development. The Committee's Vision includes 11 characteristics that define the preferred future:

- A Distinct Community Identity;
- Well-Planned Neighborhoods and Communities;
- A Vibrant Downtown;
- A Balance Between New Growth and Revitalization;
- Abundant Parks and Open Space;
- A Diverse Range of Housing Types;
- Mobility and Transportation Choices;
- Economic Vitality;
- Convenient Access to Higher Education;
- Sustainable Environmental Resources and Infrastructure;
- Innovative Design and Land Use Planning; and,
- On-going Partnerships with Neighboring Communities.

The Committee recommended three additional policy concepts: Maintain Roseville's Identity and Character; Promote Stakeholder Involvement and Ensure Accountability; and Work Aggressively to Address Traffic Generated Outside of Roseville. Further, the Committee recommended that the following Policy Concepts be used to evaluate and influence potential growth that could affect the City within its current boundaries, within its Sphere of Influence, and in unincorporated land where the development will impact the City:

- Maintain an Open Space Transition Buffer;
- Ensure Fiscal Sustainability;
- Encourage High-Quality Infrastructure, Programs, and Services;
- Promote Comprehensive Large-Scale Planning;
- Use Performance-Based Standards to Manage Growth;
- Ensure Community Benefit;
- Maintain Roseville's Identify and Character;
- Promote Stakeholder Involvement and Ensure Accountability; and,
- Work Aggressively to Address Traffic Impacts Generated Outside of Roseville.

Guiding Principles for Growth

The City Council adopted a set of 13 Guiding Principles for new development areas in May of 2001. The intent of the Guiding Principles is to supplement General Plan policies by creating guidelines for new development proposals for areas located outside of City limits. They are intended to articulate the City's expectations relating to any potential development proposals and are to be applied as performance

measures for annexation proposals. These principles are contained as policies of this Growth Management component.

The Growth Management component focuses on the development of performance standards rather than artificial timelines or growth rates for future development. This approach has resulted in goals and policies that emphasize performance (e.g., maintaining levels of service, providing adequate park acreage, financing needed school facilities, etc.) rather than on specific dates, growth rates, or build-out of existing plans. The performance standards provide the criteria for planning and managing growth by requiring the mitigation of growth impacts and the provision of both tangible and intangible benefits to the community.

GOALS AND POLICIES

GROWTH MANAGEMENT - GENERAL

Goal LU8.1 **Proactively manage and plan for growth.**

Goal LU8.2 **Encourage a pattern of development that promotes the efficient and timely provision of urban infrastructure and services, and that preserves valuable natural and environmental resources.**

Goal LU8.3 **Growth shall mitigate its impacts through consistency with the General Plan goals and policies and shall provide a positive benefit to the community.**

Goal LU8.4 **Continue a comprehensive, logical planning process, rather than an incremental, piecemeal approach.**

Goal LU8.5 **Encourage public participation in the development and monitoring of growth management policies and programs.**

Goal LU8.6 **Manage and evaluate growth in a regional context, not in isolation.**

Goal LU8.7 **Potential population growth in Roseville must be based on the long-term carrying capacities and limits of the roadway system, sewer and water treatment facilities, and electrical utility service, as defined in the Circulation Element and the Public Facilities Element.**

Goal LU8.8 **Growth and development must occur at a rate corresponding to the availability of desired facilities' capacity.**

Goal LU8.9 **Growth should be managed to minimize negative impacts to existing businesses and residents within the City.**

Goal LU8.12 **Use growth management as a tool to maintain the City's identity, community form, reputation in the region, to maintain high levels of service for residents, and to influence projects outside the City's boundaries that have the potential to affect the quality of life and/or services that are provided to residents.**

Policy LU8.1 *Growth must provide a strong diversified economic base and a balance between employment and affordable housing.*

Policy LU8.2 *Growth should occur on the basis that projected revenue should be sufficient to meet public costs.*

Policy LU8.3 *Growth shall be managed to ensure that adequate public facilities and services, as defined in the Public Facilities Element, are planned and provided, and public health, safety, and welfare is protected.*

Policy LU8.4 *The City shall accommodate projected population and employment growth in areas where the appropriate level of public infrastructure and services are planned or will be made available concurrent with development.*

Policy LU8.5 *The City shall use the specific plan process to ensure a comprehensive, logical growth process for new development areas (e.g., annexations) or any areas where significant land use changes are considered.*

Policy LU8.6 *The City shall oppose urban density residential, commercial, or industrial development in unincorporated areas unless adequate public facilities and services can be provided and mechanisms to ensure their availability and provision are secured during the land use entitlement process. It is the City's preference that urban development occur within incorporated areas.*

Policy LU8.7 *The City will manage growth in such a way to ensure that significant open space areas will be preserved.*

Policy LU8.8 *Retain and enhance Roseville's identity and character to ensure that Roseville, even as it grows, remains consistent with the Growth Management Visioning Committee's Vision Statement.*

Policy LU8.9 *Work aggressively to address traffic generated outside of Roseville by working in collaboration with neighboring jurisdictions, regional, state, and federal entities to ensure that traffic through Roseville is mitigated by regional solutions. The City will encourage changes in land use mix and community design that promote walking, biking, and transit.*

Policy LU8.10 *In addition to being consistent with the other goals and policies of the General Plan, Specific Plans shall comply with the following:*

a. *Provide a public focal point, community, and/or theme feature. These features shall be specific to each area and be designed to promote and enhance community character. A special feature may include, but is not limited to, a community plaza, central park, or some other type of gathering area; outdoor amphitheater; community garden; regional park with special facilities; sports complex; or cultural facilities.*

b. *Provide entryways at entrances to the City in accordance with the Community Design Guidelines. Where possible, the entryways shall take advantage of and incorporate existing natural resources into the entry treatment. The Specific Plans shall identify the location and treatment of the entryways, and shall consider the use of open space, oak regeneration areas, signage, and/or special landscaping to create a visual edge or buffer that provides a strong definition to entryways into the City.*

c. *The Specific Plan areas shall be planned and oriented to be an integral part of the City consistent with the policies of the Community Form component of this Element.*

d. *Develop design guidelines, specifying screening and a transition between public utilities (e.g. substations, pump stations) and other uses, in conjunction with the public utility departments and agencies. In addition, development along power line and*

pipeline easements shall incorporate design treatment to ensure compatibility and safety. Design guidelines and treatment may include minimum setbacks, building and landscape design standards, and possible limitations on certain types of uses and activities.

e. *Preserve natural resource areas where they exist, and where feasible, along new roadways. Such roadways may create a public boundary between the resource area and other uses. The Specific Plans shall identify locations and standards for the preservation of natural resources along roadways, and shall identify sources of financing for such road segments.*

GROWTH MANAGEMENT – NEW GROWTH AREAS

Goal LU9.10 Growth should be planned in a way that addresses the appropriate interface between City and County lands.

Goal LU9.11 New growth should be designed to meet the Guiding Principles for Growth.

Goal LU9.13 New development shall be consistent with the City's desire to establish an edge along the western boundary of the City that fosters: a physical separation from County lands through a system of connected open space; a well-defined sense of entry to City from the west; opportunities for habitat preservation and recreation; and view preservation corridors that provide an aesthetic and recreational resource for residents.

Policy LU9.1 *The City may consider modification to the General Plan for new growth where adequate public services and facilities and preservation and conservation of natural resources can be provided in conjunction with the following:*

a. *Additional land to accommodate demand for housing or employment uses*

b. *Projects that will provide community benefits, including, but not limited to the provision of public transit services*

c. *Ensure that growth provides benefits to the community as a whole and weigh community benefits against public costs*

Policy LU9.2 *Prior to the consideration of any General Plan amendment to modify land use designations or expand the City's boundaries or Sphere of Influence, the City shall complete or cause to be completed the following City-wide studies/plans:*

a. *Long-range transit plan*

b. *Fiscal studies*

c. *Public facilities and services capacity study*

d. *Transportation system capacity study*

e. *Utility capacity and supply (i.e., water, sewer, drainage, and electric)*

The studies shall define overall holding capacities and identify additional performance standards that will need to be met to ensure the achievement of the goals and policies of the General Plan.

Policy LU9.3 *The City shall require the submittal of a specific plan for the consideration of new development areas or any areas where a significant modification to the General Plan land use allocation is proposed. The specific plan process shall, at a minimum, include the following:*

a. *General Plan Amendment*

b. *Development Agreement*

c. *Zoning Entitlements*

d. *Environmental Impact Report*

e. *Phasing, Financing, Capital Improvements Plan*

f. *Fiscal Impact Analysis*

Policy LU9.4 *Specific plans will be evaluated based on the following minimum criteria:*

a. *Government Code requirements for specific plans*

b. *Demonstrated consistency with General Plan goals and policies*

c. *Demonstrated consistency with the identified City-wide studies and holding capacity analyses*

d. *Justification for proposed specific plan boundaries*

e. *Community benefit (e.g., affordable housing, significant open space or recreation facilities, job creation, infill development near transit service).*

f. *Ability to substantially mitigate impacts*

g. *Impact on the City's growth pattern*

Each specific plan proposal shall include, with its initial submittal, a full analysis of how the plan complies with, and relates to the above factors.

Policy LU9.5 *Apply the City's adopted Guiding Principles for Growth to any new development proposed in and out of City's corporate boundaries that is not already part of an adopted Specific Plan or within the Infill Area:*

1. *Any new development proposal shall, on a stand-alone basis, have an overall net neutral or positive fiscal impact on the City's General Fund Services.*

2. *Any new development proposal shall include logical growth/plan boundaries.*

3. *Any new development proposal shall not create a direct or indirect conflict with the ongoing operations of the Pleasant Grove or Dry Creek Wastewater Treatment Plant operations or any City-owned power generation facilities.*

4. *Any new development proposal shall maintain the integrity of existing neighborhoods and create a sense of place in new neighborhoods.*

5. *Any new development proposal shall include a plan to ensure full funding and maintenance of improvements and services at no cost to existing residents (including increased utility rates). A proposal shall not burden, increase the cost of, or diminish the supply or reliability of public services.*

6. *Any new development proposal shall aid in regional transportation solutions and in right-of-way preservation.*

7. *Any new development proposal that does not have a sufficient supply of surface water shall secure additional supplies above what the City currently has available. New development proposals shall also provide the funding necessary to incorporate the new source of supply into the City's water supply portfolio (surface water, groundwater and recycled water); and new development proposals shall include measures to reduce water demand by implementing the use of conservation best management practices, recycled water, and other off-sets.*

8. *Any new development proposal shall consider development potential within the entire City/County Memorandum of Understanding Area in the design and sizing of infrastructure improvements.*

9. *Any new development proposal shall aid in resolution of regional storm water retention.*

10. *Any new development proposal shall incorporate mechanisms to ensure schools, and, if necessary, new schools, are available to serve residents anticipated for new development and that new development does not adversely affect existing schools.*

11. *Any new development proposal shall include a significant interconnected public open space component/conservation plan consistent with the City of Roseville/U.S. Fish and Wildlife Service Memorandum of Understanding.*

12. *Any new development proposal shall include a public participation component to keep the public informed and solicit feedback throughout the specific plan process.*

13. *Any new development proposal shall provide a community benefit to the City and residents.*

Policy LU9.6 *As new development is proposed in or outside the City's Sphere of Influence, project proponents shall provide a transitional area between City and County lands, through a system of managed interconnecting open space or other buffers, such as separation by arterial roadways.*

Policy LU9.7 *Monitor and participate in development proposals and/or General Plan updates in Placer County to ensure that potential impacts to City residents are minimized, with respect to traffic, service levels, and other quality of life matters.*

Policy LU9.8 *New development proposals to the north and west of the City limits shall meet the objectives and terms of the Memorandum of Understanding between the City of Roseville and the County of Placer.*

Policy LU9.9 *Development proposed on the western edge of the City shall provide a distinctive open space transition to create a physical and visual buffer between the City and County that ensures that the identity and uniqueness of the City and County will be maintained.*

Policy LU9.10 *Consistent with the County/City Memorandum of Understanding, the City shall continue to support and endorse the maintenance of the one-mile buffer zone around landfill operations, as set forth in Policy No. 4.G.11 of the Placer County General Plan. The buffer zone should, consistent with relevant performance criteria, be sufficient to maintain the long-term viability of the landfill, while at the same time protecting City residences from nuisances.*

Policy LU9.11 *Promote stakeholder involvement and ensure accountability between property owners, Placer County, and surrounding jurisdictions on defining and shaping the vision for growth to the west and north of the City.*

GROWTH MANAGEMENT - ANNEXATIONS AND SPHERE OF INFLUENCE

Goal LU10 Evaluate Sphere of Influence amendments and annexations that promote efficient use of land and public service provision and advance General Plan goals.

Policy LU10.1 *The City may initiate studies to investigate the potential of (1) annexing areas within its Sphere of Influence; and (2) expanding its Sphere of Influence boundaries. The studies should be focused on those areas that may affect General Plan goals and policies and would be logically served and planned by the City. The studies shall include the identification, availability, and funding of public services, as well as the costs and impacts to the City and other service providers. Issues to be analyzed include, but are not limited to present and planned land uses, water, sewer, electric, library, parks, schools, circulation, and affordable housing. Based on these studies and resident and property owner input, the City may take steps to annex or expand its Sphere of Influence.*

Policy LU10.2 *The City may consider annexations that:*

- *Are contiguous with City boundaries and provide for a logical expansion of the City;*
- *Create clear and reasonable boundaries;*
- *Are beneficial from a fiscal standpoint to the City and its residents;*
- *Are consistent with state law and Placer County Local Agency Formation Commission (LAFCO) standards and criteria;*
- *Ensure the preservation of open space and agriculture lands; and,*
- *Are consistent with the General Plan.*

Policy LU10.3 *The City may consider expanding its Sphere of Influence to incorporate areas that, in the future, should be logically planned and serviced by Roseville. The City shall consider the following factors, as identified by LAFCO, when making determinations involving Sphere of Influence boundaries:*

- *Present and planned land uses in the area;*
- *Present and probable need for public facilities and services in the area;*
- *Present capacity of public facilities and adequacy of public services;*
- *Existence of any social or economic communities of interest in the area; and,*
- *Open space and agricultural lands.*

Water Audit Report for: City of Roseville (3110008)
Reporting Year: 2019 1/2019 - 12/2019

Please enter data in the white cells below. Where available, metered values should be used; if metered values are unavailable please estimate a value. Indicate your confidence in the accuracy of the input data by grading each component (n/a or 1-10) using the drop-down list to the left of the input cell. Hover the mouse over the cell to obtain a description of the grades

All volumes to be entered as: ACRE-FEET PER YEAR

To select the correct data grading for each input, determine the highest grade where the utility meets or exceeds all criteria for that grade and all grades below it.

Master Meter and Supply Error Adjustments

WATER SUPPLIED

<---------- Enter grading in column 'E' and 'J' ---------->

					Pcnt:	Value:	
Volume from own sources:	7	28,372.970	acre-ft/yr	7		3.744	acre-ft/yr
Water imported:	5	1,264.500	acre-ft/yr	2			acre-ft/yr
Water exported:	3	1,336.300	acre-ft/yr	1			acre-ft/yr

Enter negative % or value for under-registration
Enter positive % or value for over-registration

WATER SUPPLIED: 28,297.426 acre-ft/yr

AUTHORIZED CONSUMPTION

Click here: ? for help using option buttons below

				Pcnt:	Value:	
Billed metered:	6	26,276.770	acre-ft/yr			
Billed unmetered:	10	132.020	acre-ft/yr			
Unbilled metered:	8	0.080	acre-ft/yr			
Unbilled unmetered:	8	23.320	acre-ft/yr		23.320	acre-ft/yr

Use buttons to select percentage of water supplied OR value

AUTHORIZED CONSUMPTION: ? 26,432.190 acre-ft/yr

WATER LOSSES (Water Supplied - Authorized Consumption) 1,865.236 acre-ft/yr

Apparent Losses

				Pcnt:	Value:	
Unauthorized consumption:		70.744	acre-ft/yr	0.25%		acre-ft/yr

Default option selected for unauthorized consumption - a grading of 5 is applied but not displayed

Customer metering inaccuracies:	4	265.423	acre-ft/yr	1.00%		acre-ft/yr
Systematic data handling errors:	5	65.692	acre-ft/yr	0.25%		acre-ft/yr

Default option selected for Systematic data handling errors - a grading of 5 is applied but not displayed

Apparent Losses: ? 401.858 acre-ft/yr

Real Losses (Current Annual Real Losses or CARL)

Real Losses = Water Losses - Apparent Losses: ? 1,463.378 acre-ft/yr

WATER LOSSES: 1,865.236 acre-ft/yr

NON-REVENUE WATER

NON-REVENUE WATER: ? 1,888.636 acre-ft/yr

= Water Losses + Unbilled Metered + Unbilled Unmetered

SYSTEM DATA

Length of mains:	9	633.4	miles
Number of active AND inactive service connections:	9	45,395	
Service connection density:		72	conn./mile main

Are customer meters typically located at the curbstop or property line? Yes

Average length of customer service line: (length of service line, beyond the property boundary, that is the responsibility of the utility)

Average length of customer service line has been set to zero and a data grading score of 10 has been applied

Average operating pressure:	6	83.2	psi

COST DATA

Total annual cost of operating water system:	10	$14,408,821	$/Year	
Customer retail unit cost (applied to Apparent Losses):	9	$1.30	$/100 cubic feet (ccf)	
Variable production cost (applied to Real Losses):	5	$208.00	$/acre-ft	☐ Use Customer Retail Unit Cost to value real losses

WATER AUDIT DATA VALIDITY SCORE:

***** YOUR SCORE IS: 70 out of 100 *****

A weighted scale for the components of consumption and water loss is included in the calculation of the Water Audit Data Validity Score

PRIORITY AREAS FOR ATTENTION:

Based on the information provided, audit accuracy can be improved by addressing the following components:

1: Volume from own sources
2: Customer metering inaccuracies
3: Billed metered

Appendix E – Proposed Water Loss Standards

Proposed Water Loss Performance Standards

Note: The State Water Board has proposed combined standards for water districts that generally report per other water use efficiency requirements in a combined manner for certain water systems.

Sample combination of standards for water systems reporting in different metrics:

Suppliers with all water systems reporting in gallons per connection per day: Standard in in gallons per connection per day

$$\frac{\text{Standard for system 1} \times \text{Number of connections for system 1} + \text{Standard for system 2} \times \text{Number of connections for system 2}}{\text{Sum total of number of connections for system 1 and system 2}}$$

Suppliers with all water systems reporting in gallons per mile per day: Standard in gallons per mile per day

$$\frac{\text{Standard for system 1} \times \text{Length of mains for system 1} + \text{Standard for system 2} \times \text{Length of mains for system 2}}{\text{Sum total of length of mains for system 1 and system 2}}$$

Suppliers with water systems reporting in a combination of gallons per mile per day and gallons per connection per day:

Standard in gallons per connection per day

$$\frac{\text{Standard for system 1} \times \text{Number of connections for system 1} + \text{Standard for system 2} \times \text{Length of mains for system 2}}{\text{Sum total of number of connections for system 1 and system 2}}$$

Calculated baseline and proposed water loss performance standards

Note: The standards that are combined for certain water districts are in orange text, while the individual system data informing the respective combined standard is in *italics* and grey text in the rows above the standard.

Urban water supplier (naming per water loss audit)	Baseline water loss (Averaged over 2017-2019) Gallons per connection per day	Baseline water loss (Averaged over 2017-2019) Gallons per mile per day	Water loss performance standards Gallons per connection per day	Water loss performance standards Gallons per mile per day

Appendix F – 2015 SBX7-7 Verification Form

SB X7-7 Table 0: Units of Measure Used in UWMP* *(select one from the drop down list)*
Acre Feet
**The unit of measure must be consistent with Table 2-3*
NOTES:

SB X7-7 Table-1: Baseline Period Ranges

Baseline	Parameter	Value	Units
10- to 15-year baseline period	2008 total water deliveries	34,052	Acre Feet
	2008 total volume of delivered recycled water	2,985	Acre Feet
	2008 recycled water as a percent of total deliveries	8.77%	Percent
	Number of years in baseline period[1,2]	10	Years
	Year beginning baseline period range	1995	
	Year ending baseline period range[3]	2004	
5-year baseline period	Number of years in baseline period	5	Years
	Year beginning baseline period range	2003	
	Year ending baseline period range[4]	2007	

[1] If the 2008 recycled water percent is less than 10 percent, then the first baseline period is a continuous 10-year period. If the amount of recycled water delivered in 2008 is 10 percent or greater, the first baseline period is a continuous 10- to 15-year period. *[2] The Water Code requires that the baseline period is between 10 and 15 years. However, DWR recognizes that some water suppliers may not have the minimum 10 years of baseline data.*

[3] The ending year must be between December 31, 2004 and December 31, 2010.

[4] The ending year must be between December 31, 2007 and December 31, 2010.

Appendix H – Intent to Retain Control of Conserved Water

RESOLUTION NO. 09-64

DECLARING AN INTENT TO RETAIN CONTROL OF CONSERVED WATER

WHEREAS, the City has contractual entitlements to divert water from Folsom Reservoir, under which the City diverts and treats water for distribution to its residents and water users; and

WHEREAS, the City plans to implement a series of water conservation projects and programs for the purpose of eliminating losses of water within its water transmission and distribution system and for reducing consumption of water by its customers through on-site efficiency improvements and curtailment of water waste; and

WHEREAS, Water Code section 1011 provides that water is deemed conserved when less water is used to accomplish the same purposes of use allowed under a water right and that such cessation or reduction in use is deemed a beneficial use of a water right to the extent of such cessation or reduction in use; and

WHEREAS, Water Code section 1011 and the City's CVP water service contract authorizes the City to make water conserved as a result of such water conservation projects and programs available for use, sale, lease, exchange or short- or long-term transfers inside and outside of the City; and

NOW, THEREFORE, BE IT RESOLVED by the Council of the City of Roseville as follows:

1. The foregoing recitals are true and are incorporated into this Resolution by this reference.

2. The City Council finds and determines that: (a) making significant investments in infrastructure and administrative resources protects the City's water supplies for the benefit of all residents and water users in the City; (b) protecting all of the City's water supplies is of paramount importance to the health and welfare of the City's residents and water users; (c) conserving water through reductions in use is intended to promote statewide policies mandating and encouraging beneficial use of water; and (d) preserving conserved water supplies and making those supplies available for use, sale or transfer is in the best interests of the City and its residents and water users.

3. The City Council declares that, by instituting programs to conserve water, it abandons no right, title or interest in or to any City water rights, contractual entitlements or any appurtenant rights necessary to exercise such water rights or entitlements.

4. In accordance with Water Code section 1011 and any contractual rights, the City reserves the right to sell, lease, exchange, or otherwise transfer for use within or outside of the City's boundaries all water that has been conserved as a result of its water conservation projects and programs.

5. The Environmental Utilities Director and staff are directed to take all actions necessary to implement this Resolution, including the filing of annual reports of reductions in water use resulting from any water conservation projects and programs carried out under this Resolution with the State Water Resources Control Board.

PASSED AND ADOPTED by the City Council of the City of Roseville on the 18th day of February 2009, by the following vote:

AYES COUNCILMEMBERS: Allard, Gray, Garcia, Roccucci, Garbolino

NOES COUNCILMEMBERS: None

EXECUTIVE SUMMARY

This report summarizes the results and recommendations of the Systems Evaluation prepared for the South Placer Wastewater Authority (SPWA), which is a Joint Powers Authority comprised of the City of Roseville (City), South Placer Municipal Utility District (SPMUD), and the County of Placer (Placer County). The Systems Evaluation was prepared by Woodard & Curran in close coordination with City, County and District staff. The Systems Evaluation will be used to guide improvements to the regional wastewater collection system and wastewater treatment plants to accommodate current and future development and ensure that SPWA's customers continue to receive a high level of service.

Background and Purpose of the Systems Evaluation

The South Placer Wastewater Authority (SPWA) was created under a Joint Powers Agreement in October 2000 and comprises the City of Roseville (City), South Placer Municipal Utility District (SPMUD), and the County of Placer (Placer County). Flow from SPMUD and portions of Placer County discharge into the City's sewer collection system. The City of Roseville, on behalf of the regional partners, owns and operates two regional wastewater treatment facilities: the Pleasant Grove Wastewater Treatment Plant (PGWWTP), and the older Dry Creek Wastewater Treatment Plant (DCWWTP). Additionally, the City of Roseville owns and operates the network of gravity sewers, pump stations, and force mains that serve customers within the City's limits, including the joint (regional) facilities that convey flow from the SPWA partners. SPMUD owns and operates gravity sewers, pump stations, and force mains in Rocklin, Loomis, and portions of southern Placer County. Placer County owns and operates gravity sewers, pump stations, and force mains in unincorporated areas of Placer County that are not served by other agencies.

The South Placer Regional Wastewater and Recycled Water Systems Evaluation prepared in 2009 (2009 Systems Evaluation), defined the SPWA service area boundary; evaluated the wastewater collection, wastewater treatment, and recycled water distribution systems; and identified existing and potential future improvement needs. Since that study was completed, the recycled water distribution system has been "removed" from the SPWA system (reallocated as an asset) and is now wholly managed by the City of Roseville. SPWA is now updating the Systems Evaluation to better evaluate future wastewater collection and treatment capacity needs that may have changed since 2009. This report documents the evaluation of the wastewater collection system capacity and the capacity of the wastewater treatment plants versus projected flows and loads.

This South Placer Regional Wastewater Systems Evaluation (Systems Evaluation) has been conducted to accomplish the following:

- Document the existing (2020) capacity and the flows and loadings on regional trunk sewer and wastewater treatment infrastructure and facilities present in 2020;
- Project buildout conditions based upon regional planning documents and planned regional developments in southwestern Placer County; and,
- Present a Regional Systems evaluation, with system deficiencies identified, and capital projects forecasted, which will inform the SPWA partners in identifying their ability to provide service for planned and proposed development both presently and for buildout conditions.

The service area is shown in **Figure 1-1**, and the regional collection system is shown in **Figure ES-2**. Figure 1-1 also indicates the location of the Urban Growth Areas (UGAs) within the service area, which are included in this study. Note that Creekview has been incorporated into the City of Roseville service area as of January 2019, while Amoruso and Sierra Vista are anticipated to be incorporated into the City's service area in early 2021.

Modeled Flow Projections

The flow projections developed for this Systems Evaluation were based on the information collected for the system's hydraulic model updates, including the updates performed for the current study. In 2007, a hydraulic model of the City's sewer collection system was developed using the H2OMap Sewer modeling platform (2007 Model Development Project), in parallel with a trunk sewer model for the combined Roseville, SPMUD, and Placer County systems. The models were later updated as part of the 2009 Systems Evaluation. Subsequently, the City's sewer model was updated in 2017 to reflect existing and future demands within the City, and to upgrade the modeling platform to the fully dynamic InfoWorks ICM software. For the current Systems Evaluation Update, the City's model was updated to reflect existing and future projected flows from Placer County and SPMUD.

Existing base wastewater flows were developed based on the assumptions summarized below; currently connected parcels are indicated in **Figure ES-3**. Note that flow projections (referred herein as loads) are intended to represent the level of development present during the flow monitoring periods used to calibrate the hydraulic model. Buildout loads were based on projected development within the service area. Two buildout scenarios were developed: (1) Buildout scenario representing the currently anticipated development density, and (2) Buildout-Sensitivity scenario, representing higher density development and some potential redevelopment areas.

For the City of Roseville, existing loads were developed based on water consumption data, and calibrated during the 2017 model update. A 15% rebound to reflect drought conditions was assumed for existing sewer loads. A buildout scenario was developed based on infill of currently vacant parcels using land use information from the City's General Plan or provided by the City's planning department, and development of UGAs within the City. The Buildout-Sensitivity scenario considers potential intensification and redevelopment in the downtown Roseville area.

Placer County provided spreadsheets summarizing existing equivalent dwelling units (EDUs) for each APN[1], which formed the basis of the existing model loads. (Note: an EDU is defined as the flow equivalent of one single-family residence.) For the Buildout scenario, flows were based on a spreadsheet provided by Placer County that summarized the anticipated EDUs for all entitled projects in Placer County[2], development of other currently vacant parcels (based on general plan data[2]), and development of the Placer County UGAs. For the Buildout scenario, an average development density for vacant parcels was assumed within the General Plan limits. For the Buildout-Sensitivity scenario, the development density was assumed to be at the maximum range allowed by the General Plan. A Base Wastewater Flowrate (BWF) of 180 gpd per EDU was assumed for Placer County and SPMUD.

SPMUD provided a shapefile[3] which provided EDUs for the year 2020 (which was identified as "existing" land use by SPMUD staff), and 2060 (which was identified as "Buildout" by SPMUD staff). This shapefile formed the basis of the Existing and Buildout scenarios.

For the UGAs, land use and flow projections were based on the most recent wastewater master plans for each UGA.

The locations of future developments, including urban growth areas, are indicated in **Figure ES-4.**

Model loads were calibrated based on temporary monitoring programs for the 2015/2016 wet weather season (30 meters for the City's 2017 Model Update) and 12 meters during the 2018/2019 wet weather season (for SPMUD and Placer County). V&A Consulting Engineers, under subcontract to Woodard & Curran, conducted the monitoring. As part of the calibration process, rates of wet season groundwater infiltration (GWI, observed as a constant additional flow throughout the monitoring period), and rainfall-dependent inflow and infiltration (RDI/I) were calculated. Existing and projected flows predicted by the model are summarized in **Table ES-1** and **Table ES-2**.

Table ES-1: Estimated Dry Weather Flows[a] by Agency

WWTP	Agency	Existing Calibration ADWF (mgd)	Existing ADWF with Drought Rebound	Buildout ADWF (mgd)	Buildout-Sensitivity[b] ADWF (mgd)
Pleasant Grove	Roseville	5.87	6.70	13.01	13.04
	Placer County	0.18	0.20	9.85	9.85
	SPMUD	2.25	2.97	3.63	3.63
	Total	**8.30**	**9.87**	**26.49**	**26.52**
Dry Creek	Roseville	5.60	6.27	6.89	8.23
	Placer County	2.57	2.81	7.19	7.42
	SPMUD	2.90	3.64	5.16	5.16
	Total	**11.06**	**12.72**	**19.24**	**20.81**

Notes:
a. Includes wet season GWI.
b. For the Buildout-Sensitivity scenario, the development density was assumed to be at the maximum range allowed by the General Plan. A Base Wastewater Flowrate (BWF) of 180 gpd per EDU was assumed for Placer County and SPMUD

Table ES-2: Modeled ADWF And Peak WW Flow Summary

	Existing (Rebound)			Buildout			Buildout-Sensitivity		
WWTP	BWF[a] (mgd)	ADWF (mgd)	PWWF[b] (mgd)	BWF[a] (mgd)	ADWF (mgd)	PWWF[b] (mgd)	BWF[a]	ADWF (mgd)	PWWF[b] (mgd)
Pleasant Grove	9.5	9.9	27.4	26.1	26.5	55.8	26.2	26.5	56.0
Dry Creek	10.1	12.7	41.9	16.7	19.2	59.2	18.2	20.8	60.6

Notes:
a. Does not include wet season groundwater infiltration (GWI).
b. Modeled PWWF assumes improvements have been implemented to eliminate overflows and significant surcharging.

Trunk Sewer Evaluation

The calibrated model was run for Existing, Buildout, and Buildout-Sensitive land use scenarios under the design event described above. Several deficiencies were identified in non-regional facilities which resulted in model-predicted overflows for one or more of the scenarios; to ensure flows were conveyed to regional sewers, pipes were upsized in this analysis to eliminate any overflows. As the current model is a calibrated fully-dynamic model, the design condition represents a relatively infrequent storm event, and many of SPWA's sewers are relatively deep, surcharging up to within 5 feet of the manhole rims (ground surface) was considered acceptable under 10-year design storm PWWF, as long as the surcharge (flow height in the manhole) does not exceed 4 feet from the top of pipe up the manhole.

Model results under Existing and Buildout conditions are summarized in **Table ES-3** and results for the Buildout scenario are shown in **Figure ES-5**. Within the regional system, seven deficiency areas have been identified as indicated in **Figure ES-5**. There was no significant difference in modeled surcharge between the Buildout and Buildout-Sensitivity scenarios.

Table ES-3: Sewer Capacity Results under Existing and Buildout Land Use Scenarios[a]

Area	Existing (with Rebound)			Buildout and Buildout-Sensitivity		
	Length of Throttle Surcharge (ft)	Maximum Surcharge Depth (ft)	Minimum Freeboard (ft)	Length of Throttle Surcharge (ft)	Maximum Surcharge Depth (ft)	Minimum Freeboard (ft)
A	5,530	7.3	0.0	5,530	7.8	0.0
B	3,369	1.9	2.0	3,948	7.7	0.0
C	522	1.0	7.4	6,009	6.4	2.8
D	700	1.1	8.6	4,220	3.3	6.4
E	--	--	--	2,223	3.1	5.6
F	--	0.9	12.2	1,716	7.3	2.2
G	--	--	--	0	2.3	6.3

Notes:

a. Areas that exceed the hydraulic capacity criteria but do not have modeled overflows are highlighted yellow, while areas with modeled overflows are highlighted orange.

Based on these model results, improvement projects have been identified to relieve the capacity deficiencies. Improvement Project 1 would relieve existing deficiencies, while Improvement Project 2 and 3 would relieve deficiencies identified in the Buildout system. Improvement Project 2 and 3 would largely be triggered by additional growth in Placer County's SMD2 and SMD3 service areas. Subsequent model runs were performed to estimate the number of EDUs that would trigger the need for these additional projects; based on this analysis, the projects would be needed after approximately 1,800 additional EDUs (compared to 2018 development). Based on the EDU projections provided by Placer County, this additional growth is not anticipated until after Fiscal Year (FY) 2059/2060. Note that this estimate is based on dry weather flows and rainfall response estimated as part of the model update; changes in these projected flows may occur (in the future with additional flow monitoring and model updates) which would trigger the need for the projects earlier, or delay or eliminate the need for the projects.

The proposed capacity improvement projects are summarized in **Table ES-4** and the locations are shown in **Figure ES-6**.

Table ES-4: Proposed Capacity Improvement Projects

Project	Description	Estimated Capital Improvement Cost	Approximate Additional EDUs in SMD2/SMD3 to Trigger Project[a]
1	Increased Capacity of PS 26 and sewers on Sierra College Blvd directly downstream of PS 26 to relieve Old Auburn Trunk sewer (Area A)	$1,606,000	Existing
2	Redirect flows from PS 26 and Sierra College Blvd down Eureka Road to relieve Area E.	$1,831,000	~1,800[b]
3	Increased Firm capacity of PS 25 to meet Buildout PWWF. New weir structure or adjustments to existing structure at PS 25 to convey the maximum potential flow through PS 25 without any dry weather flows.	$758,000	~1,800[c]

Notes:

a. Based on a percentage of buildout factor applied to future model loads. Represents approximately 60% of buildout.

b. There are approximately 8,400 Existing EDUs upstream of the deficiency triggering Improvement Project 2, and approximately 10,200 EDUs would trigger the need for improvement. Represents approximately 60% of buildout.

c. There are approximately 11,900 Existing EDUs upstream of the deficiency triggering Improvement Project 3, including 7,600 in Placer County, 4,200 in Roseville, and less than 100 in SPMUD. Approximately 13,700 EDUs would trigger the need for the improvement.

Wastewater Treatment Plant Expansion Evaluation

Based on the updated growth projections provided by the SPWA partners, wastewater flow and loading (organic loading as measured by Biochemical Oxygen Demand, or BOD, and solids loading as measured by Total Suspended Solids, or TSS) projections were developed for the Dry Creek Wastewater Treatment Plant (DCWWTP) and Pleasant Grove Wastewater Treatment Plant (PGWWTP). The flow and loading projections were compared to the most recent evaluations of treatment plant capacity from 2009 for DCWWTP and from 2016 for PGWWTP. Projected shortfalls in hydraulic capacity or biological treatment capacity were identified and preliminary recommendations for expansion and upgrade projects were proposed. The recommendations address phasing, timing, and preliminary conceptual costs of the expansions required through buildout to address both flows and loads, as well as identifying next steps for confirming current plant capacity and refining expansion and upgrade projects.

Wastewater Flow and Loading Evaluation

Current influent flows and loadings for both plants were established by analyzing daily plant influent data provided by the City of Roseville for the period from January 1, 2016 through September 19, 2019 for influent flow and from January 1, 2013 through September 19, 2019 for wastewater loadings. Notably, the waste loadings for biochemical oxygen demand (BOD) over the past 6 years have been significantly higher than documented for prior studies and design projects. In previous studies, average BOD concentrations of 248 mg/L at DCWWTP and 285 mg/L at PGWWTP were documented. The 2013-2019 data set shows an average influent BOD concentration of 425 mg/L at DCWWTP and 358 mg/L at PGWWTP. These higher concentrations may be a result of water conservation efforts over the past decade combined with the drought conditions that were experienced throughout California from 2011-2016, but should be confirmed through additional testing. While TSS and nutrient loadings were also calculated, now that the Roseville WWTPs are addressing nutrient removal in their water quality strategies, the focus herein is on organic loading, as measured by BOD, because that is where the capacity constraints present themselves.

Projected flows were calculated based on population and non-residential growth, normalized to account for diversity in land uses by establishing equivalent dwelling units (EDUs). EDU projection data were provided by each of the SPWA partners. Flow projections were developed by multiplying the projected EDUs by an ADWF contribution of 190 gallons per day (gpd) per EDU, in accordance with the estimate developed in the 2009 Systems Evaluation (a conservative value used for regional treatment capacity planning).

The plant data show that current BOD loadings are higher than the BOD treatment capacities estimated in the prior reference documents for both plants. However, according to City staff, the plants have consistently been in compliance with their NPDES discharge permits. This suggests that the **actual** plant capacities are beyond their **nomina**l design capacity with respect to BOD. Additionally, it is unclear to what extent interim improvements such as the Nitrate Reduction Improvements project at DCWWTP have affected the plant capacity. For the purposes of this Systems Evaluation, it is assumed that the annual average BOD removal capacity at each plant is, at minimum, the same as the current BOD loadings. It is recommended that process-specific sampling, process modeling, and, if needed, stress testing be performed to determine the actual plant capacity, the limiting processes, and corresponding process improvements needed at each plant. While this evaluation will be immediately helpful at Pleasant Grove, it is immediately essential at Dry Creek because of the large discrepancy between current loading and nominal capacity.

The current and projected flows and loadings to the treatment plants are summarized in **Table ES-5** along with the treatment capacities based on current operating conditions. This comparison of current plant capacity and projected future flows and loads accounts for only hydraulic and carbonaceous BOD treatment capacity because these parameters have driven capacity expansion timing in the past (vs. TSS and nutrient treatment capacity). Potential nutrient removal requirements have not been considered in expansion timing and phasing. Evaluation of plant capacity with respect to TSS and nutrient removal should be incorporated into the subsequent analysis of plant capacity.

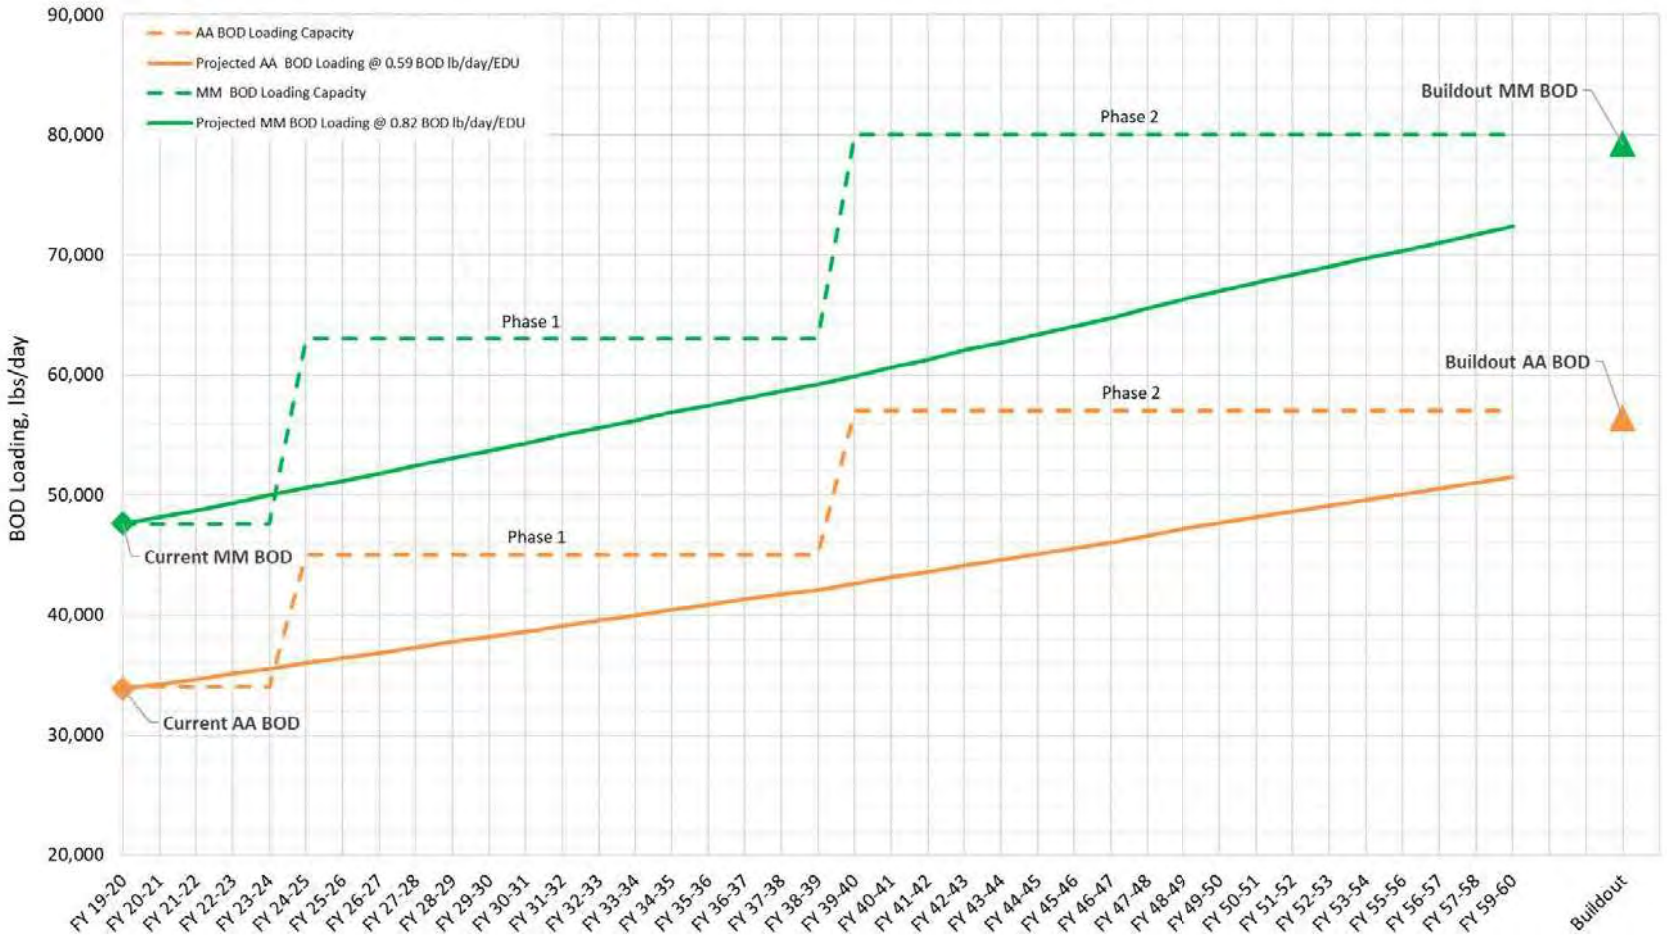
Table ES-5: Current and Projected Flows and Organic (BOD) Loadings

Parameter	Condition	Unit	Capacity			
				Current	FY59/60	Buildout
Dry Creek Wastewater Treatment Plant						
EDU		#		57,747	87,772	96,000
Flow	Average Dry Weather Flow	mgd	18	8.6	16.7	18.2
BOD	Annual Average Loading	lbs/day	33,900[1]	33,900	52,000	56,000
Pleasant Grove Wastewater Treatment Plant						
EDU		#		54,907	92,864	145,000
Flow	Average Dry Weather Flow	mgd	12[2]	7.6	17.6	27.6
BOD	Annual Average Loading	lbs/day	22,400[1]	22,400	38,000	60,000

Notes:

1. Current BOD loadings based on plant data from January 2013 through September 2019.
2. Plant improvements that expand treatment capacity at PGWWTP are currently under construction and are expected to be in service by FY 22-23.

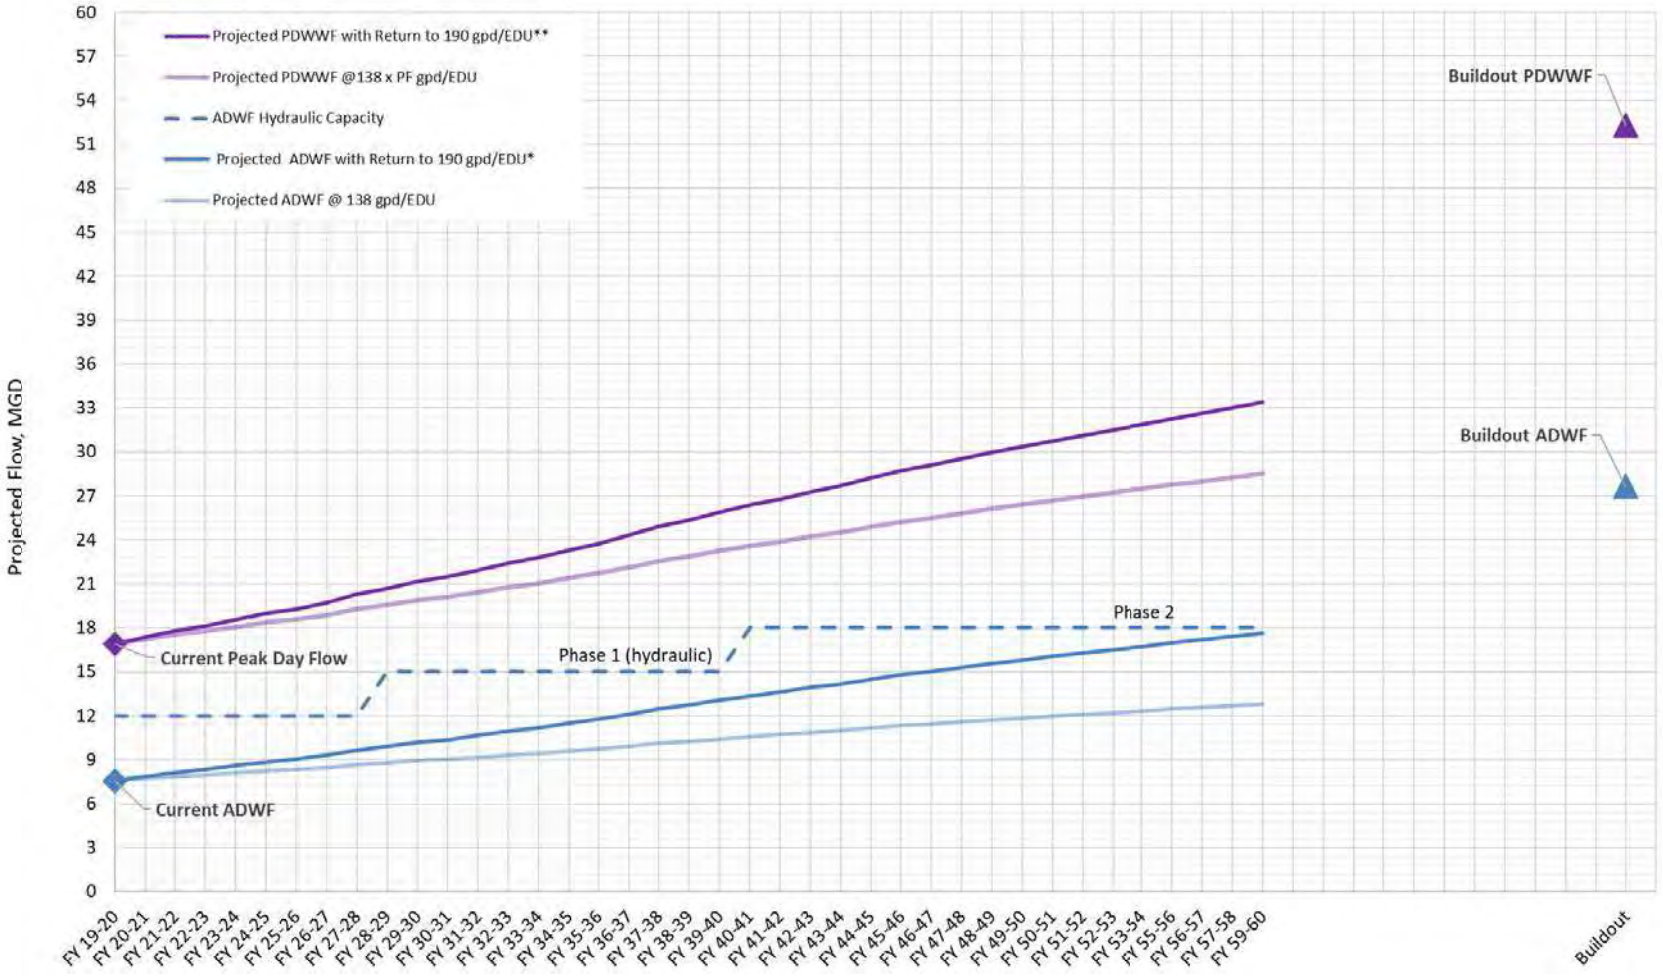
Recommended Expansion Phasing



Prior to implementing any further improvements, it is recommended that process-specific sampling, process modeling, and if needed, stress testing be performed to determine the actual plant capacity, the limiting process, and corresponding process improvements needed at each plant.

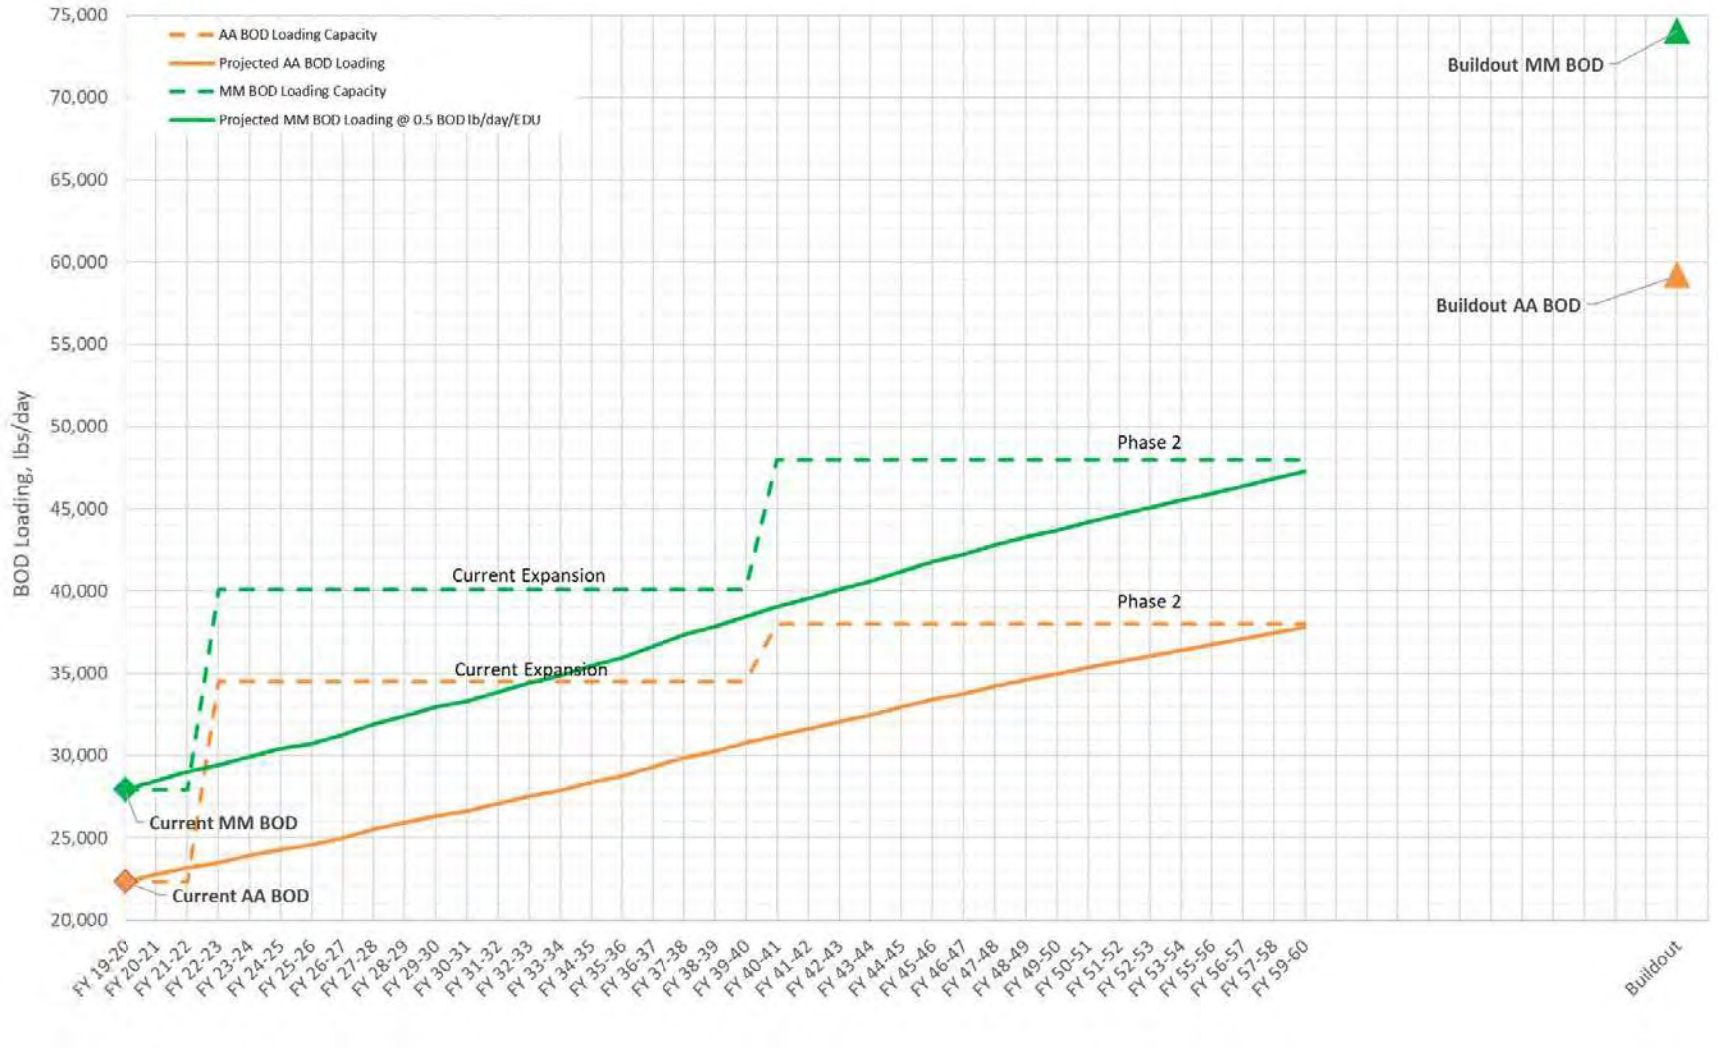
Dry Creek Wastewater Treatment Plant. Based on the projected ADWF of 16.7 for FY 59/60 and 18.2 mgd for buildout, the current ADWF hydraulic capacity of 18 mgd is effectively sufficient through buildout. As shown in **Table ES-5**, DCWWTP appears to be currently running at or beyond its nominal design capacity with respect to BOD loading. **Figure ES-7** shows annual average (AA) and maximum monthly (MM) biological treatment capacities plotted against the loadings projected over the planning period and the anticipated expansion phasing. Depending on the results of the capacity testing, a Phase 1 expansion project may be necessary in approximately FY 24/25, which is the earliest practical time frame considering planning, design, and construction duration. The plant will reach 94% of the expanded Phase 1 AA and MM BOD loading capacity in FY 39/40. Therefore, it is recommended to implement Phase 2 biological improvements at this time. Phase 2 improvements in FY 39/40 are recommended to bring the plant BOD loading capacity to its buildout AA and MM projections of 56,000 and 79,000 lbs/day, respectively. The timing and magnitude of the recommended projects should be refined after additional capacity analysis and facility planning is completed, as described in the 3rd paragraph in the Wastewater Flow and Loading Evaluation section above.

Pleasant Grove Wastewater Treatment Plant. The improvements currently under construction will expand PGWWTP's treatment capacity to 12 mgd by FY 22-23. Based on the ADWF projections, this capacity expansion should be sufficient to handle flows through FY 28-29, though timing would depend on whether any rebound in sewer flows occurs.. Based on current estimates of capacity, Phase 1 hydraulic expansion at PGWWTP may be needed by approximately FY 28-29 to expand the plant ADWF to 15 mgd. Phase 1 expansion would carry the PGWWTP through FY 40-41. At that point, Phase 2 improvements may be needed to increase the plant ADWF capacity to the FY 59/60 flow projections of 17.6 mgd. Figure ES-8 shows ADWF plotted against the flow projected over the planning period and the anticipated phasing for improvements.



As shown in **Table ES-5**, PGWWTP is currently running at or beyond its nominal design capacity with respect to BOD loading. **Figure ES-9** shows AA and MM biological treatment capacities plotted against the loadings projected over the planning period and the anticipated expansion phasing. The improvements currently under construction will expand the plant's AA and MM BOD loading capacities to 34,500 lbs/day and 40,100 lbs/day, respectively. These improvements should be sufficient to meet projected BOD loadings through FY 40/41 when Phase 2 hydraulic capacity improvements are recommended at PGWWTP. During Phase 2 expansion, it is recommended that plant capacity be increased to accommodate projected FY59/60 AA and MM BOD loadings of 38,000 lbs/day and 48,000 lbs/day, respectively. The timing and magnitude of the recommended projects should be refined after additional capacity analysis and facility planning is completed, as described in the Wastewater Flow and Loading Evaluation section above.

Figure ES-7: DCWWTP Biological Capacity Comparison



* Buildout date is currently unknown and is shown for graphical purposes only.

Figure ES-8: PGWWTP Hydraulic Capacity Comparison

* ADWF GPD/EDU factor is assumed to reach 190 gpd/EDU by FY 59/60, with a linear increase from 138 gpd/EDU at FY 19/20
**PDWWF is assumed to be ADWF flow plus 170 gpd/EDU of wet weather flow, based on current wet weather flowrates
*** Buildout date is currently unknown and is shown for graphical purposes only.

Figure ES-9: PGWWTP Biological Capacity Comparison

* Buildout date is currently unknown and is shown for graphical purposes only.

Conceptual Level Capital Cost Estimates

Preliminary opinions of probable cost at the conceptual level were developed for the recommended expansion phases. Estimates were developed by extrapolating from process unit cost estimates found in prior plant studies and applying appropriate escalation factors, allowances, and contingencies. Improvements that may be required after the FY 59/60 planning horizon have not been estimated.

Dry Creek Wastewater Treatment Plant. The preliminary phased improvements on a process basis are provided in **Table ES-6.** The listed improvements in Phase 1 (FY 24/25) will increase the AA BOD treatment capacity from 34,000 to 45,000 lbs/day (an equivalent increase in plant ADWF capacity from 11.5 mgd to 14.5 mgd). In Phase 2 (FY 39/40), the improvements will increase the AA BOD treatment capacity from 45,000 to 57,000 lbs/day (an equivalent increase in plant ADWF capacity from 14.5 mgd to 18 mgd). It should be emphasized that the cost estimates provided below are conceptual level costs for capacity expansion projects and do not include rehabilitation and replacement projects or discretionary projects. More detailed cost estimating should be developed when the plant capacity is determined and phased improvement projects are updated accordingly.

Pleasant Grove Wastewater Treatment Plant. The preliminary phased improvements on a process basis are provided in **Table ES-7.** The recommended phased improvements in Phase 1 (FY 28-29) increase the plant ADWF capacity from 12 mgd to 15 mgd. Phase 2 improvements will increase the ADWF capacity from 15 mgd to 18 mgd and the AA BOD treatment capacity from 35,000 to 38,000 lbs per day. It should be emphasized that the cost estimates provided below are conceptual level costs for capacity expansion projects and do not include rehabilitation and replacement projects or discretionary projects. More detailed cost estimating should be developed when the plant capacity is determined, and phased improvement projects are updated accordingly.

Table ES-6: DCWWTP Phase 1 and Phase 2 Capital Cost Estimates (ENR CCI: 12115)[a]

Process	Process Unit Cost	Phase 1 FY 24/25	Phase 2 FY 39/40
		# of units	# of units
Coarse Screens	$280,000	-	1

Capacity Improvement Project Summary

Table ES-8 summarizes the capacity improvements identified in this systems evaluation. Note that the improvement needs projected for Dry Creek and Pleasant Grove WWTPs are significantly larger and more expensive than the improvement projects projected for the collection system, but are based on limited available data. The estimated costs for Dry Creek WWTP are especially high because of the size and age of that plant; when it was designed, the organic loading in Roseville was far lower than when Pleasant Grove was designed; since the mid 2000's organic loading to both plants has continued to increase. Further studies, as described in the Wastewater Flow and Loadings Section should be undertaken for both treatment plants, and the capacity improvement projects should be refined based on those findings.

Table ES-8: Proposed Capacity Improvement Projects

		Existing	FY 24/25 or FY 28/29	FY 39/40	After FY 59/60
Collection System	**Description**	Improvement Project 1 (Increased Capacity of PS 26 and sewers on Sierra College Blvd)	None	None	Improvement Project 2 (Redirect flows from PS 26 and Sierra College Blvd down Eureka Road) Improvement Project 3 (Increased Firm capacity of PS 25 with diversion structure improvements)
	Estimated Capital Cost	$1,610,000	-	-	$2,590,000
Dry Creek WWTP	**Description**	Plant Capacity, Condition Assessment, and Facilities Plan	Phase 1 (Increase AA BOD Capacity to ~45,000 lbs/day)	Phase 2 (Increase AA BOD Capacity to ~57,000 lbs/day)	Phase 3: Increase BOD Capacity and Hydraulic Capacity (not estimated)
	Estimated Capital Cost	$550,000	$88,000,000	$110,000,000	Not Estimated
Pleasant Grove WWTP	**Description**	Plant Capacity, Condition Assessment, and Facilities Plan	Increase ADWF hydraulic capacity to 15 mgd	Increase ADWF hydraulic capacity to 18 mgd. Increase AA BOD Loading Capacity to 38,000 lbs/day	Phase 3: Increase BOD Capacity and Hydraulic Capacity (not estimated)
	Estimated Capital Cost	$450,000	$33,000,000	$41,000,000	Not Estimated

Next Steps

Based on the findings of this preliminary evaluation, and discussions with the project team the following next steps are recommended for consideration by SPWA:

- Conduct an analysis of process performance and current biological treatment and hydraulic capacity at both DCWWTP and PGWWTP. This will likely require process-specific sampling and development of calibrated process models. Biological treatment capacity should consider both BOD and nitrate plus nitrite permit limitations set forth within each plant's respective NPDES permit. Results of this study should determine a capacity rating for each unit process at the plant and the limiting processes. This analysis will provide a sound basis for the planning of new facilities and is integral to determining required future capital improvement projects during phased expansions. It is recommended that DCWWTP capacity analysis take precedence over PGWWTP considering DCWWTP appears to be currently operating beyond its nominal BOD removal capacity.

- Review previous condition assessment work conducted on the plant assets and perform additional assessment needed to identify and prioritize repair and replacement (R&R) projects. This effort would include a risk assessment to identify likelihood of failure and criticality of each asset. Results of this study would identify R&R projects which may need to be implemented prior to or concurrent with phased expansions.

- Based on the capacity analysis and R&R project planning, develop Facilities Plans for DCWWTP and PGWWTP. Considering both plants could be running at or above their nominal design capacities, it is recommended that facilities planning begin immediately after the capacity analysis. This effort would evaluate various process optimization steps and upgrade alternatives and provide recommended improvements for phased expansions. The Facilities Plans would include review of the 190 gpd/EDU flow factor that is critical to the timing and magnitude of any hydraulic capacity improvements.

- Develop Class 4 cost estimates for recommended improvements at the WWTPs under each expansion phase and for R&R projects to assist SPWA partners in assessing capital needs in the future.

- For the collection system, periodically update the model network based on any configuration changes, perform re-calibration to confirm the actual and anticipated flows, and to update future loads into the model network. An update frequency of every 5-10 years is recommended, depending on changes in development planning and/or system configuration.

We also recommend that SPWA evaluate funding and financing options to support implementation of the recommended capital improvements, especially Phase 1 at Dry Creek given its size and relative immediacy. With the implementation of the steps above, and the ongoing high level performance of the SPWA Regional System, SPWA will be able to continue its excellent level of service to the Regional Partners.

1. INTRODUCTION

The South Placer Wastewater Authority (SPWA) was created under a Joint Powers Agreement in October 2000 and comprises the City of Roseville (City), South Placer Municipal Utility District (SPMUD), and the County of Placer (Placer County). Flow from SPMUD and portions of Placer County discharge into the City's sewer collection system. The City of Roseville, on behalf of the regional partners, owns and operates two regional wastewater treatment facilities: the Pleasant Grove Wastewater Treatment Plant (PGWWTP), and the older Dry Creek Wastewater Treatment Plant (DCWWTP). Additionally, the City of Roseville owns and operates the network of gravity sewers, pump stations, and force mains that serve customers within the City's limits, including the joint (regional) facilities that convey flow from the SPWA partners. SPMUD owns and operates gravity sewers, pump stations, and force mains in Rocklin, Loomis, and portions of southern Placer County. Placer County owns and operates gravity sewers, pump stations, and force mains in unincorporated areas of Placer County that are not served by other agencies.

Figure 1-1 shows the service area boundaries of the SPWA partner agencies and the overall SPWA service area. **Figure 1-1** also indicates the location of several Urban Growth Areas (UGAs), both inside and outside the City, which have significant development plans under varying stages of progress.

The South Placer Regional Wastewater and Recycled Water Systems Evaluation prepared in 2009 (2009 Systems Evaluation), defined the SPWA service area boundary; evaluated the wastewater collection, wastewater treatment, and recycled water distribution systems; and identified existing and potential future improvement needs. Since that study was completed, the recycled water distribution system has been removed from the SPWA system (reallocated as an asset) and is now wholly managed by the City of Roseville. SPWA is now updating the Systems Evaluation to better evaluate future wastewater collection and treatment capacity needs that may have changed since 2009. This report documents the evaluation of the regional wastewater collection system capacity and the capacity of the wastewater treatment plants versus projected flows and loads.

1.1 Objectives of the Systems Evaluation

The specific need for this Systems Evaluation was precipitated by several factors, including:

- Recent annexations of land by SPWA partner agencies;
- Changes in water consumption rates and associated dry weather flow rates;
- Planned development and redevelopment within the 2005 SPWA service area;
- Revisions in the planning for proposed Urban Growth Areas (UGAs) in the vicinity of the 2005 SPWA service area;
- Wastewater characteristics (i.e., flow and strength) that have changed since the 2009 Systems Evaluation.

This South Placer Regional Wastewater Systems Evaluation (Systems Evaluation) has been conducted to accomplish the following:

- Document the existing (2020) capacity and the flows and loadings on regional trunk sewer and wastewater treatment infrastructure and facilities present in 2020;
- Project buildout conditions based upon regional planning documents and planned regional developments in southwestern Placer County; and,
- Present a Regional Systems evaluation, with system deficiencies identified, and capital projects forecasted, which will inform the SPWA partners in identifying their ability to provide service for planned and proposed development, both presently and for buildout conditions.

1.2 Project Scope

The scope of the Systems Evaluation, as well as a brief discussion of work conducted under each task, is described below.

- **Task 1 – Project Management.**

  Periodic progress meetings were held with City staff to review project status and discuss project issues, and monthly status reports were prepared to document the work completed.

- **Task 2 – Data Collection and Review.**

  This task involved assembling, organizing, and reviewing information and data related to the sewer system, including previous reports; maps and drawings of sewer system facilities and recent sewer improvement projects; water use and customer account data; the City's General Plan and other relevant planning information; and sewer design standards and specifications. This task also included meetings with City Planning staff, Placer County and SPMUD to confirm growth and future land use assumptions within the City of Roseville as well as from the SPWA partners outside the City.

- **Task 3 – Flow Monitoring.**

  A plan for flow and rainfall monitoring in the collection system during the 2015/16 wet weather season was developed. The program included 30 temporary flow meters (including 5 meters authorized by Task 5) and two rain gauges installed for a period of approximately two months (mid-January through mid-March). Gauge adjusted radar rainfall (GARR) data was also obtained for the rainfall periods. The monitoring was conducted by Woodard & Curran's subconsultant, V&A Consulting Engineers, and the GARR data was provided by OneRain, Inc.

- **Task 4 – Model Update and Calibration.**

  A hydraulic model of the City's trunk sewer system was developed using InfoWorks™ ICM software. The model network was developed using as-builts, the City's GIS data, and information from the 2005 Model Development Project. Flow loads to the model were compiled using water use and land use data and flow factors representing unit base wastewater flow (BWF) rates, diurnal BWF patterns, and infiltration/inflow (I/I). The model was calibrated for dry and wet weather conditions using the flow monitoring data collected under Task 2.

- **Task 5 – Update Flow Projections.**

  Based on data collected under Task 2 and discussions with SPWA and partner agencies' staff, existing and projected flows were developed. As part of this task, the best available planning information was collected and documented, including plans for Urban Growth Areas and parcel based data within the agencies' current service areas. A database of parcel-based projections within the SPMUD and Placer County Service areas was also prepared in this task. This information was used to estimate future flows and potential capacity needs.

- **Task 6 – Trunk Sewer Evaluation**

  In this task, the existing trunk sewers were evaluated against hydraulic performance criteria under the design storm conditions identified for the 2009 System Evaluation. Using the calibrated model and the selected design storm, existing and future model runs were performed to identify capacity deficiencies in the trunk sewer system. For those deficiencies, capacity improvement projects were developed.

- **Task 7 – Wastewater Treatment Plant Expansion Evaluations**

Based on the flow projections developed in Task 5 and buildout timeline information provided by City of Roseville, Placer County, and SPMUD, design flows and biological loading for both the Dry Creek and Pleasant Grove Wastewater Treatment Plants were developed. Based on these design flows and work completed by the City of Roseville, phased WWTP capacity expansions were identified considering current and future changes in regulatory requirements, and preliminary cost estimates were developed.

- **Task 8 – Prepare Systems Evaluation**

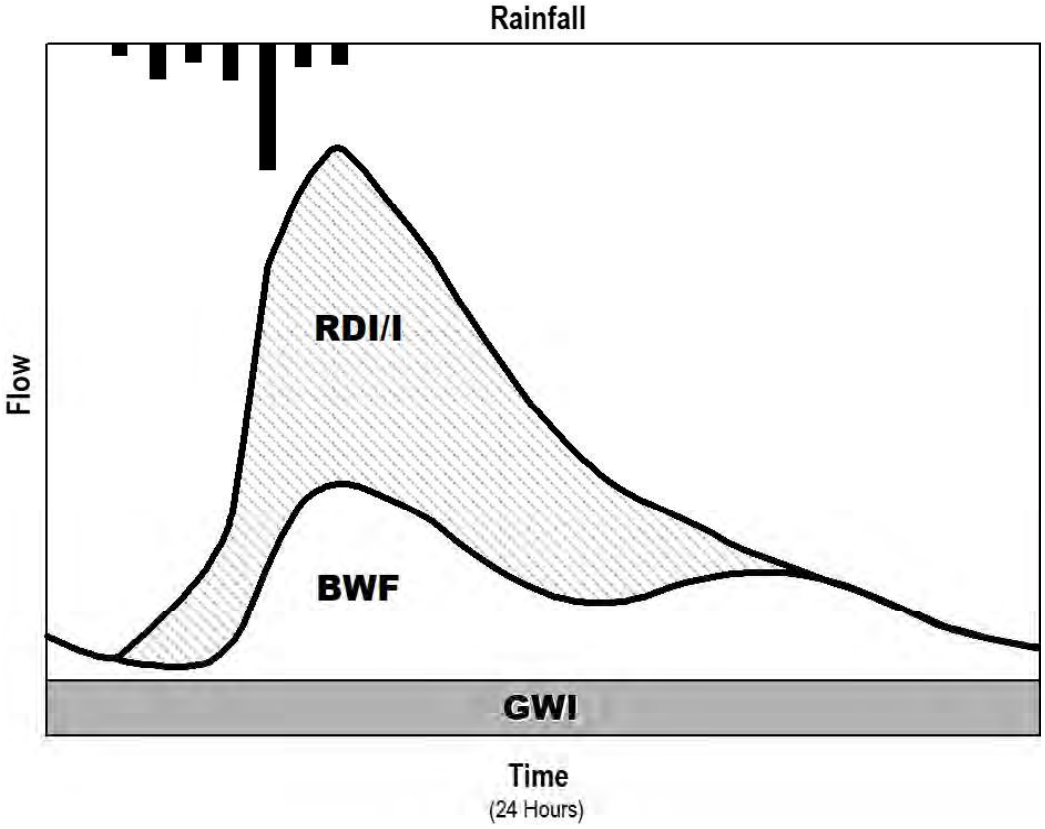
  This report was prepared to summarize and present the results and recommendations of the study.

1.3 Report Organization

This report includes five chapters, which are described below

- **Chapter 1, Introduction,** presents the background, objectives, and scope of the System Evaluation.
- **Chapter 2, Modeled Flow Projections,** discusses the service area land use projections, the basis for developing estimates for each component of wastewater flows, and the base wastewater flow projections for the service area.
- **Chapter 3, Trunk Sewer Evaluation,** describes the modeled trunk sewer system, development of the model network and model loads, flow monitoring program, and model calibration. This chapter also identifies the results of the capacity analysis, including preliminary solutions for the identified capacity deficiencies.
- **Chapter 4, Wastewater Treatment System Evaluation,** summarizes the wastewater treatment upgrade and expansion analyses performed for the Systems Evaluation, including the development of flow and loading peaking factors, facility expansion recommendations to handle projected flows and loadings at buildout, and a timeline for phasing the construction of the improvements.
- **Chapter 5, Capacity Improvement Summary,** summarizes the recommended capacity improvements, including project costs, phasing, and implementation recommendations.

2. BASIS OF FLOW PROJECTIONS



2.1 Introduction

The flow projections developed for this Systems Evaluation were based on the information collected for the system's hydraulic model updates, including the updates performed for the current study. In 2007, a hydraulic model of the City's sewer collection system was developed using the H2OMap Sewer modeling platform (2007 Model Development Project), in parallel with a trunk sewer model for the combined Roseville, SPMUD, and Placer County systems. The models were later updated as part of the 2009 Systems Evaluation. Subsequently, the City's sewer model was updated in 2017 to reflect existing and future demands within the City, and to upgrade the modeling platform to the fully dynamic InfoWorks ICM software. For the current Systems Evaluation Update, the City's model was updated to reflect existing and future projected flows from Placer County and SPMUD.

This section describes the flow components used in the hydraulic model and the existing and projected future land uses for the service area, which form the basis for generating base wastewater flows, in the current hydraulic model. Note that flow projections (referred herein as loads) are intended to represent the level of development present during the flow monitoring periods used to calibrate the hydraulic model. Design flow estimates were developed based on criteria developed for each component of wastewater flows: base wastewater flow (BWF), groundwater infiltration (GWI), and rainfall-dependent infiltration and inflow (RDI/I), and confirmed through model calibration, as described in Chapter 3. Average dry weather flow (ADWF) projections for each treatment plant area discussed in the Wastewater Treatment Plant Expansion Evaluations TM.

The three components of wastewater flows are illustrated conceptually in **Figure 2-1**. BWF represents the sanitary and process flow contributions from residential, commercial, institutional, and industrial users of the system. GWI is groundwater that infiltrates into defects in sewer pipes and manholes, particularly in winter and springtime in low-lying areas. GWI is typically seasonal in nature and remains relatively constant during specific periods of the year. ADWF represents the average flows at each WWTP from July to September. The source of these flows is a combination of BWF and GWI. RDI/I is storm water inflow and infiltration that enter the system in direct response to rainfall events, through direct connections such as holes in manhole covers or illegally connected roof leaders or area drains, or, more commonly, through defects in sewer pipes, manholes, and service laterals. RDI/I typically results in short term peak flows that recede quickly after the rainfall ends.

Figure 2-1: Wastewater Flow Components
(Not to scale)

2.2 Average Dry Weather Flow

ADWF has been estimated for four development scenarios: (1) Existing loads for model calibration; (2) Existing loads for capacity analysis; (3) Buildout; and (4) Buildout Sensitivity, which includes some additional densification and redevelopment assumptions based on feedback from the SPWA partners. As part of this Systems Evaluation, a database of existing and future loads for each parcel in Placer County and SPMUD service areas has been developed and provided to the City. As noted above, ADWF includes two components: GWI and BWF.

In 2007, a hydraulic model of the City's sewer collection system was developed using the H2OMap Sewer modeling platform (2007 Model Development Project), in parallel with a trunk sewer model for the combined Roseville, SPMUD, and Placer County systems. The models were later updated as part of the 2009 Systems Evaluation. Subsequently, the City's sewer model was updated in 2017 to reflect existing and future demands within the City, and to upgrade the modeling platform to the fully dynamic InfoWorks ICM software. For the current Systems Evaluation Update, the City's model was updated to reflect existing and future projected flows from Placer County and SPMUD.

This section describes the flow projections and model development process used to evaluate the SPWA collection system (sewers conveying flows from more than one partner agency), as well as findings from that effort.

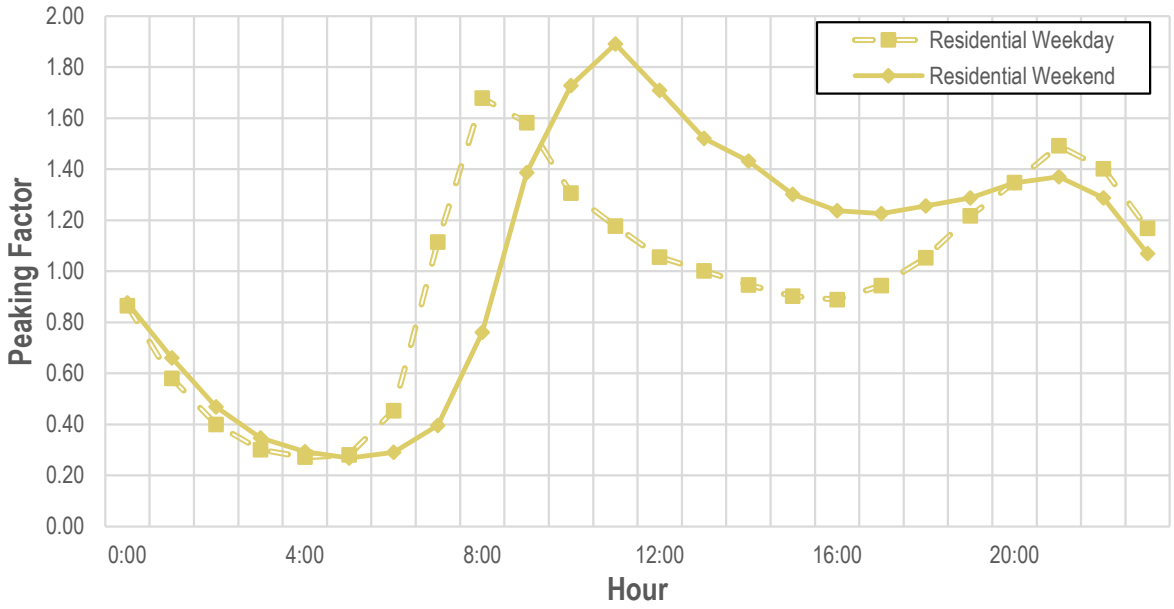
2.2.1 Diurnal Base Wastewater Flow Curves

BWF varies throughout the day in a typical way, generally peaking early in the morning in upstream sewers and later and less sharply in larger downstream sewers. Typical hourly peak flows from small residential areas tend to be about twice the average flow (or even higher for very small areas), whereas peak flows further downstream may be less than 1.5 times average flows due to flow attenuation in the collection system. Higher peaks can occur on atypical days of the year (e.g., on major holidays such as Thanksgiving or at halftime on Super Bowl Sunday).

For the current Systems Evaluation Update, typical diurnal profiles were developed for residential and commercial/industrial (non-residential) wastewater flow, for both weekend and weekday conditions. These hydraulic profiles are shown in **Figure 2-2** and **Figure 2-3.** The residential profiles were developed based on monitored flows for smaller, primarily residential meter areas and refined during calibration. Two non-residential profiles were developed to represent flow patterns from two different types of uses: commercial/retail pattern, and an industrial/professional pattern. For parcels inside the City, each non-residential parcel was assigned a non-residential diurnal profile according to the land use code in the parcel database; a summary of the diurnal profile assigned to each land use code is provided in Appendix A. For non-residential parcels in Placer County and SPMUD, the commercial/retail pattern was used.

For UGAs, the residential profile was used for all residential uses, and the retail/commercial diurnal profile was used for all non-residential and mixed use land uses.

Figure 2-2: Residential Diurnal Curves



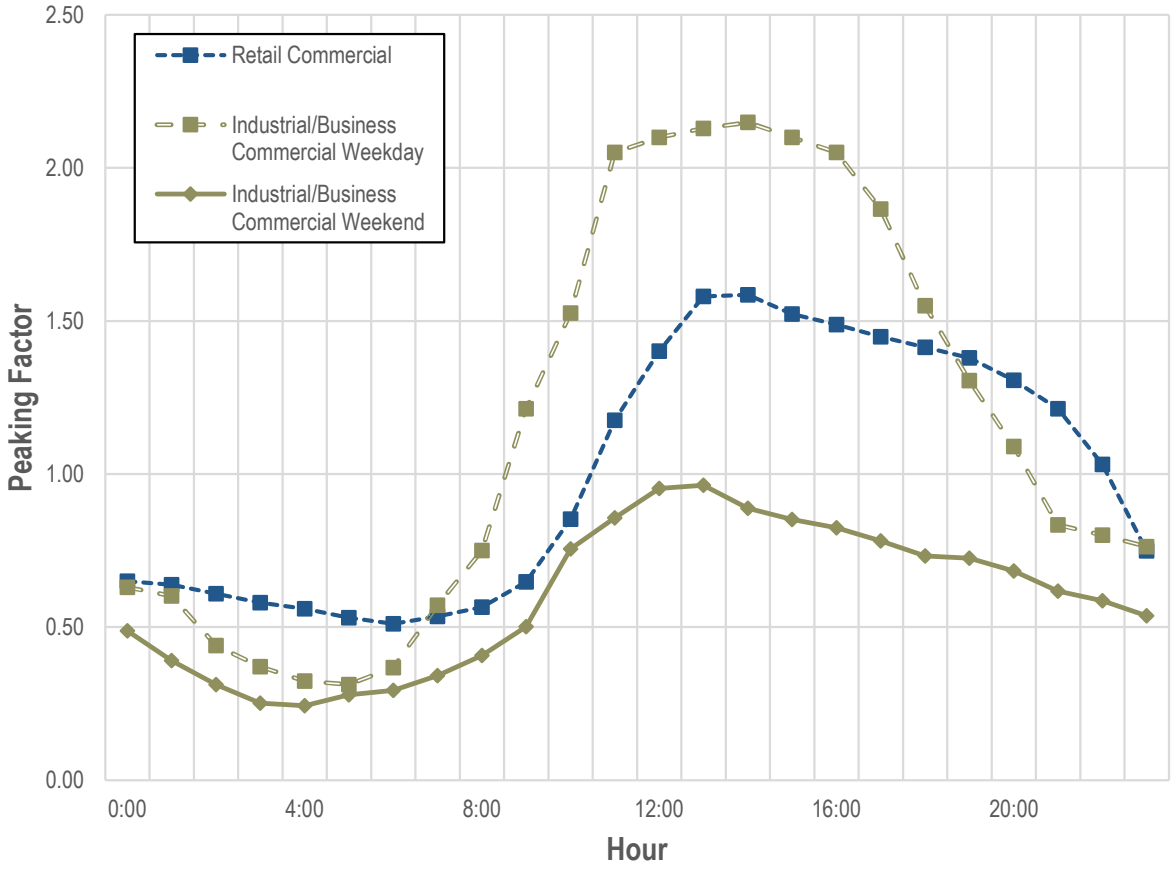


Figure 2-3: Non-Residential Diurnal Curves

2.2.2 Groundwater Infiltration

Groundwater infiltration is generally quantified based on actual flow monitoring data, since it is difficult to predict GWI rates based on physical system data alone. In the context of design flow criteria, GWI represents the incremental groundwater infiltration that occurs during the wet weather season above the "baseline" infiltration level during the driest months of the year.

GWI can be estimated based on minimum flows during non-rainfall periods within a wet weather flow monitoring period. Minimum flows typical occur during the nighttime or early morning hours when base wastewater flows are at a low. Alternatively, GWI can be estimated as the difference between average metered flow during non-rainfall periods and computed average BWF. In either case, the resulting GWI, is expressed on a unit basis (gpd/acre or gpad) by dividing by the sewered acreage of the monitored area. Typical GWI rates may range from 100 to over 1,000 gpad.

GWI flows for existing connected parcels were estimated through the model calibration process (see Chapter 3) by comparing model-simulated BWF to actual flow measurements from the temporary flow monitoring program. Cases where model-predicted BWF was noticeably lower than monitored flow indicated the possible occurrence of GWI.

2.2.3 Existing Base Wastewater Flows

Existing base wastewater flows were developed based on the assumptions summarized below; currently connected parcels are indicated in **Figure 2-4**. Note that loads are intended to represent the level of development present during the flow monitoring periods used to calibrate the hydraulic model.

2.2.3.1 City of Roseville

As noted previously, flows within City limits were estimated as part of the 2017 Sewer Model Update. As part of that study, existing residential and non-residential BWF within the City was determined based on water billing data provided by the City. The City has relatively complete water use records for all parcels within the City; billing data from December 2013 through April 2016 was provided for use in developing BWF estimates for the model. Metered water use during the winter months is assumed to most closely approximate wastewater generation, since outdoor water use is at a minimum. As data for the City of Roseville came from work done in 2016, existing BWF estimates for the City of Roseville represents 2016 land use.

December 2015 through March 2016 data was selected to represent winter water use, as it was generally wetter than prior years and therefore less irrigation was employed. This data also coincides with the flow monitoring period for the 2017 Sewer Model Update and should therefore correlate better with the recorded data during model calibration. It was assumed that all water use during these months was returned to the sewer; this assumption was validated during calibration. Note that the 2015/2016 wet season occurred after several years of drought. Therefore, water use levels may be lower than non-drought years due to conservation.

Where water use data was not available (limited portions of the City), sewer generation rates were estimated based on existing dwelling units indicated in the parcel database. For purposes of calibration, a single family rate of 160 gpd per DU and a multi-family rate of 120 gpd per DU were assumed, based on average rates from the December 2015 through March 2016 billing data. Using GIS processes, BWF loads from each parcel were then allocated to the nearest City sewer.

2.2.3.2 Placer County and SPMUD

Placer County provided spreadsheets summarizing equivalent dwelling units (EDUs) for each APN[1]. (Note: an EDU is defined as the flow equivalent of one single-family residence.) This dataset was then joined to a parcel dataset downloaded from the County website (downloaded March 20th, 2019), and then allocated to the nearest Placer County sewer. Since not all Placer County sewers are included in the model, GIS processes were used to identify the modeled manhole downstream of the parcel. All of the EDUs included in the spreadsheets were assigned to parcels and allocated to modeled manholes in this way. Each parcel was assigned either a residential or commercial loading pattern based on its general plan category as summarized in Appendix A.

SPMUD provided a shapefile[2] which provided EDUs for the year 2020 (which was identified as "existing" land use by SPMUD staff), an associated SPMUD manhole, and a type of use (residential or commercial) for each parcel. As for Placer County, GIS processes were used to identify the modeled manhole downstream of the parcel.

During calibration, a base wastewater flowrate of 160 gpd per EDU was typically applied, but this factor was adjusted down in some cases by 15 or 20 percent based on data from wastewater flow meters in the collection system.

2.2.3.3 Drought Rebound

The calibration period occurred during the third year of an ongoing drought. Billing data and flow records indicate a general decline in water use, likely due to the drought-induced conservation primarily limiting irrigation water use but also reducing indoor water use. Analysis of billing data indicates that on a per dwelling unit basis, water use was reduced by approximately 15 percent between 2014 and 2016. Therefore, for capacity analysis purposes of the existing system and for all future scenarios, it has been assumed that base wastewater flows within the City would increase by 15 percent.

For Placer County and SPMUD, BWF was increased to 180 gpd per EDU, which is consistent with the BWF assumptions used in the 2009 Systems Evaluation and is approximately a 15 percent increase compared to calibrated flow factors overall, though specific flow meter basins assume a higher rebound percentage (wherever the flowrate per EDU was decreased during calibration).

2.2.4 Future Average Dry Weather Flow

Future BWF from the City, SPMUD, and Placer County have been estimated for a Buildout scenario (representing likely future land use based on current data) as well as a Buildout-Sensitivity scenario (representing higher potential growth) using the factors summarized in **Table 2-1**. For consistency with WWTP flow projections, ADWF flow factors are used, which includes some dry season GWI.

The locations of future developments, including urban growth areas, are indicated in **Figure 2-5**, and discussed further in the next sections.

Table 2-1: Average Dry Weather Flow Factors

Land Use Designation	Units	Unit Flow Factors [a]
Commercial	gpd per acre	850
Heavy Industrial	gpd per acre	850
Light Industrial	gpd per acre	850
Mixed Use	gpd per acre	2,300
Public/Quasi-Public	gpd per acre	660
Schools	gpd per acre	170
Residential Single DU (or EDU)	gpd per du	190
Residential Mult. DU [b]	gpd per acre	2,040
Parks > 10 Acres	gpd per acre	10
Vacant/Open Space	gpd per acre	0

Notes:
a. Includes allowance for GWI.
b. The Residential Multiple DU unit flow factor can also be represented as 130 gpd per du

2.2.4.1 City of Roseville

For the City of Roseville, the Buildout scenario is based on infill of currently vacant parcels, using land use information from the City's General Plan or provided by the City's planning department, and development of the Sierra Vista, Creekview, and Amoruso UGAs. Sources of data included the following:

- Parcel data downloaded from the City's website (download dated 8/25/2016). The parcel data has the following fields that were used for to estimate future demands:
    - PotUnits: The total number of units allocated to the parcel, prior to any development. Once development beings, potential units is reduced to zero.
    - Undevunits: Once development commences, undeveloped units are the number of vacant lots in the subdivision that do not have a single family unit
    - PotArea: the total developable square footage of the parcel upon its creation. Once development begins, the area is reduced to zero.
    - UndevArea: Once development commences, if the parcel is not fully developed, the number refers to the remaining available square footage of land available to be developed
- The West Roseville Specific Plan (*West Roseville Specific Plan*, EIP Associates, dated February 4, 2004) was used to confirm future units within the West Roseville Specific Plan area.
- Land use data for several specific developments was provided by City Planning, where that data was likely to be more current and more detailed than available in the current GIS.

Infill locations are indicated in **Figure 2-5**.

2.2.4.1.1 Redevelopment (Buildout-Sensitivity Scenario)

The Buildout-Sensitivity scenario includes redevelopment of a portion of the City, as indicated in **Figure 2-5**. Redevelopment occurs where existing land uses are removed and replaced with new, typically more intensive land

uses (and associated sewer flows). Redevelopment land uses are based on parcel-based classifications developed for the 2009 Systems Evaluation. It was assumed that existing land uses for the parcels in the redevelopment area would be replaced by the land uses in the redevelopment plan. Overall, redevelopment results in an increase in ADWF of about 1.5 mgd from the Buildout Scenario. More detailed information on the redevelopment land uses inside the City is included in TM 9C of the 2009 Systems Evaluation.

2.2.4.2 Placer County and SPMUD

Placer County provided a spreadsheet that summarized the anticipated EDUs for all entitled projects in Placer County[1]. EDUs for other currently vacant parcels were estimated using general plan data[1]. Specifically, the general plan shapefile indicated a minimum and maximum density for each category; the categories used for this study, and the associated density and diurnal curve used are summarized in Appendix A. For the Buildout-Sensitivity scenario, Placer County staff suggested an assumption that 60 percent of parcels zoned for residential development would densify to 30 percent higher than the maximum density allowed in the general plan. GIS processes were used to allocate each parcel to the nearest Placer County sewer, and then associated with the modeled manhole downstream of the parcel.

The shapefile provided by SPMUD specified the EDUs in 2060 for each parcel, as well as an associated SPMUD manhole. As for assignment of existing loads, GIS processes were used to identify the modeled manhole downstream of the parcel.

Locations of future development in Placer County and SPMUD are indicated on **Figure 2-5.**

2.2.4.3 Urban Growth Areas

Several UGAs were identified in the 2009 Systems Evaluation and have been included in this evaluation. Locations of the UGAs are shown in **Figure 2-5**. Placer County UGAs include Placer Ranch, Sunset Area, Placer Vineyards, Regional University, Riolo Vineyards, and Curry Creek; the SMD-3 UGA has been incorporated into the current Service Area Boundary. UGAs within the City identified for included Sierra Vista, Creekview, and Amoruso; these UGAs either have already been added to the current Service Area Boundary or are expected to be added in early 2021 (as shown in Figure 1-1) but are included here for consistency with the City's 2017 Model Update. Land use and flow projections were based on the most recent wastewater master plans for each UGA, as indicated below. Flows associated with each UGA are summarized in **Table 2-2**. A more detailed summary of land uses for each UGA broken out by sewershed is included in Appendix B.

- Sierra Vista (*Sierra Vista Specific Plan Sanitary Sewer Master Plan*, Mackay & Somps Civil Engineers, July 2009)
- Creekview (*Creekview Specific Plan Sanitary Sewer Master Plan*, Mackay & Somps Civil Engineers, November 2010)
- Amoruso (*Amoruso Ranch Specific Plan Area Wastewater Master Plan*, Kimley Horn, September 2015)
- Placer Ranch (*Placer Ranch Sewer Master Plan,* Mackay & Somps, July 2017*)*

[1] 2018-12-18-Entitled-Planned Project.xlsx (provided December, 2018) and GeneralPlans_CommPlans.shp (downloaded from Placer County website, dated October 20, 2019)

- Placer Vineyards (*Placer Vineyards Specific Plan; Sanitary Sewer Master Plan Addendum 1,* Mackay & Somps, May 2019)
- Regional University (*Regional University Specific Plan, Sanitary Sewer Demand*, Mackay & Somps, September 1, 2017)
- Riolo Vineyards (*Riolo Vineyards Sanitary Sewer Master Plan Update*, Unico Engineering, April 2016)
- Curry Creek (*2009 SPWA Systems Evaluation*, RMC Water & Environment, 2009). No current planning information is available for Curry Creek. Preliminary land use estimates were developed for the 2009 Systems Evaluation and used again for this evaluation.
- Placer UGA (*Hawk Homestead Sewer Analysis – Supplementary Information Requested by Placer County Environmental Engineering,* Derrick Whitehead, Municipal Consulting Group, January 29, 2016)

Table 2-2: ADWF from UGAs

UGA	Agency	WWTP	Total Area (ac)	Buildout ADWF (mgd)
Sierra Vista	Roseville	Pleasant Grove	2,064	1.83
Creekview	Roseville	Pleasant Grove	501	0.43
Amoruso[a]	Roseville	Pleasant Grove	694	0.61
Placer Ranch	Placer County	Pleasant Grove	2,213	2.15
Sunset Area[b]	Placer County	Pleasant Grove	2,888	3.80
Placer Vineyards	Placer County	Dry Creek	5,230	2.89
Regional University	Placer County	Pleasant Grove	1,159	1.17
Riolo Vineyards	Placer County	Pleasant Grove	879	0.23
Curry Creek	Placer County	Pleasant Grove	3,212	2.74
Placer UGA	Placer County	Pleasant Grove	617	0.04

Notes:
a. Includes 274 units north of Amoruso that would contribute flow through sewers in Amoruso (Toad Hill)
b. Does not include the Placer Ranch subset of the Sunset Area Plan

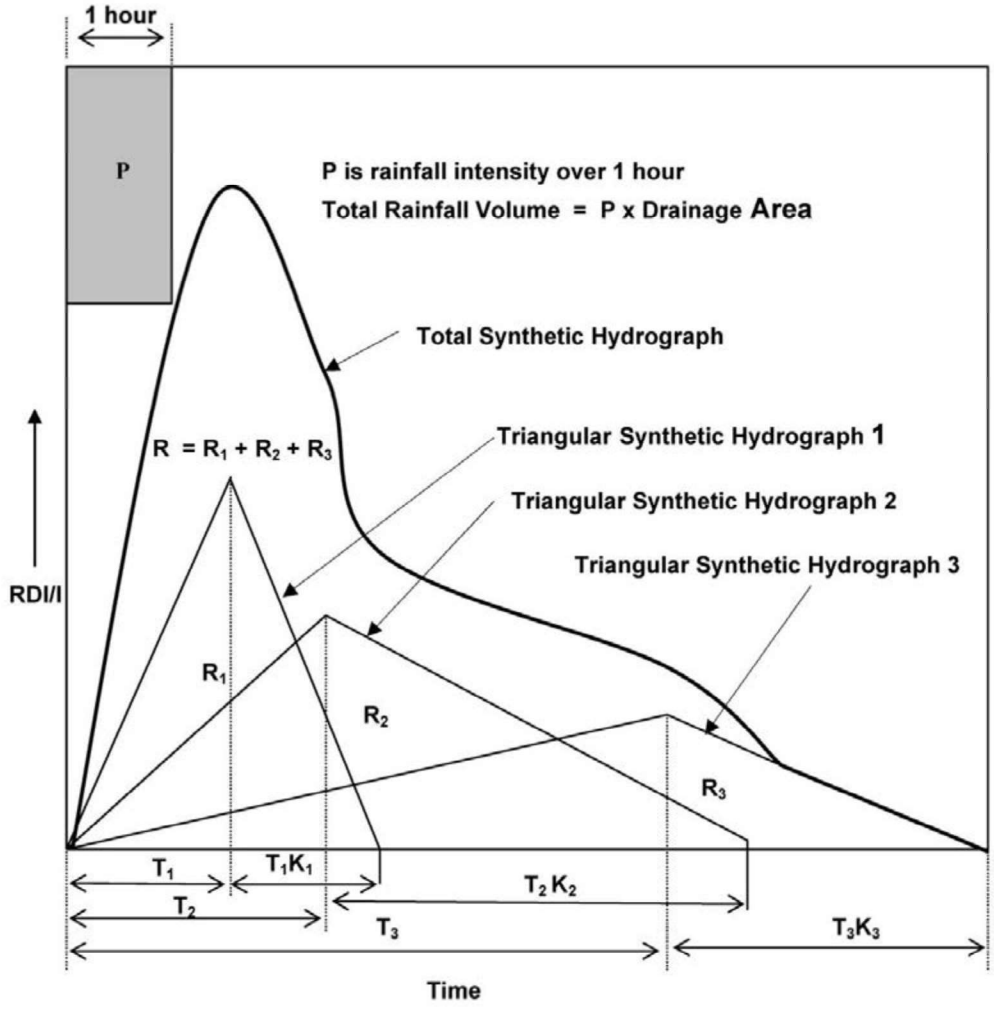
2.2.5 Dry Weather Flow Summary

Existing and Projected Future Dry Weather Flows are summarized in **Table 2-3**. Note that these estimates include wet season GWI, which may be higher than dry season GWI.

Table 2-3: Estimated Dry Weather Flows[a] by Agency

WWTP	Agency	Existing Calibration ADWF (mgd)	Existing ADWF with Drought Rebound	Buildout ADWF (mgd)	Buildout-Sensitivity[b] ADWF (mgd)
Pleasant Grove	Roseville	5.87	6.70	13.01	13.04
	Placer County	0.18	0.20	9.85	9.85
	SPMUD	2.25	2.97	3.63	3.63
	Total	**8.30**	**9.87**	**26.49**	**26.52**
Dry Creek	Roseville	5.60	6.27	6.89	8.23
	Placer County	2.57	2.81	7.19	7.42
	SPMUD	2.90	3.64	5.16	5.16
	Total	**11.06**	**12.72**	**19.24**	**20.81**

Notes:



a. Includes wet season GWI.

b. For the Buildout-Sensitivity scenario, the development density was assumed to be at the maximum range allowed by the General Plan. A Base Wastewater Flowrate (BWF) of 180 gpd per EDU was assumed for Placer County and SPMUD.

2.3 Rainfall-Dependent Infiltration and Inflow

RDI/I flows result from rainfall events that produce infiltration and inflow of storm water runoff into the sewer system. RDI/I flows are defined by the magnitude, shape, and timing of the RDI/I response. RDI/I varies depending on many factors, including the magnitude and intensity of the storm event, area topography, type of soil, and the condition of the sewers, manholes, and sewer service laterals. In a dynamic model, RDI/I is typically computed as a percentage of the rainfall (sometimes referred to as the "R value") falling on the contributing area of a subcatchment for each of three or more hydrograph components, representing different response times to rainfall, e.g., fast, medium, and slow, as illustrated in **Figure 2-6**. The contributing area is assumed to be the sum of the area of all developed parcels, except for large open areas such as parks and parking lots. Summing all of the component hydrographs for the entire duration of the rainfall event results in the total RDI/I hydrograph for the event for that subcatchment. Note that although the "slow" RDI/I component can contribute significantly to the total RDI/I volume, the "fast" component has the biggest impact on the magnitude of the peak wet weather flow.

Figure 2-6: RDI/I Hydrograph Components

3. TRUNK SEWER EVALUATION

3.1 Introduction

This section describes the hydraulic analysis and design criteria used to evaluate system performance and size capacity relief projects in the trunk sewer system and identifies the capacity deficiencies based on the results of model runs.

3.2 Model Network Development

This section describes the development of the hydraulic model used for the capacity assessment of the SPWA trunk sewers. The modeling software used for this study was InfoWorks ICM by Innovyze, a fully dynamic hydraulic modeling program that has been used for many other collection systems in California, including Sacramento Area Sewer District, Regional San, and the City of Folsom. This section provides an overview of the model development process, including description of the modeled sewer network, the flow monitoring program, and the calibration of the model.

3.2.1 Modeling Terminology

Key modeling terms are defined below.

- **Network** refers to the representation of the physical facilities being modeled. Modeled network components include pipes, manholes, and pump stations.
- **Nodes** are primarily manholes, but also include pump station wet wells and outfalls (discharge points from the modeled system). Key data associated with nodes include manhole ground elevations and pump station wet well elevations and cross-sectional areas.
- **Pipes** or **conduits** are connections (links) between nodes, and include both gravity sewers, force mains and conduits. Key data associated with pipes are upstream and downstream node IDs, pipe length, diameter, roughness factor, and upstream and downstream invert elevations.
- **Pumps, gates, and overflow weirs** are represented in the model as links between nodes. Data associated with these facilities depend on the structure type. For example, data for weirs include width, elevation, and weir discharge coefficient.
- **Subcatchments** are areas that contribute flow to the modeled sewer network. They may represent parcels, or an area comprised of multiple parcels that are collected by unmodeled sewers in the collection system (sewershed). Data associated with subcatchments include BWF (computed based on population, water use, or other available data), type of diurnal BWF profile (which is a function of land use), I/I parameters, and the node at which the flow from the subcatchment enters the modeled system.
- **Model loads** are the flows entering the modeled sewer system from each subcatchment. Model loads include residential and commercial sanitary or BWF, GWI, and RDI/I. As a sum, they represent the total wastewater flow applied to the model.
- **Models** are the combination of a modeled network, its associated subcatchments and loads, and other data (e.g., rainfall, diurnal profiles, inflows from other areas, etc.) that comprise a specific model scenario.

3.2.2 Modeled System

The model network for this Systems Evaluation included trunk sewers from the City's model, as well as selected pipe reaches in SPMUD and Placer County. The extent of the modeled sewers in SPMUD and Placer County is consistent with the extent used in the 2009 Systems Evaluation, and generally includes 15-inch and larger trunk sewers. The existing modeled network is shown in **Figure 3-1**. **Figure 3-1** also highlights the trunk sewers within Roseville that convey flow from multiple SPWA partners and are the focus of the capacity analysis.

As noted previously, the model network was based on the model developed for the City's 2017 Sewer Model Update. For the trunk sewers in that model update, the City's GIS data was updated with rim and invert elevation data extracted from record drawings or, in some cases, ground elevation data from other datasets. In a few cases (e.g. at all flow splits) additional data was collected through survey or field inspection by City staff.

For the current Systems Evaluation Update, that model was extended into Placer County and SPMUD service areas to provide a more complete analysis of the regional trunk sewer system. GIS data provided by Placer County and SPMUD was used as the basis for extending the network into their respective systems. The model extent was limited to the extent used for the 2009 Systems Evaluation, but generally includes most 15-inch and larger sewers, as well as selected smaller diameter sewers. A model validation process was undertaken, similar to the process used in the City's 2017 Sewer Model Update.

Model validation generally includes the following:

- **Connectivity checks.** The modeled networks were checked for connectivity, which includes verifying that correct upstream/downstream manholes were identified for each pipe, with no missing links or nodes in the network. A connected network means that all pipes and manholes will be selected when the network is traced upstream from the model outfalls.
- **Missing data checks.** Key data required for modeling were reviewed to identify missing values. Missing data were inferred where reasonable (e.g., where one or two invert elevations were missing between populated values, the data could be interpolated), or populated based on data from the 2009 Systems Evaluation.
- **Profile review.** Profiles were plotted for each series of pipe segments in the modeled network to visually check for suspect data. Examples of suspect data include negative pipe slopes, abrupt steps up or down in pipe inverts, and pipe diameters that conflict with surrounding pipes. Where appropriate, corrections to suspect data were inferred. Otherwise, verification in the form of as-built drawings or field investigations were requested.
- **Special structures.** Flow splits (manholes with more than one outlet pipe) were identified for further verification of outlet pipe elevations and/or the existence of weir overflows or other control structures. Field verification and/or as-built drawings were requested as needed.

In all, the model includes approximately 83 miles of gravity trunk sewers, of which about 32 miles are considered SPWA facilities. All gravity pipelines are modeled assuming a Manning's n of 0.013.

The modeled system includes two pump stations that can convey regional flows as summarized in **Table 3-1**. PS 25 and PS 26 were designed to operate during high wet weather conditions by transferring flow between trunk sewers, thereby alleviating downstream capacity issues. Flow enters the pump station wet well when surcharge conditions in the adjacent gravity sewer overtops an associated weir. PS 25 is designed to limit surcharging in the trunk sewer on Old Auburn Road and conveys flows (mostly originating in Placer County) north towards the 21-inch trunk sewer downstream of Placer County's Sierra College Meter. PS 26 is designed to limit surcharging in that 21-inch easement sewer by conveying flows further north on East Roseville Parkway. City operations staff note that PS 26 is used regularly during wet weather conditions, but PS 25 has not been used in a number of years.

Table 3-1: Regional Pump Station Facilities

Pump Station	No. of Pumps	Firm Capacity[a] (mgd)	Total Capacity (mgd)	Force Main Dia. (in.)
PS 25[b] (Johnson Ranch)	2	2.02	3.20	12
PS 26 (Old Auburn)	2	0.43	0.68	8

Notes:

a. Capacity with one pump out of service.
b. Capacity of PS 25 is based on information collected as part of the 2009 Systems Evaluation. Capacity has not been evaluated for this study. Based on reports from City operations, PS 26 has not been used in several years.

3.2.3 Flow Monitoring Program

To support the development of the hydraulic model and flow projections for the Systems Evaluation Update, a temporary flow monitoring program was conducted as part of this study, including 30 meters during the 2015/2016 wet weather season (for the City's 2017 Model Update) and 12 meters during the 2018/2019 wet weather season (for SPMUD and Placer County). V&A Consulting Engineers, under subcontract to Woodard & Curran, conducted the monitoring. The meters and rain gauges were installed for a 2-month period from early January through early March for each wet weather season to capture the flow from the tributary areas. In addition, two recording rain gauges were also installed during both seasons and used for calibration of gauge-adjusted radar rainfall data. The locations of the flow monitoring sites are shown in **Figure 3-2.** The figure also shows the associated tributary area (basin) for each flow meter.

The locations of the flow meters relative to each other and to flow splits within the collection system are shown schematically in **Figure 3-3**. Note that many of the meters were located downstream of other meters; therefore, the tributary areas shown for each of these meters in **Figure 3-2** are the "incremental" areas between the flow meter and tributary basins of the upstream flow meters. Flow meter locations, pipe diameters, and upstream meters are listed in **Table 3-2** and **Table 3-3** for the permanent meters and temporary meters, respectively. Data for all meters during both flow monitoring periods are included in Appendix C.

The purpose of the flow monitoring program was to quantify the flows in the system to provide data with which to calibrate the hydraulic model (discussed later in this section), and to quantify the I/I response to storm events in various areas of the system.

Figure 3-3: Flow Meter Schematic

3.2.3.1 Radar Rainfall Data

To obtain the most accurate spatial rainfall data for use in model calibration, gauge-adjusted radar rainfall (GARR) data was obtained for the rainfall events that occurred during both monitoring periods. GARR data combines the use of spatial rainfall estimates from radar data with point rainfall measurements from rain gauges located on the ground. The radar measures the reflected signals from falling raindrops in the atmosphere, which can then be translated into estimates of rainfall rates using mathematical and empirical relationships. However, the conversion of the reflected signals to rainfall rates is not sufficiently accurate to consistently estimate actual rainfall amounts at a given location, but does provide good information about the relative rainfall amounts at different locations (i.e., the spatial variation of rainfall). Therefore, the radar rainfall estimates are calibrated to (i.e., adjusted to match) more accurate rainfall measurements from rain gauges located on the ground in the area of study.

The process of converting radar images to GARR estimates is complex and must be conducted by trained and experienced radar rainfall specialists. There are several providers of GARR data throughout U.S. Each uses its own data processing techniques and proprietary algorithms to generate the gauge-adjusted radar rainfall estimates. For this study, Woodard & Curran contracted with OneRain, Inc. to provide the GARR data. The rainfall collected by the two V&A temporary rain gauges was provided to OneRain for use in their GARR calibration to supplement data available from permanent rain gauges owned by the City for its Flood Alert System.

OneRain developed the GARR data for the flow monitoring period in 5-minute time increments for 1 kilometer by 1 kilometer pixels (each approximately 250 acres in size) covering the entire SPWA service area (including SPMUD and Placer County). Approximately 200 pixels cover the sewered portions of the service area. The data was aggregated to 15-minute intervals for use in the model. The pixel containing the centroid of each model subcatchment defines the rainfall for that subcatchment for each rainfall event.

3.2.4 Model Loading

Section 4.4 described how BWF model loads were developed from water use and land use and growth projections. GWI and RDI/I flows were also loaded to the model by parcel by associating each parcel with a flow meter area. For each parcel, a sewershed ("contributing") area (i.e., area that potentially contributes I/I) was determined based on land use. Contributing areas for non-open space land uses, including residential, commercial, industrial, and institutional uses, were based on the full parcel area. Contributing areas for parks and other land uses that may contribute sewer flows but are likely to have significant open space were limited to 1 acre. Parcels comprised of open space, drainage channels, and large roadways such as freeways not likely to contribute sewer flows were assigned zero contributing area. I/I flows for each parcel were computed in the model by applying the appropriate meter area GWI and RDI/I parameters (determined during the model calibration process described below) to the contributing area of the parcel.

Parcels loading to the same modeled manhole are grouped into subcatchments. All BWF loads associated with each parcel in the subcatchment are then summed to calculate the overall BWF loading from the subcatchment. The contributing areas are also summed, and the appropriate meter area GWI and RDI/I parameters are assigned to calculate I/I flows for each subcatchment.

3.2.5 Model Calibration

Model calibration is the process of comparing model-computed flows to observed (monitored) flows to verify that the model is accurately simulating flows in the sewer system. The model is calibrated for both dry and wet weather conditions.

As described above, temporary flow monitoring programs were conducted during the late January through mid-March 2016 and 2018 wet weather periods. The data collected during these flow monitoring programs, as well as data from the permanent meters, were used for model calibration.

3.2.6 Dry Weather Calibration

The dry period in early to mid-February 2016 (for flow meters in the City) and late January 2019 (for flow meters in SPMUD and Placer County) were used as the dry weather calibration periods for the model. The dry weather calibration process was used to verify BWF loads and diurnal curves, and to quantify GWI (as indicated by monitored flows that were higher than estimated BWF). The dry period immediately prior to the wet weather calibration period in early March was also used to confirm the calibration.

Figure 3-4 shows an example plot of model vs. metered flow for one meter location (Site 155). In this graph, the green line represents the monitored (observed) flow, and the red line is the model-simulated flow. Calibration graphs for all meters throughout the monitoring program are included in Appendix D. Note that the Sierra College permanent meter was not operational during much of the 2019 season; however, nearly all tributary flows to this meter were measured as part of the temporary metering program. While most meters calibrated well for both 2016 and 2019 data, there were a few meters with discrepancies. The discrepancies are mostly due to differences in GWI observed in the temporary meters upstream of the Springview and Sierra College meters during the 2019 flow monitoring program versus the 2016 program. As 2016 had significantly less rainfall preceding the flow monitoring program, this GWI was likely not present during the 2016 flow monitoring program.

Table 3-4 summarizes the dry weather loading parameters determined for each flowmeter area during calibration. Calibrated unit flow factors are indicated on **Figure 3-5**, while estimated GWI rates for each flowmeter area are indicated on **Figure 3-6.**

The model calibration resulted in a reasonably good match of modeled to metered flow at most locations, but some differences at others. These differences may be due to inaccuracies in the meter data, inaccuracies in the water consumption data, or in the configuration of the system (e.g., upstream flow splits). The calibration process also resulted in further investigation and adjustments at the major flow split locations in the model (manholes SMH B06-169, SMH A08-156, SMH B07-405 and SMH D04-442). To ensure accuracy during calibration, sewers in the City's trunk model were updated based on survey, field investigation and City drawings to capture the physical structures of the flow splits and then adjusted as needed to better calibrate to the flow meter data.

For a few of the meters (FM 6, 10, and 16A), the water consumption data was not sufficient to account for all of the apparent flow observed by the flowmeter. This could be due to water use not in the water consumption database (e.g. water from another source, or error in the water consumption database), or an error in the flow meter data. To be conservative, some residential flow (less than 0.1 mgd) was distributed in each of the meter areas across all parcels to improve calibration.

3.3 Wet Weather Flow Projections

3.3.1 Wet Weather Calibration

During wet weather calibration, parameters are adjusted to simulate the volume and timing of RDI/I for monitored storm events. Rainfall was assigned to each parcel or subcatchment using data from the GARR pixel at the centroid of the parcel or subcatchment. Through the wet weather calibration process, RDI/I hydrograph parameters were developed for each metered area. For calibration of the City's meters, the rainfall period from March 4th through March 15th, 2016 was used to determine RDI/I parameters. This period had two storms: the first storm occurring around March 5th-6th generally had the highest rainfall totals; the second storm on March 12th-13th generally had the highest peak flows. The soils for the second storm were more saturated, and generated a larger response. For a conservative calibration, RDI/I parameters were selected to best match the response to the March 12th-13th storm. These conservative calibration conditions should be considered when using this model to evaluate capacity.

For meters in Placer County and SPMUD, two storms were used for wet weather calibration: one event occurring January 15th through January 17th, and another event February 25th through 27th, 2019. The January event was generally higher peak intensity but lower total volume, while the February event was less intense but had more total rain. Both events had similar (generally wet) antecedent conditions. Some meters had higher peak flows during the January event, while others had higher peak flows during the February event; in general, an attempt was made to calibrate for both events. Storm information for the calibration events are summarized in **Table 3-5**.

Table 3-5: Calibration Rainfall Events

Start Date/Time	Storm Duration (hours)	Total Storm Rainfall (in.)			Peak Hour (in.)

Table 3-6 summarizes the results of the wet weather calibration in terms of the R values assigned to each flow meter basin. An example wet weather calibration graph is presented in **Figure 3-7**. Calibration graphs for all meters are included in Appendix D.

Overall, most meters had relatively low R values, indicative of a tight system with newer pipes (see **Figure 3-8)**. The FM 5 and FM 7 areas exhibited more significant peak flow response. Further investigations, such as smoke tests or CCTV, may be appropriate in these area or others with higher R factors to identify potential sources of I/I (such as unauthorized stormwater discharge or leaking pipes or manholes) and any capacity concerns.

A few areas did not exhibit enough response to rainfall to develop calibration parameters; a minimum R volume response of 0.6 percent was assumed, distributed evenly between the fast, medium, and slow response R factors. For future growth areas, a minimum R volume response of 0.6 percent was also assumed, which results in a peak RDI/I under the design storm of approximately 700 gallons per acre per day (consistent with criteria for new development documented in TM 3A of the 2009 Systems Evaluation).

Table 3-6: Wet Weather Calibration Parameters

Flow Meter ID (FM ID)	R1 RDI/I Vol (%)	R2 RDI/I Vol (%)	R3 RDI/I Vol (%)	Rtot RDI/I Vol (%)

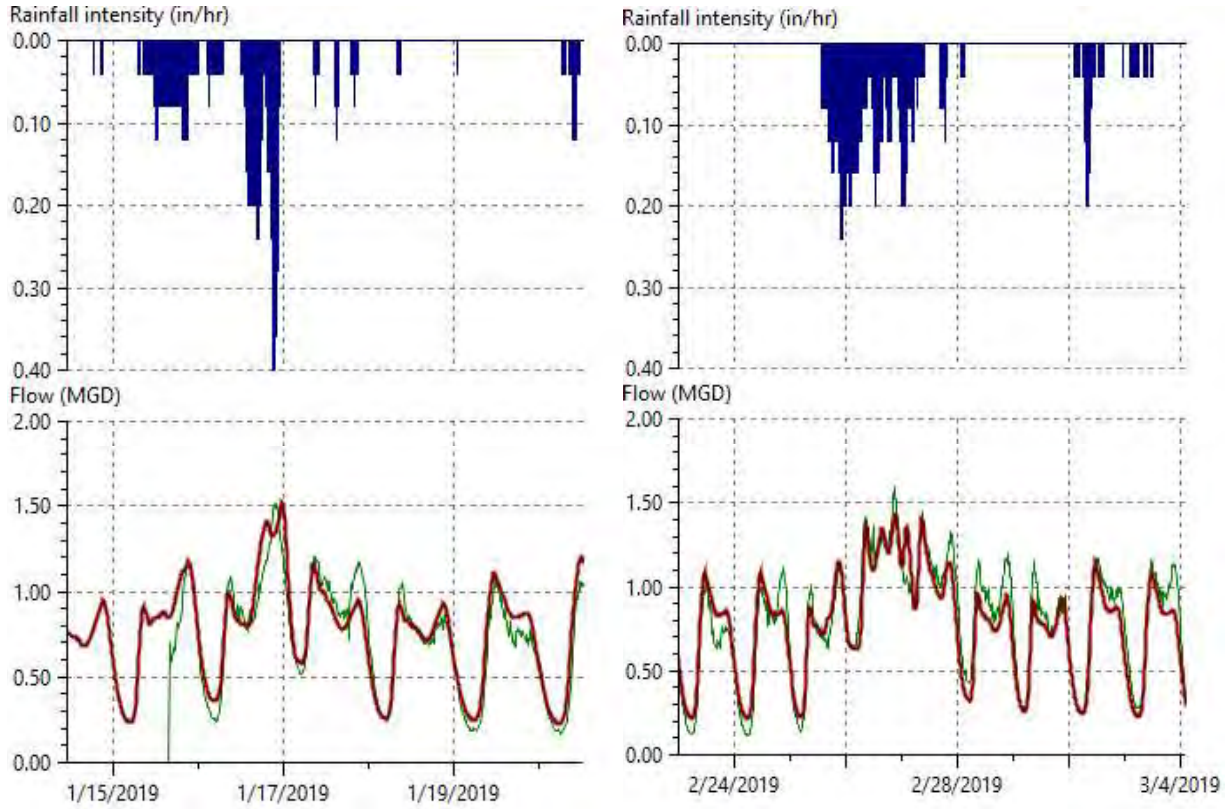
156	1.0	1.3	2.0	4.3
157	0.7	0.4	0.4	1.5



Flow Meter ID (FM ID)	R1 RDI/I Vol (%)	R2 RDI/I Vol (%)	R3 RDI/I Vol (%)	Rtot RDI/I Vol (%)
158	0.3	1.1	3.0	4.4
159	0.2	0.5	1.3	2.0
160	0.9	1.3	2.5	4.7
161	0.6	1.0	2.0	3.6
162	0.2	0.5	1.3	2.0
Cincinnati[b]	0.1	0.1	1.3	1.5
Industrial[b]	0.1	0.1	0.3	0.5
SMD-2	0.6	1.0	2.0	3.6
Sierra College	0.5	0.9	1.9	3.3
Highlands	0.7	1.0	0.4	2.1
North Roseville (Pleasant Grove)	1.3	1.3	0.3	2.9
Springview (Dry Creek)	0.7	2.0	10.0	12.7

Notes:

a. Where flowmeters did not indicate a significant response to rainfall, a minimum response of 0.6% was assumed, disbributed evenly between R1, R2, and R3. A minimum response of 0.6% was also assumed for areas of future growth.

b. Due to highly variable and relatively low industrial flows, calibration of Cincinnati and Industrial meters was limited.

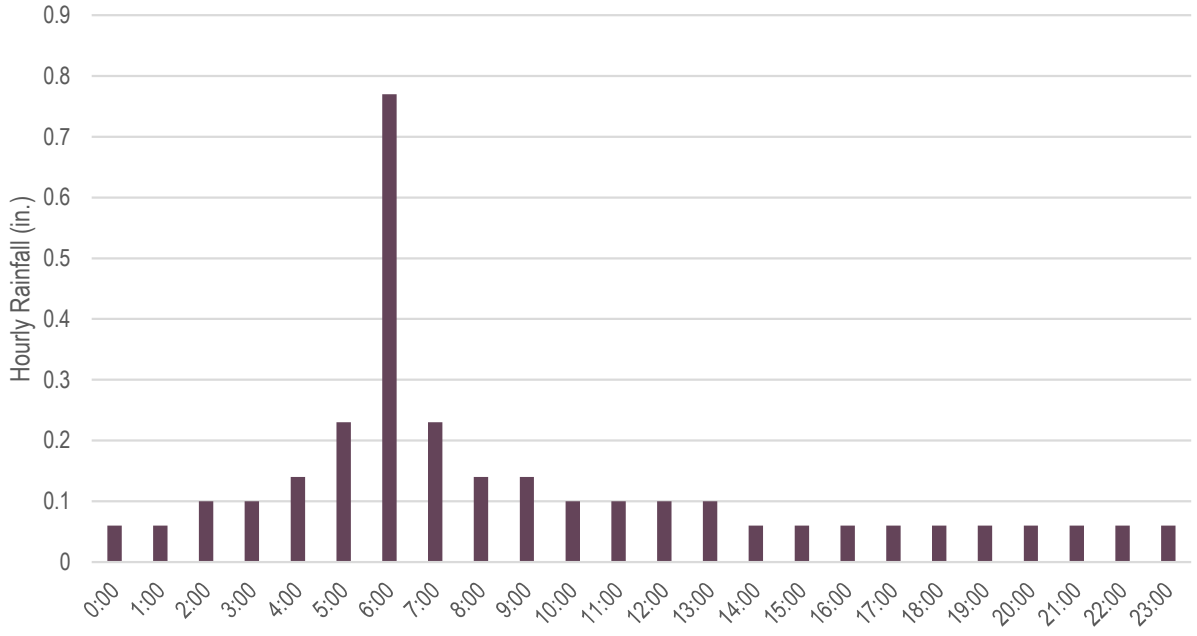
3.4 Capacity Analysis

This section describes the hydraulic analysis and capacity criteria used to evaluate system performance and size capacity relief projects in the trunk sewer system, and identifies the capacity deficiencies based on the results of model runs.



3.4.1 Design Flow Criteria

Design flows for sewer systems consist of BWF, GWI, and RDI/I. Criteria for computing existing BWF, GWI, and RDI/I (developed as part of model calibration), and flow assumptions for future development were discussed in the previous chapters. Note that for capacity analysis purposes, base wastewater flows assume rebound of approximately 15 percent from current flows.

For this Systems Evaluation Update, design RDI/I is based on a 10-year 24-hour synthetic rainfall pattern that occurs uniformly across the entire service area. The event used is the same event as used for the previous 2009 Systems Evaluation. The design storm hyetograph was developed utilizing Table 5-A-1 (elevation (h) = 150 feet) from the 1990 Placer County Flood Control and Water Conservation District Stormwater Management Manual (1990 Placer County Stormwater Management Manual). This event has a 1 hour peak intensity of 0.77 inches and a 24-hour rainfall depth of 2.97 inches. The peak rainfall hour was set at 6 a.m. so that the peak RDI/I response (which would normally occur about 1-2 hours after the rainfall for a typical basin) roughly coincides with the peak hour of the dry weather profiles to give a conservative flow response in the collection system. The intensity and timing of the design storm is presented in **Figure 3-9**.

It should be noted that current NOAA statistics (NOAA Atlas 14, updated in 2014) have a somewhat lower peak hour rainfall intensity, though slightly higher 24-hour rainfall depth (1 hour peak intensity of 0.65 and 24-hour depth of 3.35 inches). As the design event developed from the 1990 Placer County Stormwater Management Manual was likely to result in higher peak flows, and therefore more conservative estimate of system capacity, that design event was selected for this evaluation. NOAA Atlas 14 data confirms that design rainfall intensity does not vary significantly across the SPWA service area.

Figure 3-9: SPWA 10-year Design Storm Event

3.4.1.1 Summary of Flows Under Design Storm

A summary of modeled flows based on the design flow criteria is included in **Table 3-7.**

Table 3-7: Modeled ADWF and Peak Wet Weather Flow Summary

	Existing (Rebound)			Buildout			Buildout-Sensitivity		
WWTP	BWF[a] (mgd)	ADWF (mgd)	PWWF[b] (mgd)	BWF[a] (mgd)	ADWF (mgd)	PWWF[b] (mgd)	BWF[a]	ADWF (mgd)	PWWF[b] (mgd)
Pleasant Grove	9.5	9.9	27.4	26.1	26.5	55.8	26.2	26.5	56.0
Dry Creek	10.1	12.7	41.9	16.7	19.2	59.2	18.2	20.8	60.6

Notes:
a. Does not include wet season groundwater infiltration (GWI).
b. Modeled PWWF assumes improvements have been implemented to eliminate overflows and significant surcharging.

3.4.2 Hydraulic Capacity Criteria

Capacity deficiency or performance criteria are used to determine when the capacity of a sewer pipeline is exceeded to the extent that a capacity improvement project (e.g., a relief sewer or larger replacement sewer) is required. Capacity deficiency criteria are sometimes called "trigger" criteria in that they trigger the need for a capacity improvement project. These criteria may differ from "design criteria" that are applied to determine the size of a new facility, which may be more conservative than the performance criteria. The 2009 Systems Evaluation identified several hydraulic capacity criteria:

- No surcharging in SPWA sewers, though exceptions were made where limited surcharging may occur in relatively deep pipes. Note that surcharging due to downstream conditions (i.e. backwater conditions) may not be considered a deficiency.
- Pump stations are considered capacity deficient if the design storm PWWF exceeds the pump station capacity with the largest pumping unit out of service (i.e. firm capacity).
- Force mains with velocities exceeding 7 feet per second under PWWF may require further investigation, though would not trigger a project unless the pump station required additional capacity.

As the current model is a calibrated fully-dynamic model, the design condition represents a relatively infrequent storm event, and many of SPWA's sewers are relatively deep, a less conservative surcharge criteria was applied, with surcharging up to within 5 feet of the manhole rims (ground surface) considered acceptable under 10-year design storm PWWF, as long as the surcharge (flow height in the manhole) does not exceed 4 feet from the top of pipe up the manhole. The pump station and force main criteria from the 2009 Systems Evaluation were unchanged.

3.4.3 Capacity Analysis Results

The calibrated model was run for Existing, Buildout, and Buildout-Sensitive land use scenarios under the design event described above. Several deficiencies were identified in non-regional facilities which resulted in model-predicted overflows for one or more of the scenarios; to ensure flows were conveyed to regional sewers, pipes were upsized in this analysis to eliminate any overflows.

Within the regional system, seven areas have been identified that either have deficiencies or could be impacted when upstream deficiencies are relieved. Note that not all areas have been identified as having capacity deficiencies.

- **Area A** includes the sewers on Old Auburn Road immediately downstream and upstream of PS 26. This area is designed to divert flows above the springline of the sewer into PS 26. However, since PS 26 has insufficient firm capacity during peak wet weather flows, the sewers back up into the upstream sewers and results in a modeled overflow. This is an area of known capacity concerns. If flows through PS 26 were increased, the capacity issues in this area would be relieved.

- **Area B** includes the trunk sewer downstream of Area A from Old Auburn Road to SMH A06-257, which is where flow from PS 26 rejoins this trunk sewer. Note that there are two shallow manholes in this area that have less than 5 feet of cover (SMH A07-234 and SMH A07-091). Sewer depths should be investigated, and, if depths are confirmed, bolting manhole covers should be considered.

- **Area C** includes the trunk sewer downstream of Area B (from SMH A06-257) to the junction structure at Oak Ridge Drive. The junction structure at Oak Ridge Drive connects a 15-inch trunk (modeled, but not part of the regional system) to the main 33-inch trunk, but allows high flows to overtop a weir into a parallel 15-inch trunk sewer.

- **Area D** includes the 30-inch and 33-inch trunk sewer downstream of the Area C (from Oak Ridge Drive), to the 42-inch sewer near Riverside Age.

- **Area E** includes the 15 and 21-inch sewers from the Sierra College permanent meter to the weir structure adjacent to PS 25.

- **Area F** includes the area downstream of Area E, extending from PS 25 to the upstream manhole of Area C (SMH A06-257).

- **Area G** includes the gravity sewer downstream of PS 26, extending to the intersection with Area E.

Model results under Existing and Buildout conditions are summarized in **Table 3-8** and shown in **Figure 3-10** and **Figure 3-11**, respectively. The figures indicate existing trunk sewers that were predicted by the model to be surcharged (water levels in manholes above the crowns of the pipes) due to "throttle" conditions (peak flow exceeding full pipe capacity) or due to backwater from a downstream throttle condition, and locations of model-predicted overflows. Note that **Figure 3-11** shows the results for both the Buildout and Buildout-Sensitivity scenarios (i.e. there is no difference in surcharge locations between the scenarios). In **Table 3-8**, areas that exceed the hydraulic capacity criteria but do not have modeled overflows are highlighted yellow, while areas with modeled overflows are highlighted orange. Hydraulic profiles for each area under existing and Buildout land use conditions are included in Appendix E.

Table 3-8: Capacity Results under Existing and Buildout Land Use Scenarios[a]

Area	Existing (with Rebound)			Buildout and Buildout-Sensitivity		
	Length of Throttle Surcharge (ft)	Maximum Surcharge Depth (ft)	Minimum Freeboard (ft)	Length of Throttle Surcharge (ft)	Maximum Surcharge Depth (ft)	Minimum Freeboard (ft)
A	5,530	7.3	0.0	5,530	7.8	0.0

3.5 Proposed Improvements

Proposed improvement projects have been developed, and verified using the hydraulic model, to alleviate surcharge in the areas described in the previous section. Each proposed project was reviewed on aerial mapping to identify potential design and constructability issues. Preliminary estimates of probable construction costs were prepared.

This section discusses these proposed improvements as well as the criteria used to develop them and estimate costs. The projects are considered planning level, and further pre-design of each project is recommended prior to implementation.

3.5.1 Design Criteria for New Sewer Facilities

Section 9 of the City of Roseville Design Standards (January 2019) details criteria for Sanitary Sewer Design. These criteria are used during the development of new standards and applied to any new infrastructure.

3.5.1.1 Gravity Sewers

Below is a list of select City design standards for gravity sewers. See Section 9 of the Design Standards for a full listing of criteria.

- Minimum slopes and flow capacities summarized below

Pipe Diameter (in)	Slope (ft/ft)	Capacity (at 0.7 Depth)	Capacity Flowing Full
6	0.0050	0.22 MGD	
8	0.0035	0.38 MGD	
10	0.0025	0.58 MGD	
12	0.0020	0.85 MGD	1.00 MGD
15	0.0015	1.32 MGD	1.60 MGD
18	0.0012	1.95 MGD	2.35 MGD

- Maximum allowable depth-to-diameter ratio (d/D) of 0.7 at design flow for laterals 10 inches or less. Pipes 12" or greater may be designed to flow full unless connections are planned, in which case the 0.7 depth-to-diameter ratio governs.
- Flow velocities must be between 2 feet per second and 10 feet per second.
- Maximum bury depth of main with lateral connection shall be 15 feet. Minimum slope of lateral connection shall be ¼ inch per foot with a minimum bury depth of 12 inches at any buildable location within the properties to be served.
- Maximum spacing of manholes shall be 500 feet for all straight lines of 10 inches in diameter or less. Manhole spacing for mains 12 inches and larger shall be considered on a case by case basis.
- The invert elevation for pipe of the same diameter entering a manhole shall have a 0.10-foot drop between the entering and exiting pipe and invert elevations for pipe of different diameters shall match crown of exiting pipe. The crown of the entering pipe shall be at the same elevation or higher than the exit pipe.
- Drop connections shall be permitted under special conditions and with the approval of the Environmental Utilities Director

3.5.1.2 Pump Stations and Force Mains

Below is a list of select City design standards for pump stations and force mains. See Section 9 of the Design Standards for a full listing of criteria.

- A sufficient number of centrifugal pumping units shall be installed such that station capacity can be maintained with any one unit out of service.
- Provisions for 4 hour storage capacity shall be provided.
- Planning level criteria as follows:

Pump Stations	
Capacity	PWWF (hydraulic modeling required for pipes 18 inches and larger)
Storage	4 hours
Operation	Lead/lag for duty pump(s), plus 1 standby pump
Maximum Pump Cycles	6 cycles/hour (3 cycles per pump)
Force Mains	
Headloss	Hazen-Williams roughness coefficient (C-factor) of 120
Maximum Velocity	7-10 feet per second
Minimum Velocity	3.0 feet per second

3.5.2 Cost Criteria

Opinions of probable costs for proposed capacity improvement projects were developed based on Woodard & Curran's experience with similar projects and discussions with product vendors. The estimated construction costs are based on a Class 4 estimate as defined by the Association for the Advancement of Cost Engineering (AACE) International cost estimate classification system. **Table 3-9** provides a summary of the estimate classes and expected accuracy range. For Class 4 estimates, the expected accuracy range is -15% to -30% on the low end and +20% to +50% on the high end.

Table 3-9: Cost Estimate Classification Matrix (AACE International)

Estimate Class	Level of Project Definition	Purpose of Estimate	Methodology	Expected Accuracy Range
Class 5	0% to 2%	Concept screening	Capacity factored, parametric models, judgement, or analogy	Low: -20% to -50% High: +30% to +100%
Class 4	1% to 15%	Study or feasibility	Equipment factored or parametric models	Low: -15% to -30% High: +20% to +50%
Class 3	10% to 40%	Budget authorization or control	Semi-detailed unit costs with assembly level line items	Low: -10% to -20% High: +10% to +30%
Class 2	30% to 75%	Control or bid/tender	Detailed unit cost with forced detailed take-off	Low: -5% to -15% High: +5% to +20%
Class 1	65% to 100%	Check estimate or bid/tender	Detailed unit cost with detailed take-cost	Low: -3% to -10% High: +3% to +15%

Source: AACE International Recommended Practice No. 18R-97

These estimates are suitable for use for budget forecasting, CIP development, and project evaluations, with the understanding that refinements to the project details and costs would be necessary as projects proceed into the design and construction phases. All costs have been adjusted to an Engineering News Record Construction Cost Index (ENR CCI) of approximately 12,115, which represents the average of the April 2020 ENR CCI for "20 Cities Average" and "San Francisco" indices.

Cost criteria include baseline unit construction costs for gravity sewers using open-cut methods. Pipe bursting is sometimes a more cost-effective option for projects that involve upsizing existing sewers to 15-inch diameter or smaller; this construction method could be considered during design. Costs for gravity trunk sewers vary with pipe diameter and depth (in the case of open-cut construction). Allowances added to the baseline construction cost include mobilization/demobilization and project-specific for remove and replace construction and traffic control for work in roadways. A 30 percent allowance for contingencies for unknown conditions was also included for all projects, as well as an allowance of 25 percent of construction cost for engineering, administration, and legal costs. For pump stations, costs include site work, mechanical and electrical equipment specific to each station.

3.5.3 Proposed Capacity Improvement Project Descriptions

Improvement projects were developed as a series of improvements that sequentially decrease surcharging in downstream sewers. These improvement projects, including estimated capital improvement costs, are discussed below and summarized in **Table 3-10** and shown in **Figure 3-12**. Individual improvement project cost estimate details as well as detailed project figures are provided in Appendix F.

3.5.3.1 Improvement Project 1

Improvement Project 1 would increase the capacity of PS 26 (Sierra College Boulevard PS) as needed to limit surcharging in the Old Auburn Trunk sewer (Area A and Area B). The weir leading to PS 26 would be unchanged and would divert flows when depth in the sewer exceeds half the sewer diameter. Because this project would substantially increase flows through the sewer on Sierra College Boulevard (Area G), this project also includes upsizing those pipelines to 10, 12, and 15-inch sewers to eliminate surcharging in that line.

PS 26 will need to be modified to meet the increased firm capacity, from 0.43 mgd to 1.6mgd. If the existing wet well is large enough, it could be retrofitted with new, higher flow pumps. The existing wet well at PS 26 is 8 feet in internal diameter. Updated design criteria were provided to a Flygt pump representative and, based on the minimum wet well sizing for their recommended pump selection, the existing wet well is sufficiently large to be reused with a larger pump.

The pump selection provided should be considered preliminary. Given the high total pump station head and large motor of the resulting pump selection, an evaluation of alternatives to reduce the pump size, via upsizing the discharge force main for example, should be considered during pre-design. A life cycle cost analysis may be appropriate to compare the difference between the additional headloss and resulting pumping costs versus the cost to upsize the force main.

3.5.3.2 Improvement Project 2

Improvement Project 2 would re-route the sewer on Sierra College Boulevard east on Eureka and reconnect to the regional trunk at East Roseville Parkway (Area F). This would relieve surcharge in Area E. Excess flows resulting in surcharge in Area F would be diverted through PS 25 to the northern sewershed, which does not have capacity concerns. The preliminary project would upsize existing 8 and 10-inch sewer on Eureka Road and E Roseville Parkway. Since the connection is about 100 feet downstream of the PS 25 diversion structure, this improvement project may increase flows (and associated surcharge) in Area F (unless adjustments are made to the PS 25 diversion structure, as discussed in Improvement Project 3).

3.5.3.3 Improvement Project 3

Improvement Project 3 would alter the piping and diversion structure in the vicinity of PS 25 (Rollingwood PS) to convey additional flow away from Area C, Area D, and Area F, and increase the capacity of PS 25 as needed to accommodate the additional flow. For this improvement project, the diversion structure would be converted to divert any flows exceeding peak dry weather flow (up to approximately 2.6 mgd with buildout land uses under peak wet weather conditions),. It should be noted that the 2009 Systems Evaluation assumed diversion of 3.2 mgd through PS 25 with buildout land uses under peak wet weather conditions.

A new junction structure would need to be installed at E Roseville Parkway (or the existing junction structure would need to be relocated) in order to capture the additional flows.

PS 25 would need to be modified to meet the increased firm capacity. If the existing wet well is large enough, it could be retrofitted with new, higher flow pumps. The existing wet well at PS 25 is 10 feet in internal diameter. Updated design criteria were provided to a Flygt pump representative and, based on the minimum wet well sizing for their recommended pump selection, the existing wet well could be reused.

Table 3-10: Proposed Capacity Improvement Projects

Project	Location	Existing Sizes	Improved Sizes[a]	Description	Estimated Capital Improvement Cost
1	PS 26	0.43 mgd firm capacity	1.6 mgd PWWF at Buildout	Increased Capacity of PS 26 and sewers on Sierra College Blvd directly downstream of PS 26 to relieve Old Auburn Trunk sewer (Area A)	$1,606,000
	Sierra College Blvd (Area G)	500 ft of 8-inch 1,900 ft of 10-inch	500 ft of 10-inch (upsized from 8-inch) 900 ft of 12-inch (upsized from 10-inch) 1,000 ft of 15-inch (upsized from 10-inch)		
2	Eureka Road and E. Roseville Parkway	800 ft of 8-inch 1,400 ft of 10-inch	2,200 of 15-inch (upsized from 8 or 10-inch) 1,200 ft of new 15-inch.	Redirect flows from PS 26 and Sierra College Blvd down Eureka Road to relieve Area E.	$1,831,000
3	PS 25 (pumps)	2.02 mgd firm capacity	2.6 mgd PWWF at Buildout	Increased Firm capacity of PS 25 to meet Buildout PWWF (depends on alternative). New weir structure or adjustments to existing structure at PS 25 to convey the maximum potential flow through PS 25 without any dry weather flows.	$758,000
	PS 25 diversion structure	N/A	New diversion structure and related piping		

Notes:

a. Note that pipeline capacity increases could be accomplished through parallel pipes, rather than upsizes.

3.5.4 Timing of Proposed Improvement Projects

While Project 1 is needed for current demands, Project 2 and Project 3 are expected to be triggered by future development. For the purpose of this Systems Evaluation, an approximate number of equivalent dwelling units upstream of the capacity deficiency that would trigger the need for a project has been estimated by applying a reduction factor to future flows to represent percentage of buildout. Nearly all of the future growth that would trigger the projects would occur in SMD-2 and SMD-3 (with less than 100 EDUs of future growth anticipated for SPMUD and Roseville). Based on the SMD2 and SMD3 growth projections provided by Placer County, this would occur beyond the 2060 planning horizon provided.

The timing estimated here is subject to change, and could be impacted by the following assumptions:

- Inflow and Infiltration rates for existing sewers are assumed to remain approximately the same. These rates could change based on pipe condition and maintenance activities (such as rehabilitation and repair) in the collection system.
- Inflow and Infiltration rates for new sewers are assumed based on typical values. Actual I/I rates could be higher or lower than assumed.
- The estimates are based on an assumed rebound of dry weather flows to 190 gpd per EDU. If dry weather flows do not rebound, the timing for Project 2 and Project 3 could be somewhat delayed.

Future studies should monitor the I/I rates and update these estimates as needed. The number of EDUs in SMD2/SMD3 that would trigger the proposed project are summarized in **Table 3-11**.

Table 3-11: Timing of Proposed Capacity Improvement Projects

Project	Description	Estimated Capital Improvement Cost	Approximate Additional EDUs in SMD2/SMD3 to Trigger Project[a]
1	Increased Capacity of PS 26 and sewers on Sierra College Blvd directly downstream of PS 26 to relieve Old Auburn Trunk sewer (Area A)	$1,606,000	Existing
2	Redirect flows from PS 26 and Sierra College Blvd down Eureka Road to relieve Area E.	$1,831,000	~1,800[b]
3	Increased Firm capacity of PS 25 to meet Buildout PWWF (depends on alternative). New weir structure or adjustments to existing structure at PS 25 to convey the maximum potential flow through PS 25 without any dry weather flows.	$758,000	~1,800[c]

Notes:

a. Based on a percentage of buildout factor applied to future model loads.
b. Represents approximately 60% of buildout. There are approximately 8,400 Existing EDUs upstream of the deficiency triggering Improvement Project 2, and approximately 10,200 EDUs would trigger the need for improvement.
c. Represents approximately 60% of buildout. There are approximately 11,900 Existing EDUs upstream of the deficiency triggering Improvement Project 3, including 7,600 in Placer County, 4,200 in Roseville, and less than 100 in SPMUD. Approximately 13,700 EDUs would trigger the need for the improvement.

4. WASTEWATER TREATMENT PLANT EXPANSION EVALUATION

4.1 Introduction

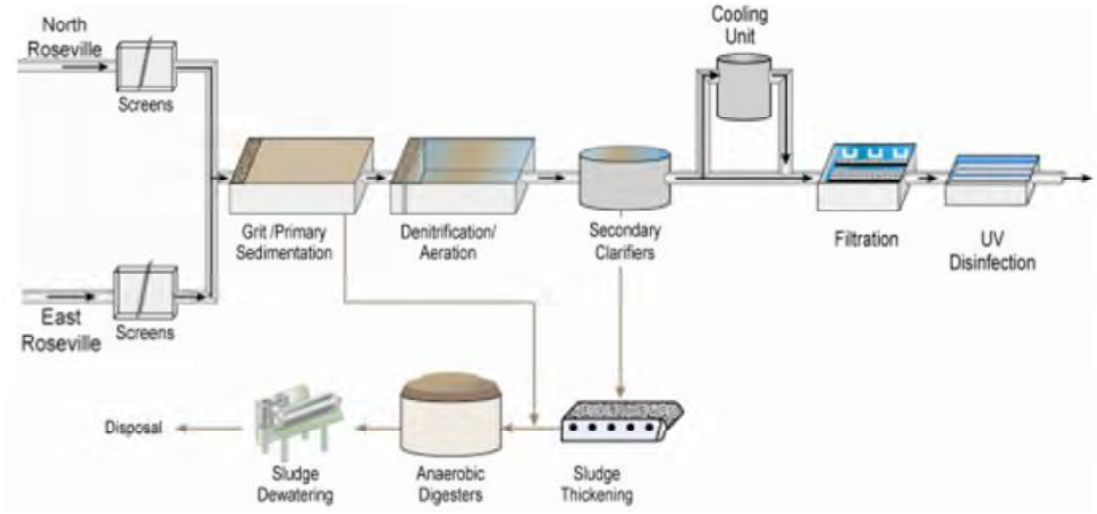
Based on the updated growth projections provided by the SPWA partners through fiscal year 2059-2060 and at buildout, this section provides facility expansion recommendations for Dry Creek Wastewater Treatment Plant (DCWWTP) and Pleasant Grove Wastewater Treatment Plant (PGWWTP), which treat the entirety of flows from the SPWA service area. The recommendations address timing, phasing, and preliminary conceptual costs of the expansions required through buildout to address both flows and loads, as well as identifying next steps for confirming current plant capacity to accurately reflect recent and ongoing capital improvements.

The analysis provides updates to the following flow and loading parameters for DCWWTP and PGWWTP:

- Flows: existing and projected influent flow through buildout:
    - Average Dry Weather Flow (ADWF)
    - Average Annual flow (AA)
    - Peak Month Flow (PMF)
    - Peak Day Wet Weather Flow (PDWWF)
    - Peak Hour Wet Weather Flow (PHWWF)
- Loads: existing and projected influent loads through buildout:
    - Biochemical Oxygen Demand (BOD), Annual Average (AA) and Maximum Month (MM)
    - Total Suspended Solids (TSS), AA and MM
    - Ammonia (NH_3), AA and MM

4.1.1 Dry Creek Wastewater Treatment Plant

Much of the DCWWTP was constructed in 1974 and was expanded in 1991 to treat an ADWF of 18 mgd. In June of 2004, a portion of the influent flow was diverted to the newly constructed PGWWTP, freeing up some treatment capacity at the time. Recently, nutrient removal upgrades were completed at DCWWTP to ensure reliable compliance with the NPDES permit limits (including the 10 mg/L average monthly limit for nitrate plus nitrite).[1] Currently, the flow meter on the discharge of the Influent Pump Station is being modified to increase the PHWWF hydraulic capacity to 36 mgd.



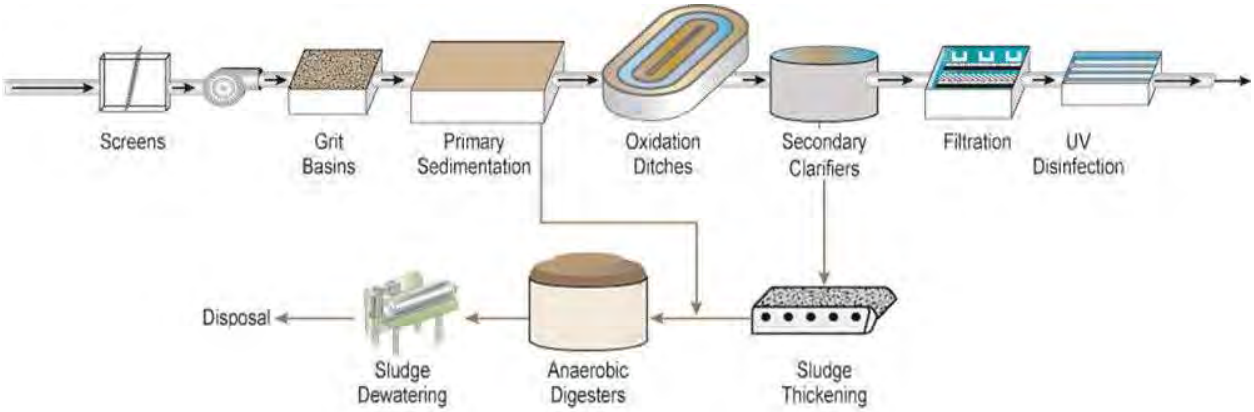
Population in the SPWA service area has continued to grow steadily, with loadings increasing substantially while ADWF decreased. The ADWF at DWWTP has decreased from 10.5 mgd in 2009to approximately 8.6 mgd as of 2019.

Equally as important as the hydraulic capacity of a plant is its biological treatment capacity. Design of the 1991 expansion of the plant was based on an influent BOD concentration of 160 mg/L, and the corresponding AA and MM loadings of 24,000 lbs/day and 36,000 lbs/day. Since 1991, the influent BOD concentration has increased to 425 mg/L, resulting in much higher BOD loadings than in previous projections. The impact of higher influent BOD concentration and loadings is discussed in Section 4.3.1.

A schematic of the DCWWTP liquid and solids treatment train is shown in **Figure 4-1**.

[1] Source: City of Roseville, DCWWTP Nitrate Reduction Improvements Project, Basis of Design Report (May 2017).

Figure 4-1: DCWWTP Treatment Schematic



4.1.2 Pleasant Grove Wastewater Treatment Plant

Construction of the PGWWTP was completed in 2004. It was designed for an ADWF of 12 mgd, assuming historical domestic strength wastewater, similar to the Dry Creek Plant. Subsequent study of the plant's treatment processes and influent loading resulted in PGWWTP's capacity being lowered to an equivalent flow of 9.5 mgd. Like the DCWWTP, this was partially a result of influent BOD concentrations trending much higher over time than anticipated in the initial design. Current ADWF is approximately 7.6 mgd with an average influent BOD concentration of 358 mg/L.

To ensure the plant can reliably treat 12 mgd ADWF at the current higher loadings, an expansion project is currently underway, with anticipated completion/commissioning by fiscal year (FY) 22/23.[1] The expansion will add a primary sedimentation process to the liquid treatment train, which currently includes influent screening and grit removal, secondary treatment/denitrification in oxidation ditches, secondary clarification, filtration, and disinfection. The solids treatment process is being upgraded with sludge thickening using rotary drum thickeners and anaerobic digestion of the combined thickened secondary sludge and primary sludge, upstream of the existing dewatering centrifuges (which currently dewater only the secondary sludge). These upgrades will provide additional solids treatment capacity as well as biological treatment capacity. **Figure 4-2** shows a schematic of the PGWWTP treatment train reflecting the upgrades currently under construction.

Figure 4-2: PGWWTP Treatment Schematic

4.2 Flows and Loadings

Influent flows and loading (organic loading as measured by BOD and solids loading as measured by TSS) for both the DCWWTP and PGWWTP were established by analyzing daily plant influent data provided by the City of Roseville for the period from January 1, 2016 through September 19, 2019 for influent flow and from January 1, 2013 through September 19, 2019 for loadings. In addition, hourly flow data from December 1, 2016 to September 17, 2019 (which incorporated high winter flow periods) was used to establish peak hour flows.

Projected flows for both the DCWWTP and PGWWTP were calculated based on population and non-residential growth, normalized to account for diversity in land uses by establishing equivalent dwelling units (EDUs). EDU projection data were provided by each of the SPWA JPA Partners (City of Roseville, Placer County, and South Placer Municipal Utility District)[1]. Flow projections were developed by multiplying the projected EDUs by an ADWF contribution of 190 gallons per day (gpd) per EDU, in accordance with the estimate developed in the 2009 Systems Evaluation.

4.2.1 Current Flows and Peaking Factors

Current ADWF was established by averaging flows observed at each plant for the period of July through September. While the ADWF is usually thought of as the rated capacity of a treatment plant, the design of treatment systems must also accommodate significant seasonal and diurnal variations in influent flow. A treatment plant must be designed to prevent hydraulic overloads and wash out of solids during peak day and peak hour events. Generally, preliminary and primary treatment systems are sized for peak day or peak hour flow, while secondary treatment systems must meet maximum month organic loading peaks. Sizing treatment processes appropriately aids treatment plants in meeting discharge limits during the higher flows and loading periods that can otherwise stress or overwhelm the plant processes.

Current flow conditions and the associated peaking factors for both plants are summarized in **Table 4-1**.

[1] Data provided on July 2019 for Placer County, August 2019 for SPMUD, and November 2016 for the City of Roseville

Table 4-1: Current Flows and Peaking Factors

Flow Condition	DCWWTP		PGWWTP	
	Current Flow, mgd	Peaking Factor	Current Flow, mgd	Peaking Factor
ADWF	8.6	1.0	7.6	1.0
AA	10.8	1.2	8.1	1.07
PMF	18.4	2.12	10.3	1.36
PDWWF	27.9	3.22	16.9	2.23
PHWWF	36.0	4.19	20.4	2.69

It should be noted that the current plant data reflect a significantly lower flow contribution per EDU than the previously established unit flow factor of 190 gpd/EDU. Approximately 57,747 EDUs are tributary to DCWWTP for FY 19/20. Based on the current ADWF, the equivalent unit flow contribution is approximately 150 gpd/EDU. At PGWWTP, there are approximately 54,907 EDU tributary to the plant for FY19/20, which reflects a flow contribution of 138 gpd/EDU. This is likely the result of several factors, including water conservation efforts over the past decade, drought conditions that were experienced throughout California from 2011-2016, and lower levels of development than previously anticipated prior to the impacts of the recession in 2008-2009.

These flow contributions per EDU may rebound back to historical levels and, to provide a safety factor, the 190 gpd/EDU will continue to be used for this analysis. This unit flow factor should be tracked closely and, if warranted, the per EDU value adjusted accordingly over time.

4.2.2 Projected Plant Influent Flows

Future plant flows were projected over the planning horizon to fiscal year 2059-2060 (FY 59/60)[1] and to ultimate buildout conditions, based on the information provided in Chapter 2. ADWF projections at FY 59/60 and buildout are calculated by multiplying the EDU projection by the flow contribution per EDU. Peaking factors from **Table 4-1** were then applied to established ADWF per EDU based on current flows (138 gpd/EDU at PGWWTP and 150 gpd/EDU at DCWWTP) and added to ADWFs difference calculated from 190 gpd/EDU and current ADWF/EDU to project the additional flow conditions. This approach avoids using peaking factors on projected ADWF calculated from 190 gpd/EDU for a more realistic flow estimate. These flows are summarized in **Table 4-2** and **Table 4-3**.

Table 4-2: Projected FY 59/60 and Buildout EDUs and Flows at DCWWTP

Condition	DCWWTP			
	FY 59/60 EDU	FY 59/60 Flow, mgd	Buildout EDU	Buildout Flow, mgd
ADWF	87,772	16.7	96,000	18.2
AA	---	19.9	---	21.8
PMF	---	31.5	---	34.4
PDWWF	---	45.9	---	50.2
PHWWF	---	58.6	---	64.1

[1]SPWA's fiscal year runs from July 1 to June 30.

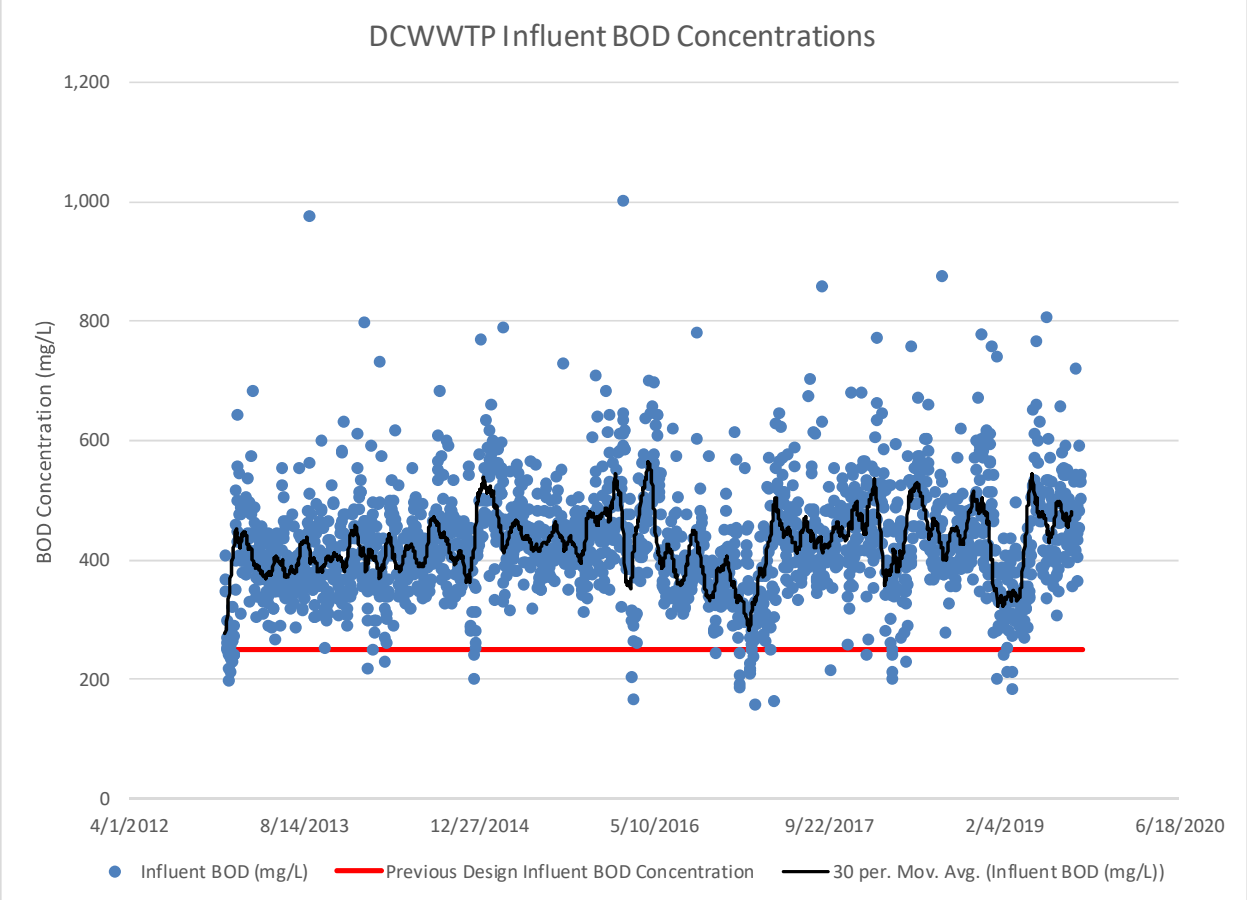
Table 4-3: Projected FY 59/60 and Buildout EDUs and Flows at PGWWTP

Condition	PGWWTP			
	FY 59/60 EDU	FY 59/60 Flow, mgd	Buildout EDU	Buildout Flow, mgd
ADWF	92,864	17.6	145,000	27.6
AA	---	18.6	---	29.0
PMF	---	22.2	---	34.8
PDWWF	---	33.4	---	52.3
PHWWF	---	39.3	---	61.5

4.2.3 Current BOD Loadings

In previous studies, design parameters were established based on much lower influent BOD concentrations, ranging from 248 mg/L at DCWWTP to 285 mg/L at PGWWTP. The plant data set provided for this TM (which is an extended data set from 2013-2019) indicates an average influent BOD concentration of 425 mg/L at DCWWTP, and 358 mg/L at PGWWTP. The range in influent BOD concentrations at both plants are shown in **Figure 4-3** and **Figure 4-4**.

Figure 4-3: Influent BOD Concentrations at DCWWTP



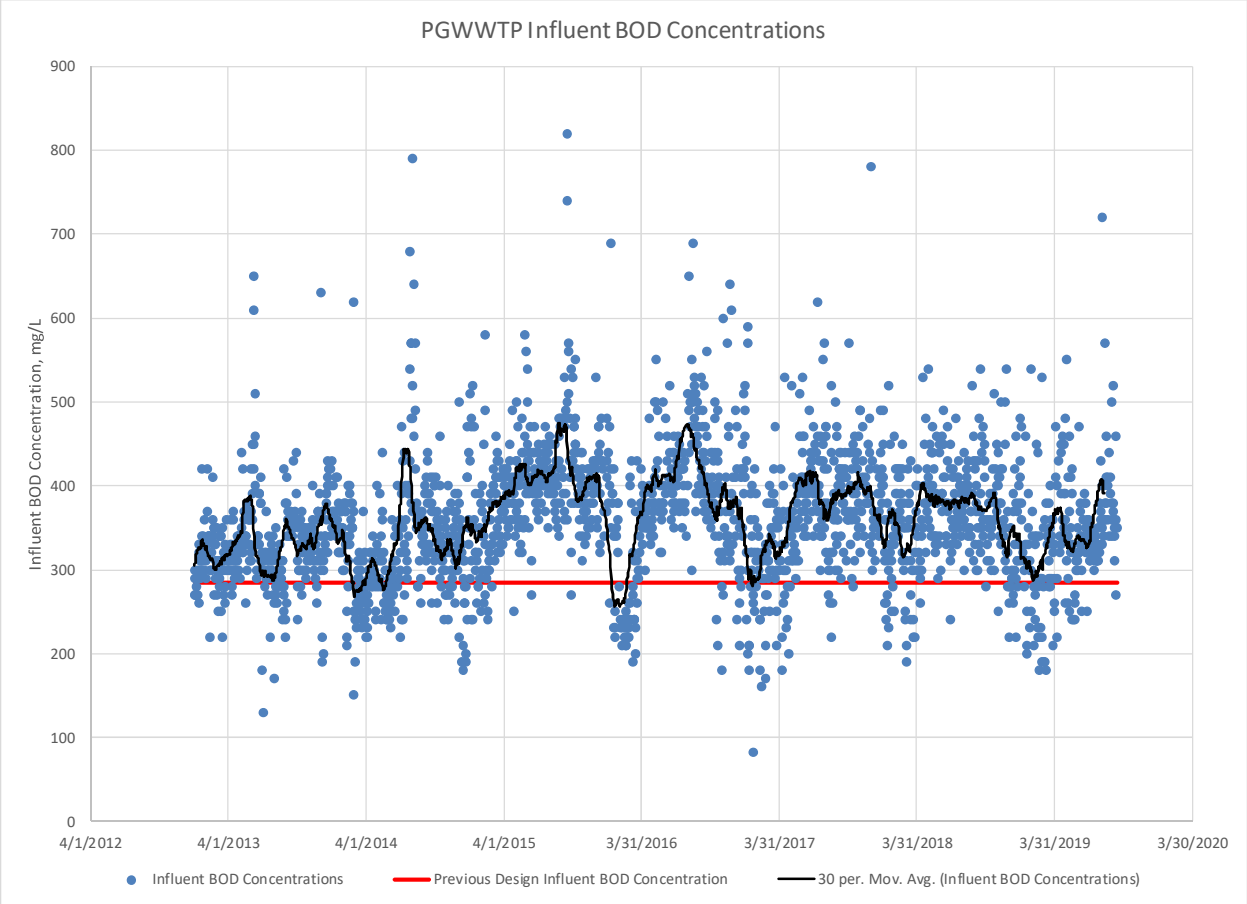


Figure 4-4: Influent BOD Concentrations at PGWWTP

These higher concentrations are likely a result of water conservation efforts over the past decade, combined with the drought conditions that were experienced throughout California from 2011-2016, though the relatively high concentrations at DCWWTP should be confirmed. The effect of conservation is on top of the demographic changes in the SPWA service area since the treatment plants were designed that brought much more commercial flows and loadings along with changing development patterns, such that the strength of the wastewater at both plants evolved from low strength domestic wastewater to moderate strength commercial wastewater, influenced by more food service, restaurant, brewery and other contributions.

A 30-day moving average of influent BOD concentrations is also shown on these figures. This moving average shows that current influent concentrations are now holding relatively constant, though they are higher than previous designs accounted for. This is an indication that influent BOD concentrations have now leveled off, however we recommend the SPWA monitor this parameter in the long term. When the State experiences another drought or there are changes to land use within the service area such as densification, influent loading concentrations may increase further.

4.2.4 Current and Projected Plant Influent Loadings

The January 1, 2013 through September 19, 2019 data set also included daily influent plant loadings for BOD, TSS, and NH_3. These data were analyzed to establish current annual average (AA) and maximum month (MM) pollutant loadings. Current MM loadings were established by taking the maximum value of a 30-day running average of the daily influent data provided. The peaking factors for each parameter were established by dividing the MM loading by the AA loading.

Projected loads, shown in **Table 4-4** and **Table 4-5,** were calculated by using the average loadings from the data set provided and establishing AA loading per EDU. Peaking factors were then applied to establish the FY 59/60 and buildout MM loads.

Table 4-4: Current and Projected Influent Loading at DCWWTP

Parameter	Condition	Unit	DCWWTP			
			Current	FY59/60	Buildout	Peaking Factor
BOD	Average Concentration	mg/L	425	---	---	---
	AA Loading	lbs/day	33,900	52,000	56,000	---
	MM Loading	lbs/day	47,600	73,000	79,000	1.41
TSS	Average Concentration	mg/L	540	---	---	---
	AA Loading	lbs/day	42,800	65,000	71,000	---
	MM Loading	lbs/day	60,800	92,000	101,000	1.42
NH_3	Average Concentration	mg/L	23	---	---	---
	AA Loading	lbs/day	1,800	2,800	3,100	---
	MM Loading	lbs/day	2,500	4,000	4,200	1.35

Table 4-5: Current and Projected Influent Loading at PGWWTP

Parameter	Condition	Unit	PGWWTP			
			Current	FY59/60	Buildout	Peaking Factor
BOD	Average Concentration	mg/L	358	---	---	---
	AA Loading	lbs/day	22,400	38,000	60,000	---
	MM Loading	lbs/day	28,000	48,000	75,000	1.25
TSS	Average Concentration	mg/L	291	---	---	---
	AA Loading	lbs/day	18,100	31,000	48,000	---
	MM Loading	lbs/day	26,400	45,000	70,000	1.46
NH_3	Average Concentration	mg/L	40	---	---	---
	AA Loading	lbs/day	2,400	4,100	6,400	---
	MM Loading	lbs/day	2,700	4,600	7,100	1.11

4.3 Plant Capacity Comparison and Expansion Phasing

This comparison of current plant capacity and projected future flows and loads accounts for only hydraulic and carbonaceous BOD treatment capacity because these parameters have driven capacity expansion timing in the past. Potential nutrient removal requirements have not been considered in expansion timing and phasing. Evaluation of plant capacity with respect to TSS and ammonia removal should be incorporated into a subsequent analysis of plant capacity. Existing plant capacity was provided in the following documents:

- South Placer Regional Wastewater and Recycled Water Systems Evaluation, RMC Water and Environment, December, 2009
- Technical Memorandum 4b: Wastewater Treatment Plants Expansion Requirements (TM 4b), RMC Water and Environment, March 28, 2006
- DCWWTP Initial Assessment Final Report, CH2M Hill, Inc, August 2008
- Final Pleasant Grove Wastewater Treatment Expansion Basis of Design Report, Kennedy/Jenks Consultants, March 2016
    - Executive Summary
    - Technical Memorandum No. 1: Influent Flow and Load Characteristics and Projections, Pleasant Grove Wastewater Treatment Plant

- City of Roseville, Dry Creek Wastewater Treatment Plant, Influent Pump Station Hydraulic Analysis, Waterworks Engineers, March 2018.

Current loading capacities at each plant based on these documents are summarized in **Table 4-6.**

Table 4-6: Current Hydraulic and Organic (BOD) Capacities at DCWWTP and PGWWTP

Plant	DCWWTP Existing	PGWWTP Existing	PGWWTP FY 22-23[a]
ADWF Hydraulic Treatment Capacity, mgd	18[b]	12[b]	12[a,c]
Biological Treatment Capacity, AA BOD Loading, lbs/day	26,200[d]	22,000[b]	34,500[c]
Biological Treatment Capacity, MM BOD loading, lbs/day	32,500[d]	N/A	40,100[c]

Notes:

a. Plant improvements that expand treatment capacity at PGWWTP are currently under construction and are expected to be in service by FY 22-23. Capacity comparisons in this TM take this into consideration.
b. Permitted plant capacity and capacity documented in the South Placer Regional Wastewater and Recycled Water Systems Evaluation, RMC Water and Environment, December 2009.
c. Source: Table 1.1, Technical Memorandum No. 1: Influent Flow and Load Characteristics and Projections. Final Pleasant Grove Wastewater Treatment Expansion Basis of Design Report, Kennedy/Jenks Consultants, March 2016
d. Source: Table 5-1, DCWWTP Initial Assessment Final Report, CH2M Hill, Inc, August 2008

The plant data show that current BOD loadings are higher than the BOD treatment capacities estimated in the reference documents at both plants (marginally higher at Pleasant Grove). However, according to City staff, the plants have consistently been in compliance with their NPDES discharge permits. This suggests that the **actual** plant capacities are beyond their nominal design capacity with respect to BOD. Additionally, it is unclear to what extent interim improvements such as the Nitrate Reduction Improvements project at DCWWTP have affected the plant capacity. For the purposes of this TM, it is assumed that the AA and MM BOD removal capacity at each plant are, at minimum, the same as their current BOD loadings. **Table 4-7** shows the revised treatment capacities based on current AA and MM BOD loadings. It is recommended that process-specific sampling, process modeling, and, if needed, stress testing be performed to determine the actual plant capacity, the limiting processes, and corresponding process improvements needed at each plant. While this evaluation will be immediately helpful at Pleasant Grove, it is essential at Dry Creek because of the large discrepancy between current loading and nominal capacity.

Table 4-7: Revised Current Hydraulic and Organic (BOD) Capacities at DCWWTP and PGWWTP

Plant	DCWWTP	PGWWTP Existing	PGWWTP FY 22-23[a]
ADWF Hydraulic Treatment Capacity, mgd	18[b]	12[b]	12[a,c]
Biological Treatment Capacity AA BOD Loading, lbs/day	33,900[d]	22,400[d]	34,500[c]
Biological Treatment Capacity, MM BOD Loading, lbs/day	48,000[d]	28,000[d]	40,100[c]

Notes:

a. Plant improvements that expand treatment capacity at PGWWTP are currently under construction and are expected to be in service by FY 22-23. Capacity comparisons in this TM take this into consideration.
b. Permitted plant capacity and capacity documented in the South Placer Regional Wastewater and Recycled Water Systems Evaluation, RMC Water and Environment, December, 2009.
c. Source: Table 1.1, Technical Memorandum No. 1: Influent Flow and Load Characteristics and Projections. Final Pleasant Grove Wastewater Treatment Expansion Basis of Design Report, Kennedy/Jenks Consultants, March 2016
d. Current BOD loadings based on plant data from January 2013 through September 2019.

4.3.1 Dry Creek Wastewater Treatment Plant

This section discusses the hydraulic and biological capacity of the DCWWTP and preliminary phasing of future improvements. Based on the estimated plant capacity and projected flow and loading requirements, two phases of improvements are recommended.

4.3.1.1 Hydraulic Capacity and Phasing

Based on the projected ADWF of 16.7 for FY 59/60 and 18.2 mgd for buildout, the current DCWWTP ADWF hydraulic capacity of 18 mgd is effectively sufficient through buildout. **Figure 4-5** shows ADWF capacity plotted against the flow projected over the planning period. **Figure 4-5** also presents graphs for ADWF and PDWWF rebound based on a linear interpolation from 150 gpd/EDU calculated based on current flows in FY 19/20 to a potential flow factor of 190 gpd/EDU in FY 59/60. This is not to say that all unit processes are sufficient to handle future peak flows associated with wet weather; assuming peaking factors hold steady over time, or increase, unit processes based upon flow criteria (as opposed to loading) will need to be expanded as presented below.

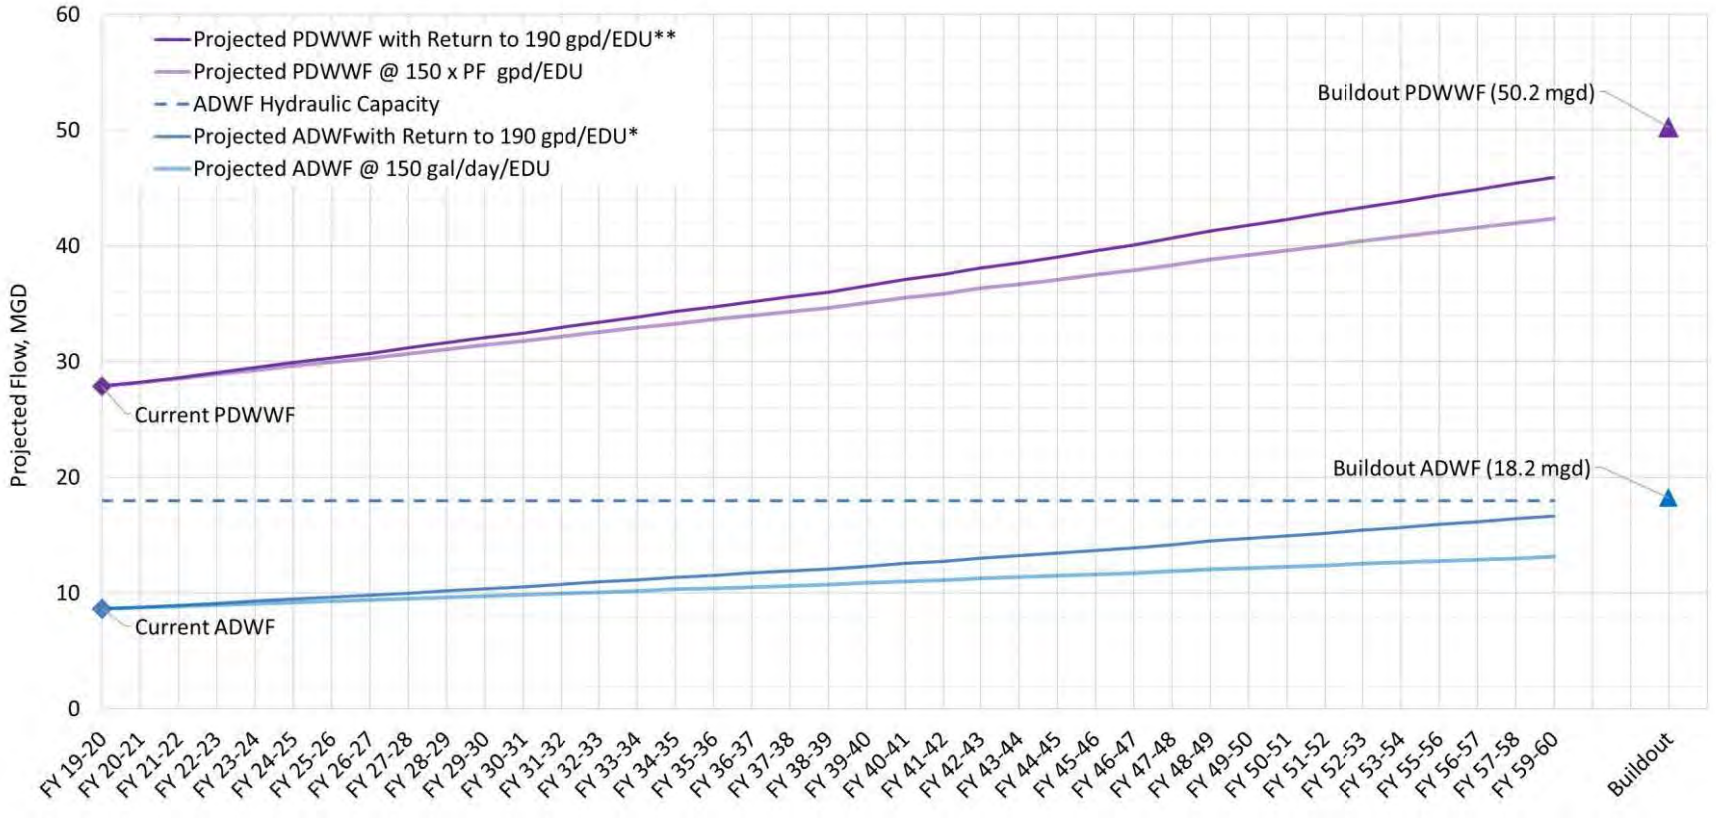
4.3.1.2 Biological Capacity and Phasing

Preliminary biological capacity improvements for DCWWTP have been identified, which should be confirmed and refined when additional capacity testing has been completed. Based on **Table 4-7**, DCWWTP is currently running at or beyond its nominal design capacity with respect to BOD loading. It is recommended that SPWA implement Phase 1 expansion in approximately FY 24/25 which is the earliest practical time frame it could be implemented considering planning, design, and construction duration. The plant will reach 94% of the expanded Phase 1 AA and MM BOD loading capacity in FY 39/40. Therefore, it is recommended to implement Phase 2 biological improvements at this time concurrent with necessary wet weather hydraulic improvements. Phase 2 improvements in FY 39/40 are recommended to bring the plant BOD loading capacity to its buildout AA and MM projections of 56,000 and 79,000 lbs/day, respectively. Figure 4-6 shows AA and MM biological treatment capacities plotted against the loadings projected over the planning period and the anticipated phasing. As discussed in Chapter 5, the timing and size of the recommended projects should be reviewed after additional capacity analysis and facility planning is completed.

4.3.2 Pleasant Grove Wastewater Treatment Plant

This section discusses the hydraulic and biological capacity of the PGWWTP and the recommended phasing of future improvements. This phasing includes improvements that are currently under design and are expected to be in service by FY 22-23. Based on the estimated plant capacity and projected flow and loading requirements, two phases of improvements beyond the FY 22-23 project are recommended.

4.3.2.1 Hydraulic Capacity and Phasing



Although the PGWWTP hydraulic capacity is 12 mgd, based on the references above, the current ADWF treatment capacity at the PGWWTP is rated at 9.5 mgd. The improvements currently under construction will expand PGWWTP's treatment capacity to its hydraulic capacity rating of 12 mgd. Based on the ADWF projections calculated from a linear interpolation between current flow of 138 gpd/EDU and historic 190 gpd/EDU flow contribution, this capacity expansion should be sufficient to handle flows through approximately FY 28-29, though timing would depend on the rate of any rebound in sewer flows. It is currently recommended that Phase 1 hydraulic expansion be implemented in FY 28-29 to expand the plant ADWF to 15 mgd. Phase 1 expansion would carry the PGWWTP through FY 40-41. At that point, Phase 2 improvements may be needed to increase the plant ADWF capacity to FY 59/60 flow projections of 18 mgd. **Figure 4-7** shows ADWF plotted against the flow projected over the planning period and the anticipated phasing for improvements. **Figure 4-7** presents graphs for ADWF and PDWWF rebound based on linear interpolation from 138 gpd/EDU calculated based on current flows in FY 19/20 to a potential flow factor of 190 gpd/EDU in FY 59/60. As discussed in Chapter 5, the timing and size of the recommended projects should be reviewed after additional facility planning is completed and the gpd/EDU assumption is confirmed.

4.3.2.2 Biological Capacity and Phasing

Based on Table 4-7, PGWWTP is currently running at or beyond its nominal design capacity with respect to BOD loading. The improvements currently under design will expand the plant's AA and MM BOD loading capacities to 34,500 lbs/day and 40,100 lbs/day. These improvements should be sufficient to meet projected BOD loadings through FY 40/41 when Phase 2 hydraulic capacity improvements are recommended. During Phase 2 expansion, it is recommended that plant capacity be increased to accommodate projected FY59/60 AA and MM BOD loadings of 38,000 lbs/day and 48,000 lbs/day, respectively. The timing and magnitude of additional expansion to accommodate buildout will be determined in subsequent planning documents.

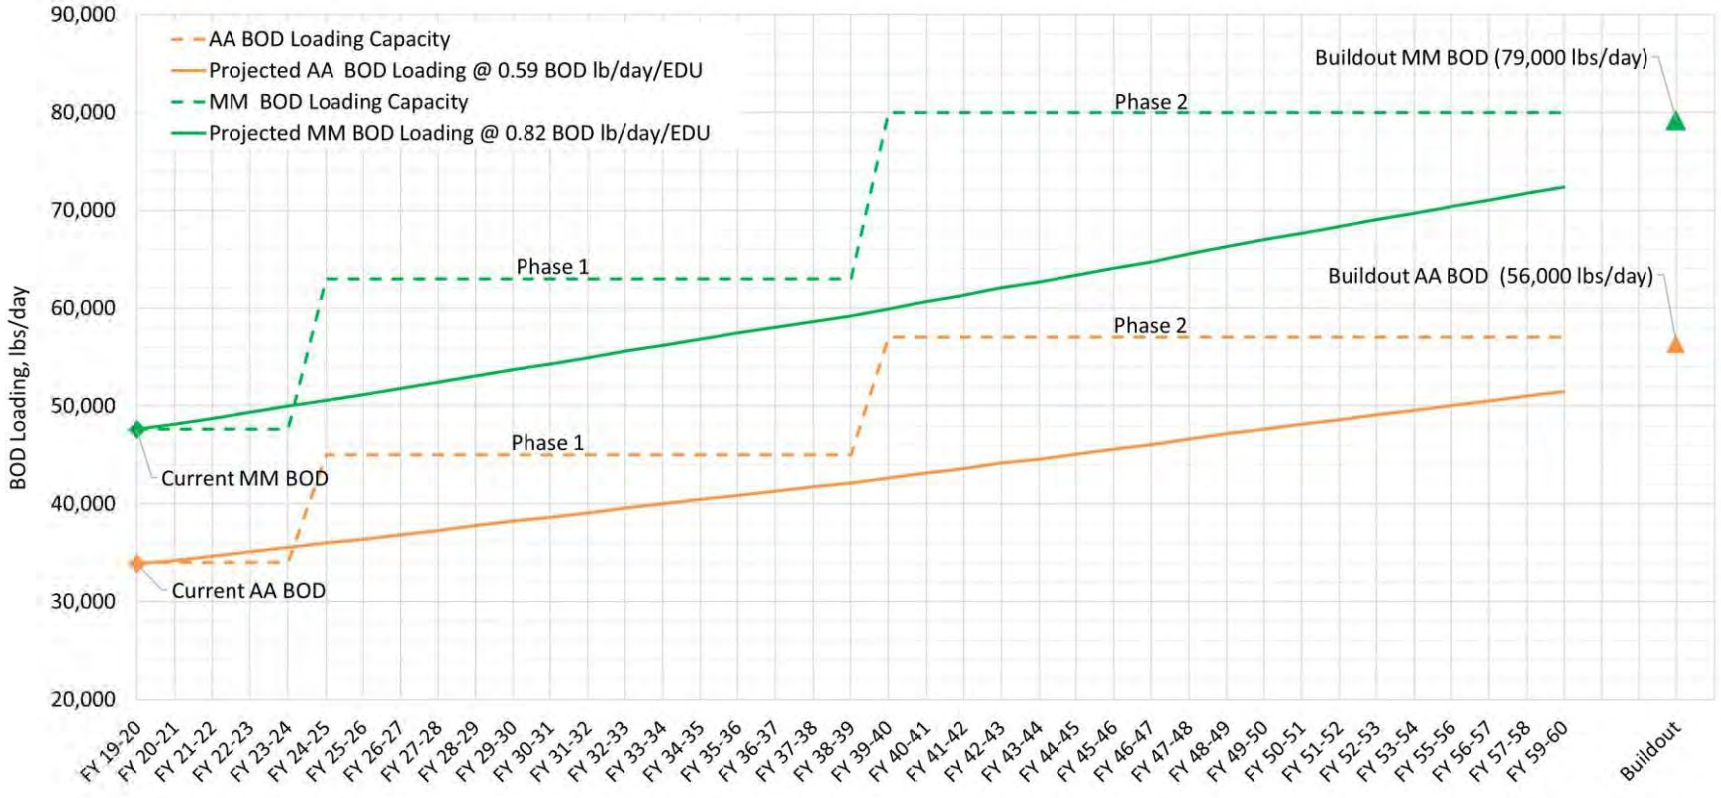


Figure 4-8 shows AA and MM biological treatment capacities plotted against the loadings projected over the planning period and the anticipated phasing.

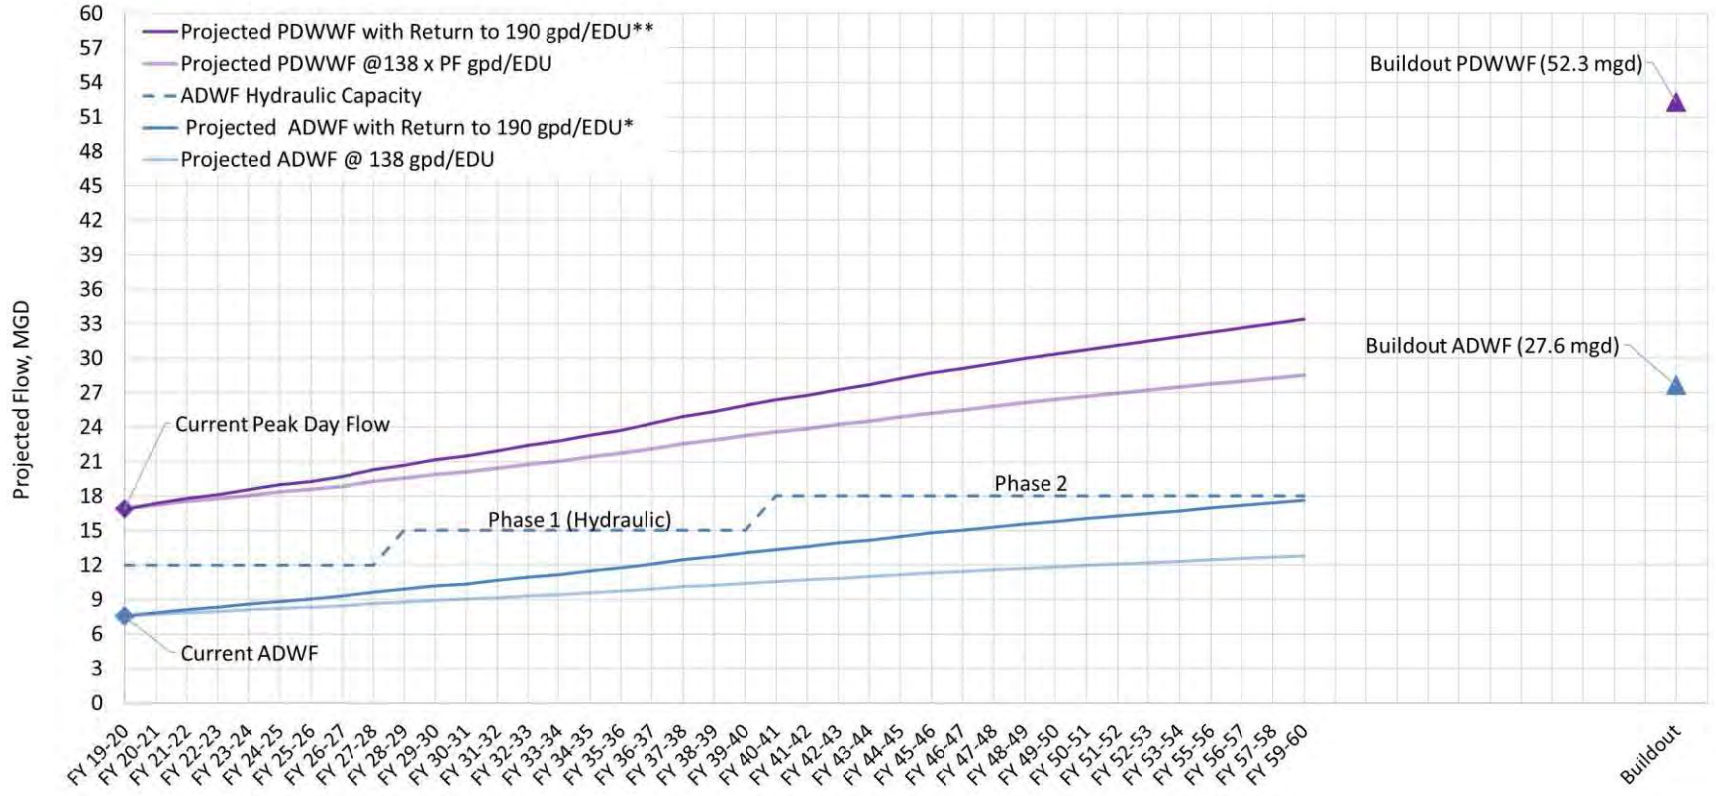
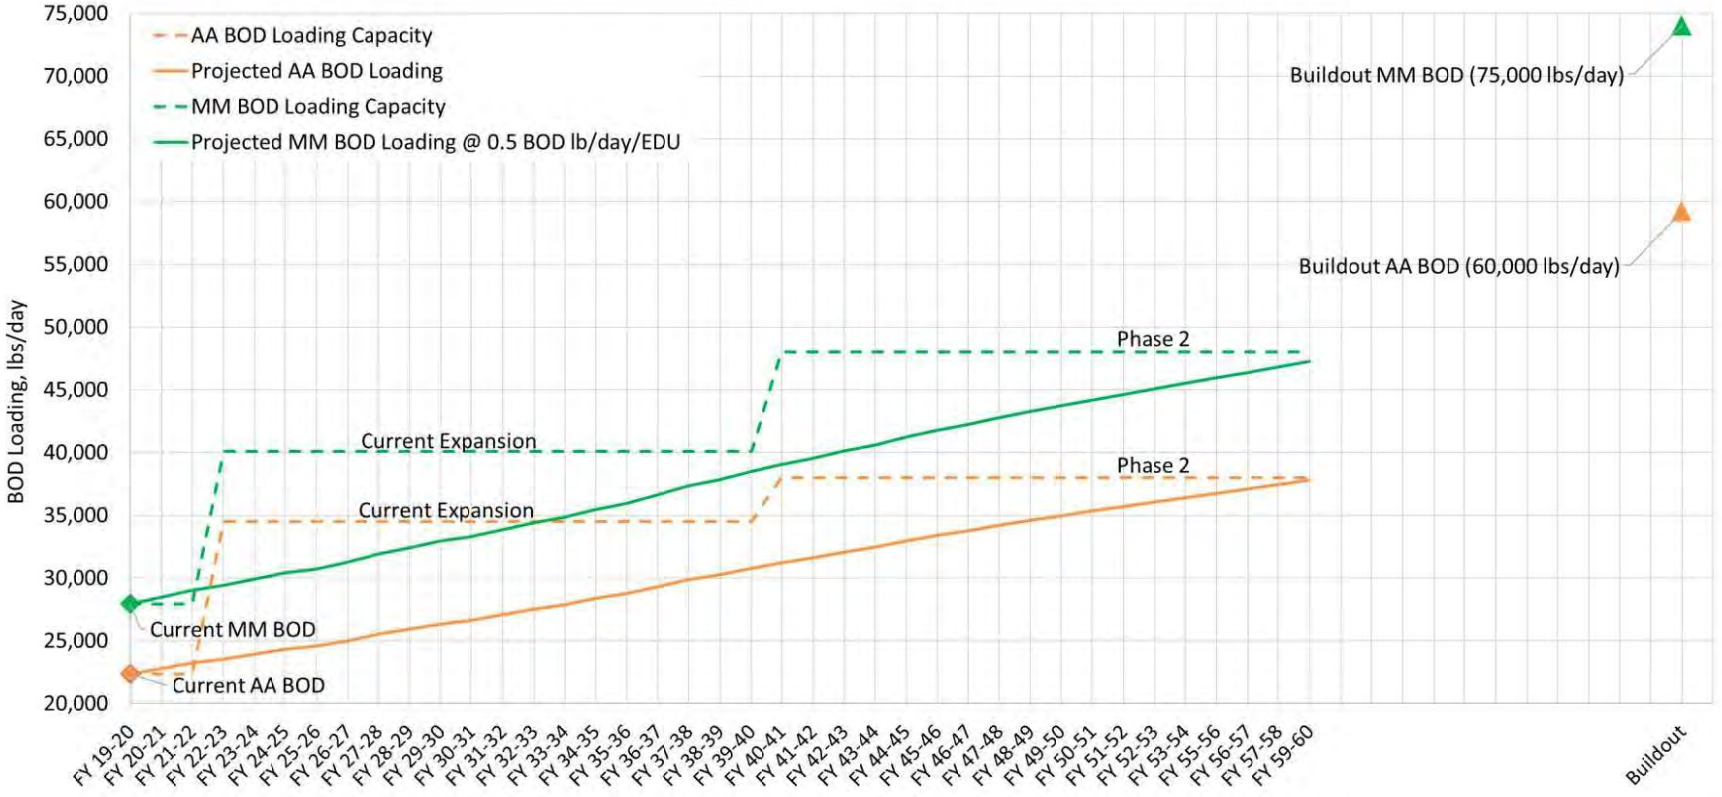
Figure 4-5: DCWWTP Hydraulic Capacity Comparison



* ADWF gpd/EDU flow factor is assumed to reach 190 gpd/EDU by FY 59/60, with a linear increase from 150 gpd/EDU at FY 19/20
**PDWWF is assumed to be ADWF flow plus 330 gpd/EDU of wet weather flow, based on current wet weather flowrates
*** Buildout date is currently unknown and is shown for graphical purposes only.

Figure 4-6: DCWWTP Biological Capacity Comparison



* Buildout date is currently unknown and is shown for graphical purposes only.

Figure 4-7: PGWWTP Hydraulic Capacity Comparison

* ADWF GPD/EDU factor is assumed to reach 190 gpd/EDU by FY 59/60, with a linear increase from 138 gpd/EDU at FY 19/20
**PDWWF is assumed to be ADWF flow plus 170 gpd/EDU of wet weather flow, based on current wet weather flowrates
*** Buildout date is currently unknown and is shown for graphical purposes only.

Figure 4-8: PGWWTP Biological Capacity Comparison

* Buildout date is currently unknown and is shown for graphical purposes only.

4.4 Conceptual Capital Cost Estimates

Opinions of probable cost were developed for the recommendations of this TM and are presented in this section. This section also provides the procedures and methodology used for developing planning-level capital cost estimates for PGWWTP and DCWWTP phased improvement projects. Note that improvements that would be required after the FY 59/60 planning horizon have not been estimated.

4.4.1 Cost Estimation Approach

This section describes the assumptions and procedures used to develop cost estimates for phased improvements at PGWWTP and DCWWTP. The cost estimates provided in this TM include improvements that would increase the plant capacity to treat the projected flows and loadings but does not include repair and replacement (R&R) projects or discretionary projects such as resource recovery improvements.

The estimated construction costs are based on a Class 5 estimate as defined by the Association for the Advancement of Cost Engineering (AACE) International cost estimate classification system. **Table 4-8** provides a summary of the estimate classes and expected accuracy range. For Class 5 estimates, the expected accuracy range is -20% to -50% on the low end and +30% to +100% on the high end.

Table 4-8: Cost Estimate Classification Matrix (AACE International)

Estimate Class	Level of Project Definition	Purpose of Estimate	Methodology	Expected Accuracy Range
Class 5	0% to 2%	Concept screening	Capacity factored, parametric models, judgement, or analogy	Low: -20% to -50% High: +30% to +100%
Class 4	1% to 15%	Study or feasibility	Equipment factored or parametric models	Low: -15% to -30% High: +20% to +50%
Class 3	10% to 40%	Budget authorization or control	Semi-detailed unit costs with assembly level line items	Low: -10% to -20% High: +10% to +30%
Class 2	30% to 75%	Control or bid/tender	Detailed unit cost with forced detailed take-off	Low: -5% to -15% High: +5% to +20%
Class 1	65% to 100%	Check estimate or bid/tender	Detailed unit cost with detailed take-cost	Low: -3% to -10% High: +3% to +15%

Source: AACE International Recommended Practice No. 18R-97

Construction costs were developed based on the improvements and unit costs provided in the prior planning documents listed below:

- Technical Memorandum 4b: Wastewater Treatment Plants Expansion Requirements, RMC Water and Environment, March 28, 2006 (TM 4b).
- DCWWTP Initial Assessment Final Report, CH2M Hill, Inc, August 2008 (CH2M Hill, 2008)
- Final Pleasant Grove Wastewater Treatment Expansion Basis of Design Report, Kennedy/Jenks Consultants, March 2016

Raw construction costs are estimated for each component based on estimated unit costs multiplied by quantity.

Construction cost factors were used to develop and escalate unit costs to reflect the current bid environment, industry trends, and project location as well as plant capacity increase. These factors are incorporated into the unit costs and are represented in two categories:

- **Engineering News Record's (ENR) Construction Cost Index (CCI) –** All project construction cost estimates are indexed to an ENR CCI of 12115 which represents the average of the April 2020 indices for San Francisco (SF) ENR and the "20-Cities" ENR, to account for the greater Sacramento area construction market.
- **Capacity Adjustment Factor –** The number of units listed in TM 4b were associated with different capacity increases than required in proposed improvement phasing in this Systems Evaluation. Proportional adjustment factors were used to account for these capacity increase differences. Further discussion is provided below.

Based on the level of detail available for Class 5 estimates, allowances are used for some of the direct construction elements including the site electrical, and instrumentation and control (I&C), site yard piping and mechanical, and site civil work estimates (i.e. direct construction costs). Allowance estimates are made using the percentages listed in **Table 4-9.**

Table 4-9: Direct Construction Cost Allowances

Construction Cost Allowance Types	Percent
Site Yard Piping & Mechanical	5%
Site Electrical / I&C/SCADA	15%
Site Civil	5%

From the direct construction cost subtotal, indirect construction cost factors are applied to develop an estimated total construction cost. These construction cost markups include the following:

- **Overhead and Profit –** Contractor overhead and profit (O&P) represents the general contractor's operating costs and estimated profit levels. The O&P factor typically varies between 10% and 25% of the direct construction cost subtotal, depending on the size of the project and market conditions, with larger projects typically having lower O&P factors. For this Systems Evaluation, an O&P factor of 20% was used.
- **Estimating Contingency –** The estimating contingency is defined as unknown costs due to lack of detailed engineering during the planning phase that are estimated as a percentage of defined project costs (i.e. direct and indirect construction cost subtotal). For this Systems Evaluation, a contingency factor of 30% was used since the projects are at conceptual planning level.

The estimated total construction cost is then multiplied by an allowance of 25% for Engineering, Permitting, Construction Management, and Engineering Services during Construction.

4.4.2 Dry Creek WWTP Cost Estimates

The proposed Phase 1 and 2 improvements and process unit cost estimates in TM 4b were used as the basis of the cost estimate. Several revisions and updates were made to the TM 4b improvements to develop the new phased improvements list and cost estimates in this Systems Evaluation, including the following:

- **Influent Pump Station –**Several improvements have been completed at East Roseville influent pump station including installation of new pumps and emergency generator, demolition of the old East Roseville Pump Station and Pump Station Annex, and replacement of PLCs. Therefore, TM 4b Phase 1 improvements were updated to remove the influent pump installation.
- **Influent Coarse Screen –** The existing two coarse screens have a PHWWF capacity of 30 mgd each. The existing screens provide sufficient capacity through buildout with project PHWWF of 54.7 mgd with two screens in service and using the existing bypass channel in the event that one of the screens is out of service. Therefore, it is recommended that a third screen be installed in Phase 2.
- **Aeration Tanks –** TM 4b proposed installation of ten new aeration tanks including replacement of four of the exiting smaller size aeration tanks constructed in 1974 with larger tanks (same size as tanks constructed in 1991) in Phase 1. The CH2M Hill, 2008 report evaluation indicated existing aeration basin volumes were sufficient for Phase 1 improvements which assumed a projected AA BOD loading capacity about the same as the current plant loading and recommended providing additional aeration and mixed liquor recycle (MLR) pumping capacity. New MLR pumps were installed at the plant per the Nitrate Removal Project Basis of Design Report (B&C, 2017). A rough evaluation of the aeration tank sizes indicated that replacement of two aeration tanks and construction of two new ones (total of four) in Phase 1 and replacement of the remaining 2 aeration tanks and construction of 4 new ones in Phase 2 (total of six) would provide sufficient capacity at each of the 2 phases.
- **Capacity Increase Adjustment Factor –** Biological treatment capacity increases for AA BOD loading were used to calculate the DCWWTP adjustment factor. The Adjustment Factor was obtained from the ratio between incremental capacity increases proposed in TM 4b and in this TM.

  BOD loading increase in Phase 1 based on TM 4b was 10,500 lb/day and the required capacity increase per this TM is 11,100. An adjustment factor of 1.06 was calculated and applied to the number of units.

  BOD loading increase in Phase 2 based on TM 4b was 13,700 lb/day and the required capacity increase per this TM is 12,000 lb/day. An adjustment factor of 0.88 was calculated and applied to the number of units.

The preliminary phased improvements are provided in **Table 4-10.** The listed improvements increase the plant ADWF capacity based on AA BOD loading from 11.5 mgd to 14.5 mgd in Phase 1 and to 18 mgd in Phase 2. It should be emphasized that the cost estimates provided below are conceptual level costs for capacity expansion projects and do not include rehabilitation and replacement projects or discretionary projects. More detailed cost estimating should be developed when the plant capacity is determined, and phased improvement projects are updated accordingly.

Table 4-10: DCWWTP Phase 1 and Phase 2 Capital Cost Estimates (ENR CCI: 12115)[a]

Process	Process Unit Cost	Phase 1 FY 24/25	Phase 2 FY 39/40
		# of units	# of units
Coarse Screens	$280,000	-	1
Influent Pump Station	$2,000,000	-	1
Fine Screens	$170,000	2	1
Odor Control	$210,000	1	1
Grit Basins	$290,000	-	1
Primary Sedimentation	$3,400,000	-	2
Aeration Basins	$2,600,000	4	6
Blower	$290,000	1	-
Mixed Liquor Return Pumps	$150,000	4	6
Rehab Existing Anoxic Zones	$290,000	1	
Secondary Clarifiers	$4,100,000	4	2
RAS/WAS Pump Station	$860,000	1	1
Tertiary Filtration	$730,000		2

UV Disinfection	$2,100,000		1
Anaerobic Digesters	$3,300,000	1	1
Centrifuges	$650,000	2	
Cooling Units	$290,000		2
Total Unit Process Costs		**$34,000,000**	**$43,000,000**
Site Yard Piping & Mechanical (5%)		$1,700,000	$2,200,000
Site Electrical / I&C/SCADA (15%)		$5,100,000	$6,500,000
Site Civil (5%)		$1,700,000	$2,200,000
Subtotal of Direct Construction Costs		**$43,000,000**	**$54,000,000**
Mobilization/Demobilization (5%)		$2,200,000	$2,700,000
Contractor Overhead & Profit (20%)		$8,600,000	$10,800,000
Subtotal of Direct and Indirect Costs		**$54,000,000**	**$68,000,000**
Contingency (30%)		$16,000,000	$20,000,000
Total Estimated Construction Cost		**$70,000,000**	**$88,000,000**
Engineering, Permitting, CM, ESDC (25%)		$18,000,000	$22,000,000
Total Estimated Capital Cost		**$88,000,000**	**$110,000,000**

Notes:

a. Costs based on Average of SF and "20 Cities" ENR for April 2020: 12115

4.4.3 PGWWTP Cost Estimates

The proposed Phase 1 and 2 improvements and cost estimates in TM 4b were used as the basis of the cost estimate. Several revisions and updates were implemented on these proposed improvements for Phase 1 and Phase 2 to develop the new phased improvements cost estimates, including the following:

- **Current Expansion –** As described in 1.2, several improvements are currently being constructed at PGWWTP per the Pleasant Grove Wastewater Treatment Plant Expansion BODR (Kennedy/Jenks, 2016). Therefore, TM 4b Phase 1 improvements were updated by removing the current expansion projects from Phase 1 scope, including the following:
    - Installation of four new primary sedimentation basins
    - Installation of 1 odor control system
    - Installation of 2 new solid thickening systems and building
    - Installation of 2 new digesters and building
    - Installation of 1 new co-generation system
- **Hydraulic Capacity Increase –** Proposed Phase 1 improvements in this TM are to increase PGWWTP peak day hydraulic capacity. Therefore, proposed projects in Phase 1 improvements in TM 4b were revised to include only improvements to unit process that increase the plant hydraulic capacity and the remaining projects associated with BOD removal capacity including installation of one digester and one oxidation ditch, and construction of associated buildings were moved to Phase 2 improvements .
- **Capacity Increase Adjustment Factor –** For Phase 1, since only hydraulic capacity increase is required, an Adjustment Factor was obtained from the ratio between the hydraulic capacity increase in TM 4b and in this TM. Both TMs propose 3 mgd hydraulic capacity increases in Phase 1, therefore the adjustment factor of 1 was multiplied by the number of units proposed in TM 4b.

  For Phase 2, biological treatment capacity increases for AA BOD loading were used. The Phase 2 BOD loading capacity increase in TM 4b was 21,000 lb/day and the proposed capacity increase in this TM is 3,500 lb/day. An adjustment Factor of 0.17 was calculated from TM 4b and proposed capacity increase ratio and was multiplied by the number of units proposed in TM 4b.

  An adjustment factor was not applied to building modifications.

The updated opinion of probable cost for the phased improvements is provided in **Table 4-11**. The recommended phased improvements increase the plant ADWF capacity from 12 mgd to 15 mgd in Phase 1 and from 15 mgd to 18 mgd in Phase 2. It should be emphasized that the cost estimates provided below are conceptual level costs for capacity expansion projects and do not include rehabilitation and replacement projects or discretionary projects. More detailed cost estimating should be developed when the plant capacity is determined, and phased improvement projects are updated accordingly.

Table 4-11: PGWWTP Phase 1 and Phase 2 Capital Cost Estimates (ENR CCI: 12115)[a]

Process	Process Unit Cost	Phase 1 FY 28/29	Phase 2 FY 39/40
		# of units	# of units
Influent Pumps	$120,000	1	-
Grit Basins	$290,000	1	-
Fine Screens	$170,000	2	-
Primary Sedimentation	$3,400,000	-	1
Oxidation Ditches	$7,100,000	-	1
Secondary Clarifiers	$4,100,000	1	1
RAS/WAS Pump Station	$860,000	1	-
Tertiary Filtration	$730,000	2	1
UV Disinfection	$2,100,000	3	-
Thickeners Building Modification	$490,000	-	1
Digesters Building Modification	$490,000	-	1
Total		**$13,000,000**	**$16,000,000**
Site Yard Piping & Mechanical (5%)		$650,000	$800,000

5. CAPACITY IMPROVEMENT PROJECT SUMMARY & NEXT STEPS

Table 5-1 summarizes the capacity improvements identified in this systems evaluation. Note that the improvement needs projected for Dry Creek and Pleasant Grove WWTPs are significantly larger and more expensive than the improvement projects projected for the collection system, but are based on limited available data. The estimated costs for Dry Creek WWTP are especially high because of the size and age of that plant; when it was designed, the organic loading in Roseville was far lower than when Pleasant Grove was designed; since the mid 2000's organic loading to both plants has continued to increase. Further studies, as described in Chapter 4, should be undertaken for both treatment plants, and the capacity improvement projects should be refined based on those findings.

Note that only capacity improvement projects have been identified; condition and reliability related improvement needs have not been evaluated in this study.

Table 5-1: Proposed Capacity Improvement Projects

		Existing	FY 24/25	FY 39/40	After FY 59/60
Collection System	**Description**	Improvement Project 1 (Increased Capacity of PS 26 and sewers on Sierra College Blvd)	None	None	Improvement Project 2 (Redirect flows from PS 26 and Sierra College Blvd down Eureka Road) Improvement Project 3 (Increased Firm capacity of PS 25 with diversion structure improvements)
	Estimated Capital Cost	$1,610,000	-	-	$2,590,000
Dry Creek WWTP	**Description**	Plant Capacity Analysis, Condition Assessment, and Facilities Plan	Phase 1 (Increase AA BOD Capacity to ~45,000 lbs/day)	Phase 2 (Increase AA BOD Capacity to ~57,000 lbs/day)	Phase 3: Increase BOD Capacity and Hydraulic Capacity (not estimated)
	Estimated Capital Cost	$550,000	$88,000,000	$110,000,000	Not Estimated
Pleasant Grove WWTP	**Description**	Plant Capacity Analysis, Condition Assessment, and Facilities Plan	Increase ADWF hydraulic capacity to 15 mgd	Increase ADWF hydraulic capacity to 18 mgd. Increase AA BOD Loading Capacity to 38,000 lbs/day	Phase 3: Increase BOD Capacity and Hydraulic Capacity (not estimated)
	Estimated Capital Cost	$450,000	$33,000,000	$41,000,000	Not Estimated

5.1 Next Steps

Based on the findings of this preliminary evaluation, and discussions with the project team, the following next steps are recommended for consideration by SPWA:

- Conduct an analysis of process performance and current biological treatment and hydraulic capacity at both DCWWTP and PGWWTP. This will likely require process-specific sampling and development of calibrated process models. Biological treatment capacity should consider both BOD and nitrate plus nitrite permit limitations set forth within each plant's respective NPDES permit. Results of this study should determine a capacity rating for each unit process at the plant and the limiting processes. This analysis will provide a sound basis for the planning of new facilities and is integral to determining required future capital improvement projects during phased expansions. It is recommended that DCWWTP capacity analysis take precedence over PGWWTP considering DCWWTP is currently operating well beyond its nominal BOD removal capacity.

- Review previous condition assessment work conducted on the plant assets and perform additional assessment needed to identify and prioritize repair and replacement (R&R) projects. This effort would include a risk assessment to identify likelihood of failure and criticality of each asset. Results of this study would identify R&R projects which may need to be implemented prior to or concurrent with phased expansions.

- Based on the capacity analysis and R&R project planning, develop Facilities Plans for DCWWTP and PGWWTP. Considering both plants are running at or above their nominal design capacities, it is recommended that facilities planning begin immediately after the capacity analysis. This effort would evaluate various process optimization steps and upgrade alternatives and provide recommended improvements for phased expansions. The Facilities Plans would include review of the 190 gpd/EDU flow factor that is critical to the timing and magnitude of any hydraulic capacity improvements.

- Develop Class 4 cost estimates for recommended improvements at the WWTPs under each expansion phase and for R&R projects to assist SPWA partners in assessing capital needs in the future.

- For the collection system, periodically update the model network based on any configuration changes, perform re-calibration to confirm the actual and anticipated flows, and to update future loads into the model network. An update frequency of every 5-10 years is recommended, depending on changes in development planning and/or system configuration.

We also recommend that SPWA evaluate funding and financing options to support implementation of the recommended capital improvements, especially Phase 1 at Dry Creek, given its size and relative immediacy. With the implementation of the steps above, and the ongoing high level performance of the SPWA Regional System, SPWA will be able to continue its excellent level of service to the Regional Partners.

APPENDIX A – PLACER COUNTY GENERAL PLAN DENSITIES

General Plan Designation	Maximum Density (EDU/Acre)	Diurnal Profile
Commercial	21	Commercial
Greenbelt & Open Space	0	Residential
High Density Residential 4 - 10 DU/Ac.	10	Residential

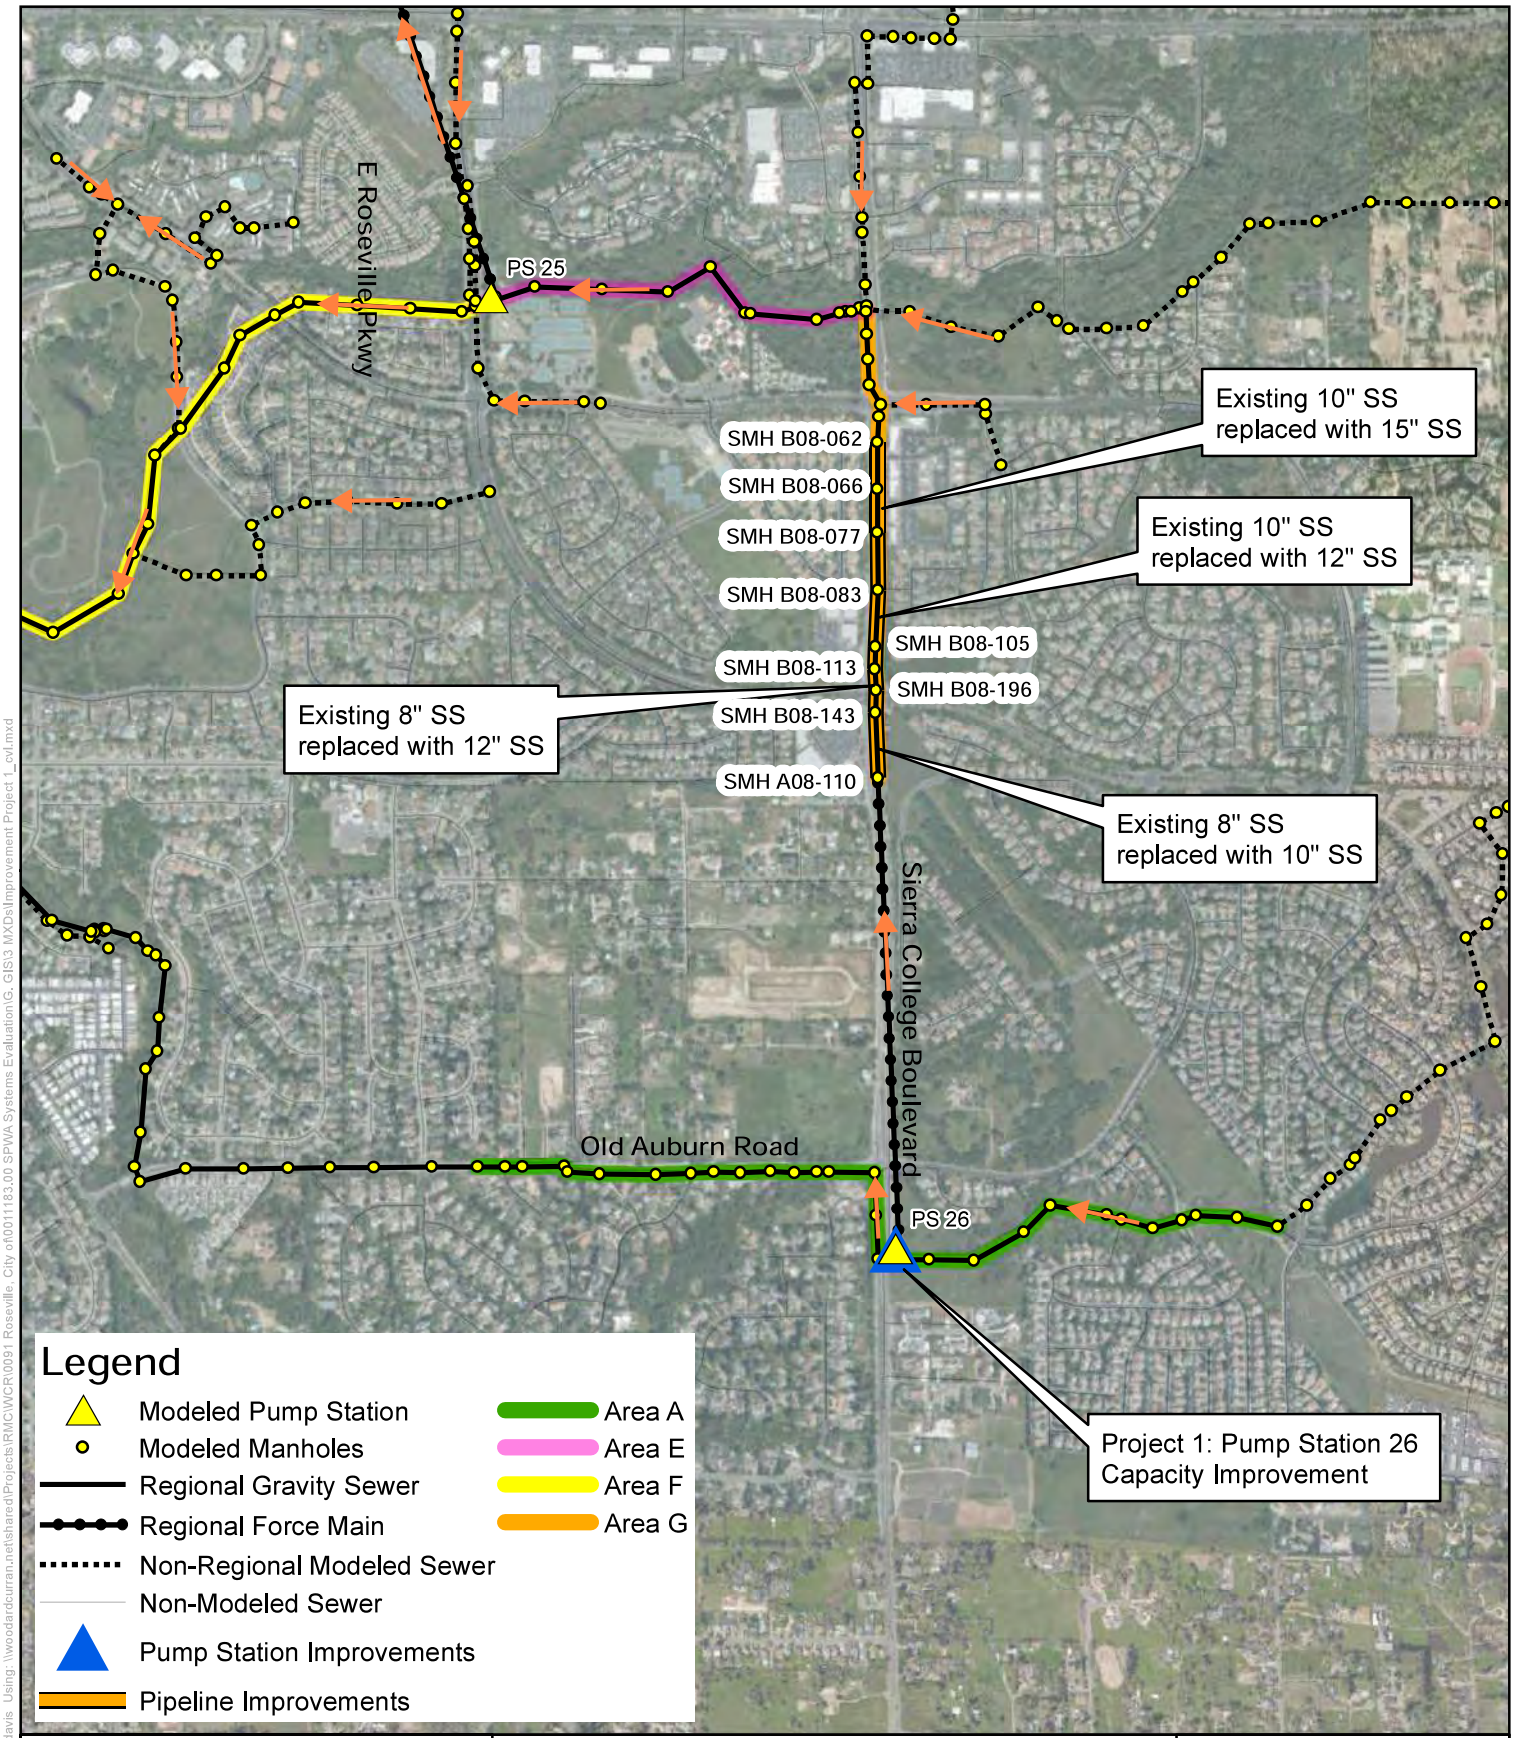
APPENDIX F – PROPOSED CAPACITY IMPROVEMENT PROJECT DETAILS



Project 1: Pump Station 26 Capacity Improvement and Sierra College Blvd. Improvement

PROJECT DESCRIPTION

Project ID	1
Project Name	Pump Station 26 Capacity Improvement and Sierra College Blvd. Improvement
Project Location	PS 26 and Sierra College Boulevard
Description	Increased Capacity of PS 26 and sewers on Sierra College Blvd (from 0.43 to 1.6 mgd)
Estimated Capital Imp. Cost	$1,606,000
Comments	(i) Pipes are listed in order from upstream to downstream
Assumptions	(i) Pipe cost estimates are based on the 20 Cities & SF Average April 2020 ENR CCI of 12115
	(ii) Cost assumes project will be implemented using open-cut construction method

PROJECT COST DETAIL

U/S MH ID	D/S MH ID	Existing Diameter (inches)	New Diameter (inches)	Length (feet)	Slope (%)	Pipe Depth (feet BGL)	Construction Method	Unit Cost ($/LF)	Total Cost ($)

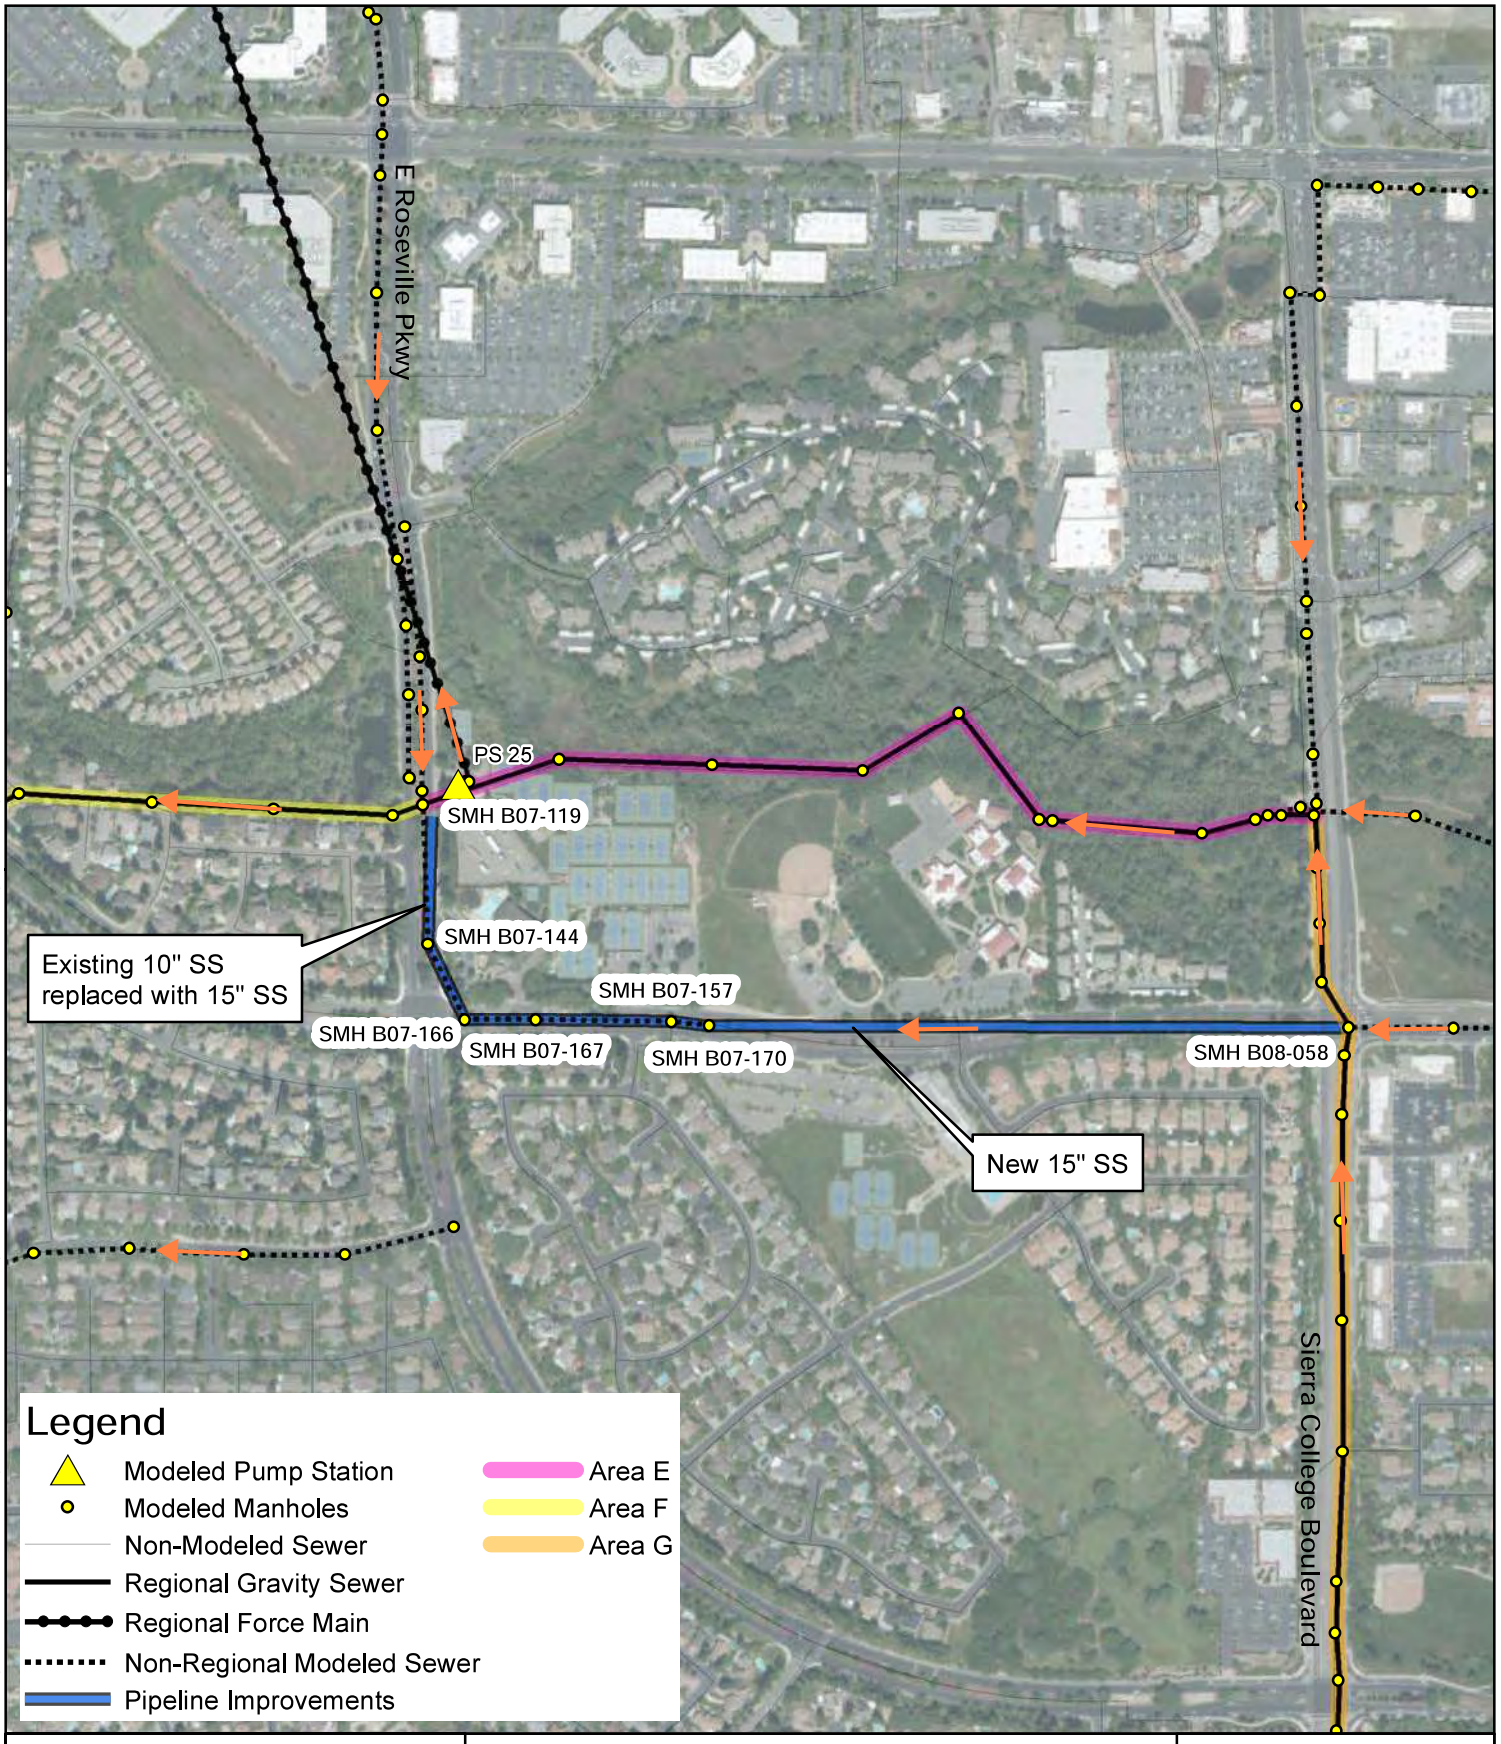
Project 2: Eureka Road, E Rosevville Parkway Improvement



PROJECT DESCRIPTION

Project ID 2
Project Name ..... Eureka Road, E Rosevville Parkway Improvement
Project Location ..... Eureka Road and E. Roseville Parkway
Description ..... Redirect flows from PS 26 and Sierra College Blvd. down Eureka Rd via upsizing of approximately 1,310ft, installing approximately 2,740 ft of new 15in pipe and 4 new manholes.

Estimated Capital Imp. Cost $1,831,000
Comments ..... (i) Pipes are listed in order from upstream to downstream
Assumptions ..... (i) Cost estimates are based on the 20 Cities & SF Average April 2020 ENR CCI of 12115
(ii) Cost assumes project will be implemented using open-cut construction method

Appendix J – 2015 USBR Record of Decision

RECLAMATION

Managing Water in the West

Record of Decision

Central Valley Project Municipal and Industrial Water Shortage Policy

Prepared by

United States Department of the Interior
Bureau of Reclamation
Mid Pacific Region

U.S. Department of the Interior
Bureau of Reclamation
Sacramento, California

November 2015

Mission Statements

The mission of the Department of the Interior is to protect and provide access to our Nation's natural and cultural heritage and honor our trust responsibilities to Indian Tribes and our commitments to island communities.

The mission of the Bureau of Reclamation is to manage, develop, and protect water and related resources in an environmentally and economically sound manner in the interest of the American public.

Record of Decision

Central Valley Project Municipal and Industrial Water Shortage Policy

Recommended:

Richard J. Woodley
Regional Resources Manager
Mid-Pacific Region

Date Nov. 4, 2015

Concur:

Date 11/13/15

Summary of Action

The Bureau of Reclamation (Reclamation) prepared the Central Valley Project (CVP) Municipal and Industrial (M&I) Water Shortage Policy (WSP) Environmental Impact Statement (EIS) to evaluate the potential impacts of CVP M&I WSP alternatives. The M&I WSP would be used by Reclamation to: 1) define water shortage terms and conditions for applicable CVP water service contractors, as appropriate; 2) determine the quantity of water made available to CVP water service contractors from the CVP that, together with the M&I water service contractors' drought water conservation measures and other non-CVP water supplies, would assist the M&I water service contractors in their efforts to protect public health and safety (PHS) during severe or continuing droughts; and 3) provide information to CVP water service contractors for their use in water supply planning and development of drought contingency plans. The alternatives evaluated in this EIS utilize different methodologies for allocating available CVP water supplies to CVP water service contractors during a Condition of Shortage[1]. This EIS evaluates potential impacts of the M&I WSP over a 20-year period, 2010 through 2030. Reclamation's decision is the adoption of an updated M&I WSP.

Background

In January 1993, following the adoption of the Central Valley Project Improvement Act (CVPIA), many CVP M&I water service contractors expressed concerns regarding future allocations of water supplies provided by the CVP. Reclamation subsequently initiated an effort to develop an M&I WSP that would be incorporated into long-term water service contracts during the contract renewal process implemented under the CVPIA. Involved stakeholders submitted language for the M&I WSP as part of several proposed policies. In September 2001, Reclamation released a Draft M&I WSP. Reclamation initiated the preparation of an Environmental Assessment (EA) which included stakeholder input and consideration and evaluation of alternative policies developed in 1993, 1996-1997, and 2000-2001. The M&I WSP EA was released in October 2005 and a Finding of No Significant Impact was signed in December 2005. The M&I WSP currently being implemented by Reclamation is the 2001 Draft M&I WSP, as amended by Alternative 1B from the 2005 EA. Because the assumptions supporting the 2005 EA became outdated and due to significant changes in the Sacramento-San Joaquin River Delta (Delta) and CVP/State Water Project (SWP) operations, Reclamation decided in 2009 to

[1] "Condition of Shortage" is defined in Reclamation water service contracts as "...a condition respecting the Project during any Year *(March 1 through February of the following year)* such that the Contracting Officer is unable to deliver sufficient water to meet the Contract Total".

undertake the M&I WSP EIS to provide an updated M&I WSP that best recognizes the needs of various segments of the water user community and how those needs could be addressed under Conditions of Shortage.

Decision

Reclamation's decision is to implement Alternative 4, Updated M&I WSP (Preferred Alternative). This alternative comprises the updated M&I WSP developed by Reclamation with stakeholder input received during the M&I WSP stakeholder workshops held between May 2010 and January 2011, with clarifying revisions made to address comments from stakeholders received after Stakeholder Workshop 4 (November 2010) and to address public comments received on the Draft EIS (March 2015). The Updated M&I WSP will apply to the CVP water service contractors noted in Table 1. These water service contractors generally comprise those whose contracts currently reference the M&I WSP and those with a water service contract that is expected to reference the updated policy. These water users are located throughout the Sacramento River Valley, San Joaquin River Valley, Tulare Lake Region, and San Francisco Bay/Central Coast area.

Alternatives Considered

No Action Alternative

The No Action Alternative represents continued implementation of the current Draft M&I WSP. This existing draft policy is currently guiding Reclamation's allocation of CVP water to agricultural and M&I water service contractors during Conditions of Shortage and would continue if none of the action alternatives were selected.

During Conditions of Shortage when the CVP is unable to deliver sufficient water to meet the CVP water service contractors' Contract Total, M&I water service contractors allocations are maintained at 100 percent of their Contract Total as the agricultural water service contractor allocations are reduced to 75 percent of their Contract Total in incremental steps. Then, M&I water service contractor allocations are reduced to 75 percent of their historical use in incremental steps as agricultural water service contractor allocations are reduced to 50 percent of their Contract Total. The M&I water service contractor allocations are maintained at 75 percent of historical use until agricultural water service contractor allocations are reduced in incremental steps to 25 percent of Contract Total. M&I water service contractor allocations are then reduced in incremental steps to 50 percent of historical use until agricultural water service contract allocations are reduced in incremental steps from 25 percent to zero.

In years when the M&I water service contractor allocations are less than 75 percent of historical use, Reclamation would attempt to provide the amount of PHS need unmet by contractors' CVP allocation and other available non-CVP

supplies, up to 75 percent of the historical use, subject to the availability of CVP water supplies. There are some years in which allocations to agricultural water service contractors are at or near zero. In those years, CVP water deliveries for unmet PHS need to M&I water service contractors may not be fully realized. Water made available to M&I water service contractors may be reduced below 75 percent of historical use and below the unmet PHS needs when CVP water is not available.

Action Alternatives

The alternatives that moved forward for more detailed analysis in the EIS were those that responded to the National Environmental Policy Act (NEPA) purpose and need, minimized negative effects, were potentially feasible, and represented a range of reasonable alternatives. As a result of initial alternatives screening, four action alternatives were selected to move forward for analysis in the EIS (in addition to the No Action Alternative). Table 2 presents the alternatives analyzed in the EIS. Analysis of these alternatives will provide the information needed for Reclamation to make a decision.

Table 2. Alternatives Analyzed in the EIS

Alternative Number	Alternative Name	Description
Alternative 1	No Action Alternative	Represents a projection of current conditions to the most reasonable future conditions that could occur during the life of the proposed action without any action alternative being implemented. The No Action Alternative represents continued allocation of water in the same way that Reclamation currently allocates CVP water to agricultural and M&I water service contractors during Conditions of Shortage, consistent with the 2001 Draft M&I WSP, as modified by Alternative 1B of the 2005 EA.
Alternative 2	Equal Agricultural and M&I Allocation	Provides no preference for either agricultural or M&I contractors. M&I and agricultural water service contractors receive equal allocation percentages during a Condition of Shortage.
Alternative 3	Full M&I Allocation Preference	M&I water service contractors receive 100% of their Contract Total until CVP supplies are not available to meet those demands. Agricultural allocations are reduced as needed to maintain 100% allocations to M&I contractors.
Alternative 4	Updated M&I WSP (Preferred Alternative)	Similar to Alternative 1 but modified to update the definition of unconstrained years used in calculating historical use. Attempts to provide unmet PHS need, but without a guarantee. Provides implementation guidelines and procedures.
Alternative 5	M&I Contractor Suggested WSP	Similar to Alternative 4 except attempts to provide a greater quantity of unmet PHS need.

Under Alternative 2, Equal Agricultural and M&I Allocation, M&I water service contractors would receive the same allocation, as a percentage of Contract Total, as the agricultural water service contractors. This means that in years when the CVP water supplies are not adequate to provide water to all water service contractors, agricultural and M&I water service contractor allocations would be reduced by the same percentage. This allocation methodology would provide a larger volume of CVP water to agricultural water service contractors than the No Action Alternative, as there would be no reductions to agricultural contractors to provide a larger volume of CVP water to M&I water service contractors. Deliveries to both north of the Delta and south of Delta M&I contractors would be lower than under the No Action Alternative in order to provide an equal allocation to agricultural water service contractors.

Under Alternative 3, Full M&I Allocation Preference, M&I water service contractors would receive a higher allocation as compared to the No Action Alternative and other action alternatives. Under this alternative, Reclamation would attempt to provide a 100 percent allocation to M&I water service contractors during a Condition of Shortage, to the extent that adequate CVP water supplies are available. This would be achieved by reducing allocations to agricultural water service contractors as needed to maximize the frequency of 100 percent allocations to the M&I water service contractors. This allocation methodology would provide the lowest volume of CVP water to agricultural water service contractors compared to the No Action and other action alternatives. Alternative 3 would have no provisions for unmet PHS needs that would be made available by Reclamation from CVP water supplies.

Alternative 4, Updated M&I WSP, is similar to the No Action Alternative. This alternative comprises the M&I WSP developed by Reclamation with stakeholder input received during the M&I WSP stakeholder workshops held between May 2010 and January 2011, with clarifying revisions made to address comments from stakeholders received after Stakeholder Workshop 4 and to address public comments received on the Draft EIS. Reclamation used this feedback to identify elements of the 2001 Draft M&I WSP (represented in the No Action Alternative) that could be improved. The major modifications made to the 2001 Draft M&I WSP that are reflected in the Updated M&I WSP include the following:

- Reclamation deleted the reference to 1996 M&I Water Rate book.
- At the M&I water service contractors' request, Reclamation modified the method that would be used to adjust an M&I water service contractor's historical use.
- Reclamation expanded the definitions of the key terms and also defined terms not previously defined, to provide greater clarity on the intent and requirements of the M&I WSP's key terms and conditions.

- Term and Condition 1 was revised to remove the sentence stating that Reclamation intended contractors to use their non-CVP supplies first and rely on CVP water as a supplemental supply. Instead, Reclamation expects water service contractors, at their discretion, to use CVP water in conjunction with their other non-CVP supplies to meet demand during all years, including years where a Condition of Shortage exists.

- Clarified M&I allocation for contracts with both irrigation and M&I use which do not set forth individual Contract Totals for each use.

Alternative 5, M&I Contractor Suggested WSP, is similar to Alternative 4, Updated M&I WSP. This alternative was developed and recommended by several M&I water service contractors who participated in the M&I WSP workshops held between May 2010 and January 2011. Alternative 5 attempts to provide an increased quantity of CVP water allocated to M&I water service contractors to supply the unmet portion of the PHS needs during a Condition of Shortage. This would be achieved by increasing the upper limit for consideration of additional allocations to assist in meeting unmet PHS need from an initial allocation of 75 percent of historical use (under Alternative 4) to an initial allocation of 95 percent of historical use (under Alternative 5).

Environmentally Preferable Alternative

Section 1505.2(b) of NEPA requires that, in cases where an EIS has been prepared, the Record of Decision must identify all alternatives that were considered, specifying the alternative or alternatives which were considered to be environmentally preferable. The environmentally preferable alternative is the alternative that will promote the national environmental policy as expressed in NEPA's Section 101. Ordinarily, this means the alternative that causes the least damage to the biological and physical environment; it also means the alternative which best protects, preserves, and enhances historic, cultural, and natural resources (Council on Environmental Quality 40 Most Asked Questions number 6(a)). It is implicit in NEPA that the environmentally preferable alternative must be reasonable and feasible to implement.

In choosing the environmentally preferable alternative, Reclamation considered impacts to all resources. On balance, Alternative 1, No Action Alternative, and Alternative 4, Updated M&I WSP, would have the least environmental effects associated with implementing a CVP M&I WSP during a Condition of Shortage. Alternative 4 would have no environmental impacts compared to the No Action Alternative. Alternatives 2 and 3 have greater environmental effects to water quality, groundwater resources, air quality, geology and soils, and agricultural resources than Alternative 4. Alternative 5 would have small but greater effects to groundwater resources and air quality compared to Alternative 4.

Basis of Decision

Reclamation's decision to move forward is based on how the alternatives meet the project's purpose and need and the magnitude of environmental effects. While the alternatives would affect different resources in different ways, Alternative 4 provides Reclamation with the greatest degree of flexibility to address CVP water service contractors' needs during Conditions of Shortage while recognizing that CVP deliveries are subject to the amount of CVP water available and cannot be guaranteed, and provides clarity to the terms, conditions, and procedures of the CVP M&I WSP. Additionally, Alternative 4 has no environmental effects compared to the No Action Alternative; therefore, no mitigation measures are necessary.

Purpose and Need

The purpose of updating the 2001 Draft M&I WSP, as amended, is to provide detailed, clear, and objective guidelines for the allocation of available CVP water supplies to CVP water service contractors during a Condition of Shortage. The update to the M&I WSP is needed by water managers and CVP water service contractors to help them better plan for and manage available CVP water supplies, and to better integrate the use of CVP water with the use of other available non-CVP water supplies. The update to the M&I WSP is also needed to clarify certain terms and conditions with regard to the applicability and implementation process of the M&I WSP.

The updated M&I WSP would be used by Reclamation to:

- Define water shortage terms and conditions for applicable CVP water service contracts, as appropriate;
- Determine the quantity of water made available to CVP water service contractors from the CVP, that together with the M&I water service contractors' drought water conservation measures and other non-CVP water supplies, would assist the M&I water service contractors in their efforts to protect PHS during severe or continuing droughts; and
- Provide information to CVP water service contractors for their use in water supply planning and development of drought contingency plans.

All action alternatives meet the purpose and need, but the No Action Alternative does not meet the purpose and need.

Environmental Issues Evaluated

During March 2011, public scoping sessions on the development of the CVP M&I WSP EIS were held in Sacramento, Willows, Fresno, and Oakland, California. Key issues raised during the public scoping process that are applicable for inclusion in the EIS are listed below.

- The final M&I WSP should be a single document that clearly states how Reclamation interprets and implements the M&I WSP.
- Any additional water provided to M&I water service contractors is viewed as water "taken" from agricultural contractors.
- M&I water service contractors would like a guaranteed quantity of CVP water to meet PHS needs and do not want their use of non-CVP supplies to count against their deliveries of CVP water in Conditions of Shortage.
- The analysis should use an appropriate baseline given ongoing regulatory issues regarding CVP/SWP operations.
- The effects analysis should include a cumulative impact discussion in the context of other reasonably foreseeable past, present, and future actions potentially affecting the allocation of CVP water, including the Bay Delta Conservation Plan.
- The EIS should analyze the impacts to water service contractors who have limited access to alternative water supplies and to "mixed use" contractors.
- The M&I WSP EIS should specifically state the agencies that are and are not affected by the policy, and state that the M&I WSP will apply equally to all M&I contractors, including the American River Division contractors.
- Certain American River Division contractors (City of Roseville, Placer County Water Agency, Sacramento Municipal Utility District, and San Juan Water District) disagree with Reclamation's interpretation of Term 14 of State Water Resources Control Board Decision 893 and believe it should provide them with additional supply reliability beyond what the M&I WSP provides in their water service contracts.

The alternatives were evaluated to address issues raised and potential impacts to the range of environmental and socioeconomic resources relevant to NEPA. The action alternatives have the potential to result in impacts to several resources, including surface water, water quality, groundwater, geology and soils, air quality, greenhouse gases (GHGs) and climate change, agricultural

resources, socioeconomics, and power[2]. The differences between the action alternatives for these impacts include:

- *Surface Water*: Alternative 2 would increase CVP deliveries to agricultural water service contractors and decrease CVP deliveries to M&I water service contractors, compared to the No Action Alternative. Alternative 3 would decrease CVP deliveries to agricultural water service contractors and increase CVP deliveries to M&I water service contractors, compared to the No Action Alternative. Alternatives 4 and 5 would have no change in CVP deliveries compared to the No Action Alternative. PHS needs would be met for the Sacramento River Division under all alternatives. The American River, Delta, and San Felipe Divisions would have unmet PHS needs under Alternative 2. There would be unmet PHS needs for the Shasta/Trinity River and West San Joaquin Divisions under Alternatives 2, 3, and 4. The Cross Valley Canal Unit would have unmet PHS needs under all alternatives.

  There are only relatively small to no changes to Shasta and Trinity lakes storages, upper Sacramento River flows, and Lake Oroville storage as a result of action alternatives, which do not result in substantial impacts. The effects of changes to other reservoirs' storage and rivers' flows are addressed under other appropriate resource areas (e.g., water quality, recreation, flood hydrology, water quality, etc.).

- *Water Quality:* Changes in CVP deliveries could affect the salinity and bromide concentrations in the Delta Division. Alternative 5 would have only very minimal changes in reservoir or river flows compared to the No Action Alternative that would not affect salinity and bromide concentrations. Alternatives 2 and 3 would cause an increase in electrical conductivity which could affect water quality in the Delta Division.

- *Groundwater*: A reduction in CVP deliveries to agricultural water service contractors could cause these contractors to supplement their surface water supplies through increased groundwater pumping. Alternative 2 would reduce agricultural groundwater pumping in all regions due to increases in CVP deliveries to agricultural water service contractors, while Alternative 3 would increase agricultural groundwater pumping in all regions due to decreases in CVP deliveries to agricultural contractors. M&I water service contractors may need to make use of all their available groundwater supplies under Alternative 2 in order to meet PHS needs in certain years. Alternatives 4 and 5 would have little to no change in groundwater pumping by CVP water service contractors compared to the No Action Alternative.

[2] It was determined that no impacts or only minor impacts would occur to aquatic resources, terrestrial resources, environmental justice, cultural resources, Indian sacred sites, recreation, flood hydrology, and visual resources.

Increased pumping caused by change in deliveries to supplement supply shortages may cause groundwater level declines that could lead to land subsidence. Alternative 2 would cause a net increase in pumping that could potentially increase land subsidence in the San Francisco Bay/Central Coast region. Alternative 3 would cause a net increase in pumping that could potentially increase land subsidence in the Sacramento Valley, San Joaquin Valley, and Tulare Lake regions.

- *Geology and Soils:* Under Alternative 3, reduced CVP deliveries to agricultural water service contractors could indirectly lead to wind erosion if agricultural water service contractors implement crop idling to manage their water supplies.

- *Air Quality*: Increases in CVP deliveries to agricultural water service contractors under Alternative 2 would result in decreased pollutant emissions from reduced groundwater pumping. Decreases in CVP deliveries to agricultural water service contractors under Alternative 3 would result in increased pollutant emissions due to increased groundwater pumping. Under Alternative 3, the general conformity *de minimis* threshold would be exceeded in the San Joaquin Valley Air Basin. Alternatives 4 and 5 would have little to no changes compared to the No Action Alternative.

- *GHGs and Climate Change:* Changes in CVP deliveries to agricultural water service contractors would decrease GHG emissions under Alternative 2 and increase GHG emissions under Alternatives 3 and 5. Alternative 4 would have no change compared to the No Action Alternative.

- *Agricultural Resources*: Alternative 3 would reduce agricultural acreage primarily in the Tulare Lake Region, but minimally to other regions in the study area.

- *Socioeconomics*: Changes in CVP deliveries for CVP water service contractors would have differing effects for agricultural and M&I water service contractors in Alternatives 2 and 3. Generally, effects would be positive for agricultural water service contractors under Alternative 2 and negative under Alternative 3, while the opposite would be true for M&I water service contractors. Alternatives 4 and 5 would have no change compared to the No Action Alternative.

- Power: Changes in CVP deliveries may cause changes in power generation from hydroelectric power generation facilities by changing reservoir releases or by changing reservoir storage, as represented by changes in reservoir elevations. Alternative 2 and 3 would experience minimal reductions to the amount of power generated at the Folsom and Nimbus power plants and slight fluctuations in the amount of

power generated at San Luis Reservoir. Alternatives 4 and 5 would have no change compared to the No Action Alternative.

- *Indian Trust Assets*: Under Alternatives 2 and 3, the magnitudes of groundwater level fluctuations are very small compared to overall groundwater supplies and would not be substantial enough to create a noticeable change to water supply at existing wells near Indian Trust Asset sites. Therefore, Alternatives 2 and 3 would not interfere with the exercise of federally-reserved water rights and/or reduce the health of tribal members by decreasing water supplies. Alternatives 4 and 5 would have no change compared to the No Action Alternative, and would not result in impacts to Indian Trust Assets.

Section 7 of the Federal Endangered Species Act (ESA)

Reclamation coordinated with the U.S. Fish & Wildlife Service during development of the Draft EIS regarding the impact analysis on special status species and environmental commitments. Reclamation further coordinated with National Oceanic and Atmospheric Administration National Marine Fisheries Service in preparing the Final EIS. A full consultation under Section 7 of the ESA with U.S. Fish & Wildlife Service or National Oceanic and Atmospheric Administration National Marine Fisheries Service was determined not to be needed for this action because the potential impacts are within the range of impacts already observed under current operations of the CVP and are covered by the Biological Opinions on the Coordinated Long-Term Operations of the CVP and SWP.

Section 106 Compliance

Reclamation is responsible for complying with Section 106 of the National Historic Preservation Act. Alternative 4 would not result in the disturbance of land or require any construction activities; therefore, there are no impacts to cultural resources. Under Section 106 of the National Historic Preservation Act, Alternative 4 is the type of activity that does not have the potential to affect historic properties and there are no further obligations under Section 106 [36 Code of Federal Regulations Sec. 800.3(a)(1)].

Comments Received on the Final EIS

Reclamation's Notice of Availability of the Final EIS was published in the Federal Register on September 10, 2015, and the Environmental Protection Agency's Notice of Availability was published on September 18, 2015. The EIS was posted on Reclamation's website, and copies were distributed to those who requested a copy. A press release was released on September 10, 2015, and was sent to participants in public meetings and commenters on the Draft EIS.

Reclamation received comments from three entities after release of Final EIS. The commenters were: Somach Simmons & Dunn for Glenn-Colusa Irrigation District (Kelley Taber); East Bay Municipal Utility District (Michael Tognolini); and Santa Clara Valley Water District (Cindy Kao). These comments either reiterated comments previously provided during the public comment period, or supported Reclamation's choice of the Preferred Alternative. Reclamation had adequately addressed the previous comments in the Final EIS. The comments consisted of the following:

- Glenn-Colusa Irrigation District (GCID) did not agree that their comments on the Draft EIS were adequately addressed in Appendix I of the Final EIS. GCID was concerned that the M&I WSP's definition of PHS is too broad and would allow a greater amount of water than necessary for domestic use and essential public services to be included in the calculation, thereby overestimating system demands during Conditions of Shortage and influencing the allocation of water within the CVP system. Additionally, GCID was concerned that implementation of the M&I WSP could affect water supply reliability under their Settlement Contract. As described in the Final EIS, the determination of any additional CVP water supplied to M&I water service contractors during a Condition of Shortage to assist in meeting PHS needs would take into account a contractor's estimated PHS demand, as well as their non-CVP supplies available in that year, and, most importantly, the availability of CVP water in that year. Reclamation would closely review the data provided by an M&I water service contractor so that CVP water provided for PHS needs is estimated in accordance with California criteria and used appropriately during a Condition of Shortage. The Final EIS also states in Appendix B that Reclamation does not have discretion to determine water supply allocations to Sacramento River Settlement Contractors, San Joaquin River Exchange Contractors, certain named State Wildlife Areas and National Wildlife Refuges, and the privately owned/managed wetlands comprising the Grassland Resources Conservation District as identified under the CVPIA Section 3406(d). Water supply allocations for these water service contractors are determined annually based on the forecasted full natural inflow to Shasta Lake. CalSim II simulates

water supply allocations to these water service contractors based on inflow to Shasta Lake.

- East Bay Municipal Utility District (EBMUD) supports Reclamation's selection of Alternative 4 as the Preferred Alternative for the M&I WSP. However, EBMUD requested that their contractual historic use of 133,000 acre-feet (AF), per their Long Term Renewal Contract, be noted in the M&I WSP as an exception to the methodology used for calculating historical use. Reclamation, when applying the M&I WSP to EBMUD, would use EBMUD's contractual historic use of 133,000 AF as the basis for making adjustments for population growth, extraordinary water conservation measures, and use of non-CVP water supplies. But, Reclamation believes it inappropriate to specifically state or call out such an exception in the M&I WSP.

- Santa Clara Valley Water District (SCVWD) supports Reclamation's selection of Alternative 4 as the Preferred Alternative for the M&I WSP. SCVWD believes an adopted M&I WSP is critically important for water supply reliability in support of the communities and businesses in its service area.

Water Shortage Contingency Plan

Following the severe drought of 2012-2016, the State of California Legislature sought to expand the water shortage contingency analysis under former law and mandated that a water shortage contingency plan (WSCP) be adopted by suppliers. The California Water Code (CWC) recognizes WSCPs as a critical tool during a drought emergency and grants that the State defer to locally adopted WSCPs, to the extent practicable.

> *California Water Code Section 10632.3*
>
> *It is the intent of the Legislature that, upon proclamation by the Governor of a state of emergency under the California Emergency Services Act (Chapter 7 (commencing with Section 8550) of Division 1 of Title 2 of the Government Code) based on drought conditions, the board defer to implementation of locally adopted water shortage contingency plans to the extent practicable.*

The WSCP is the City of Roseville Water Utility's (City's) operational plan in the event of a water shortage. Water shortage would occur when available water supplies are insufficient to meet normal customer water demands. Various causes can bring about a water shortage including population growth, climate change, drought, natural disasters, and catastrophic events.

The WSCP shall address the ten following elements:

1. Water supply reliability assessment analysis
2. Annual assessment procedures
3. Six standard shortage stages
4. Shortage response actions
5. Communication protocols
6. Compliance and enforcement
7. Legal authorities
8. Financial consequences of WSCP
9. Monitoring and reporting
10. WSCP refinement procedures

1.1 Water Supply Reliability Analysis

Pursuant to 10632(a)(1) of the CWC, a near-term (5years) and long-term (20 years) water supply reliability analysis is provided herein. The water supply reliability analysis consists of a water service reliability assessment and drought risk assessment (DRA).

1.1.1 Constraints on Water Supply

Most of the City's water is surface water received from Folsom Lake. The City's existing surface water contracts with the U.S. Bureau of Reclamation (USBR), Placer County Water Agency (PCWA), and San Juan Water District (SJWD) are received through the Folsom Dam Diversion, making this a critical facility for the reliability of Roseville's surface water supply. Under normal conditions, the capacities of the Folsom Dam Diversion, Roseville Water Treatment Plant, and distribution network are sufficient to meet the City's water demands. However, the water that the City receives is subject to reductions during dry years pursuant to the Water Forum Agreement, the USBR

Operations Criteria and Plan (OCAP), and the Central Valley Project Municipal and Industrial Water Shortage Policy (CVP M&I WSP).

Although Roseville's annual water contract entitlements total 66,000-acre feet (AF), the City along with other Sacramento-area water suppliers are signatory to the January 2000 Water Forum Agreement (updated in 2015), which includes Purveyor Specific Agreements. The City's Purveyor Specific Agreement includes limitations on City surface water diversions from the American River under different hydrologic conditions. The hydrologic conditions are characterized by three categories of year type and the corresponding limitations for the City are given in WSCP Table 1.

WSCP Table 1 Available Surface Water Supply Under Differing Hydrologic Conditions

Year Type	Unimpaired Flow into Folsom Reservoir	Roseville Available Supply
Normal/ Average or Wet Year	Greater or equal to 950,000 AF	Maximum of 58,900 AF
Drier Year	Between 400,000 and 950,000 AF	Between 43,800 and 58,900 AF
Driest/ Critically Dry Year	Less than 400,000 AF	Maximum of 43,800 AF

In addition to the impacts of the contractual agreements, the reliability of surface water is also subject to physical constraints. In the event that the water level at Folsom Lake drops close to or below the intake elevation, without additional infrastructure, the City would be unable to divert water. The severe drought of 2015, which was preceded by multiple consecutive dry years, demonstrated the vulnerability of the City's surface water as the water elevation did come close to the intake elevation.

Though the City has begun the process of expanding its groundwater program, under current operations the groundwater is not a major source of water for the City. The City has 4 existing wells with aquifer storage recovery (ASR) injection capability. The City's strategy in normal years is to not pump groundwater from the wells in excess of what was injected, thus creating a bank of water for future use. If a significant drought stage is reached the City can pump additional water to augment its water supply and make up for deficits of the surface water supply. The City continues to invest in development of groundwater infrastructure to increase supply reliability in times of drought, however in any given year type, the City must make determinations of drought stage without consideration of groundwater supplies, per the terms of the municipal code. This is further discussed in Section 1.5. For the purpose of this WSCP, only the resources available to the City in determination of a drought stage are included in calculations of the surplus or shortfall for the DRA shown in WSCP Table 2 and WSCP Table 3.

1.1.2 Drought Risk Assessment

The near-term and long-term drought risk assessment was performed by comparing the unconstrained potable water demands to the water supply availability for a single dry year and 5 consecutive dry years. The near-term DRA for a five-year drought is provided in WSCP Table 2. The long-term single and five-year DRA is provided in WSCP Table 3. Note that while typical groundwater supplies are not considered in the calculations of Total Supplies shown in WSCP Table 2 and WSCP Table 3, the volume of groundwater that the City intends to use for each year type is listed separately.

WSCP Table 2 Near-Term Five-Year Drought Risk Assessment

Category	2021	2022	2023	2024	2025
Total Supplies	62,719	57,870	57,920	49,971	42,022
Total Gross Water Use	39,172	42,276	45,380	48,484	51,589
Surplus/ Shortfall absent of WSCP Action	23,547	15,593	12,540	1,487	-9,567
Total Right/ Safe Yield Groundwater Supplies	1,560	1,560	1,560	1,560	7,920
NOTES: All values are in AF. Groundwater supplies are not included in calculation of surplus/ shortfall.					

WSCP Table 3 Long-Term Single and Five-Year Drought Risk Assessment

Drought Type/ Year	Category	2025	2030	2035	2040	2045
Single Year	Total Supplies	42,022	42,435	46,293	46,293	46,293
	Total Gross Water Use	51,589	56,990	62,547	62,547	62,547
	Surplus/ Shortfall absent of WSCP Action	-9,567	-14,555	-16,254	-16,254	-16,254
	Total Right/ Safe Yield Groundwater Supplies	7,920	12,570	14,430	14,430	14,430
Year 1	Total Supplies	62,922	63,335	67,193	67,193	67,193
	Total Gross Water Use	51,589	56,990	62,547	62,547	62,547
	Surplus/ Shortfall absent of WSCP Action	11,333	6,345	4,646	4,646	4,646
	Reasonably Available Groundwater Supplies	1,560	2,720	3,350	3,350	3,350
Year 2	Total Supplies	58,022	58,435	62,293	62,293	62,293
	Total Gross Water Use	51,589	56,990	62,547	62,547	62,547
	Surplus/ Shortfall absent of WSCP Action	6,433	1,445	-254	-254	-254
	Reasonably Available Groundwater Supplies	1,560	2,720	3,350	3,350	3,350
Year 3	Total Supplies	58,022	58,435	62,293	62,293	62,293
	Total Gross Water Use	51,589	56,990	62,547	62,547	62,547
	Surplus/ Shortfall absent of WSCP Action	6,433	1,445	-254	-254	-254
	Reasonably Available Groundwater Supplies	1,560	2,720	3,350	3,350	3,350
Year 4	Total Supplies	50,022	50,435	54,293	54,293	54,293
	Total Gross Water Use	51,589	56,990	62,547	62,547	62,547
	Surplus/ Shortfall absent of WSCP Action	-1,567	-6,555	-8,254	-8,254	-8,254
	Reasonably Available Groundwater Supplies	1,560	2,720	3,350	3,350	3,350
Year 5	Total Supplies	42,022	42,435	46,293	46,293	46,293
	Total Gross Water Use	51,589	56,990	62,547	62,547	62,547
	Surplus/ Shortfall absent of WSCP Action	-9,567	-14,555	-16,254	-16,254	-16,254
	Total Right/ Safe Yield Groundwater Supplies	7,920	12,570	14,430	14,430	14,430
NOTES: All values are in AF. Groundwater supplies are not included in calculation of surplus/ shortfall.						

1.1.3 Seismic Risk Analysis

Seismic risk in California can pose a significant threat to facilities and infrastructure. The City of Roseville 2016 Multi-Hazard Mitigation Plan addresses the seismic risk at critical facilities including those dedicated to water supply and is provided in Exhibit A.

1.2 Legal Authorities

Chapter 14.09 Water Conservation of the Roseville Municipal Code (Municipal Code) also cited as Water Conservation and Drought Mitigation Ordinance (Ordinance 5311 § 2, 2014; Ordinance 2413 § 2, 1991), grants the City the authority to declare a water shortage in the City. Chapter 14.09 of the Municipal Code is provided in Exhibit B.

The purpose and scope of the Water Conservation and Drought Mitigation Ordinance as stated in the Municipal Code is provided below:

14.09.020 General provisions

A. Purpose. The purpose of this chapter is to ensure compliance with all federal, state and local requirements relating to water conservation and drought mitigation for the protection of public health, safety and welfare by:

1. Reducing the per capita water consumption throughout the City of Roseville (the "city") during years of normal precipitation and during years of drought;

2. Protecting and conserving the city's supply of water during specified times of emergency and/or crisis;

3. Minimizing and/or eliminating the waste of water through voluntary compliance or punitive action, if necessary;

4. Promoting the use of drip irrigation and other low volume irrigation methods that reduce outdoor water use by applying water more efficiently than traditional irrigation methods;

5. No person shall use, or cause to be used any city water for landscape irrigation between the hours of 10:00 a.m. and 8:00 p.m., unless the city manager, or designee provides prior written consent to a different time limitation. A waiver may be granted for turf areas if the landscape contains too many irrigation valves to complete an irrigation event within the watering window.

6. Upon city declaration of a water shortage, the city manager, or designee, may impose revised and/or additional limitations on outdoor water use, as specified in Section 14.09.040, and no person shall use, or cause to be used, city water in violation of such limitations while the water shortage remains in effect.

B. Scope. The provisions of this chapter shall apply to all customers, users and/or recipients (hereinafter "users") of the city's potable and recycled water service within the city's territorial limits.

The City's development and adoption of the WSCP upholds 14.09.020 General Provisions of the Municipal Code by ensuring compliance with state requirements.

All components of the WSCP comply with Chapter 14.09 of the Municipal Code. Any actions to be taken under the WSCP not explicitly stated in Chapter 14.09 of the Municipal Code are a further refinement of the existing ordinance.

1.3 Standard Water Shortage Levels

The California Water Code Section 10632(a)(3) defines six standard water shortage levels. Standardization of water shortage levels provide a consistent regional and statewide approach to characterizing and conveying the severity of a water shortage. However, Chapter 14.09 of the City's Municipal Code defines water shortage stages that are different from those listed in CWC. Pursuant to 10632(a)(3)(B), the six standard water shortage levels are related to the existing shortage stages in the Municipal Code in WSCP Table 4.

WSCP Table 4 Relation Between Standard Water Shortage Levels and Existing Stages

CWC Shortage Level Description	CWC Shortage Level	Municipal Code Shortage Stage	Municipal Code Water Conservation and Drought Stage Description
Up to 10%	1	Basic Stage	City's water supply is adequate to meet all projected demands
		Stage One Drought	City's water supply is adequate to meet 90% of projected demands
Up to 20%	2	Stage Two Drought	City's water supply is adequate to meet 80% of projected demands
Up to 30%	3	Stage Three Drought	City's water supply is adequate to meet 70% of projected demands
Up to 40%	4	Stage Four Drought	City's water supply is adequate to meet 60% of projected demands
Up to 50%	5	Stage Five Drought	City's water supply is adequate to meet 50% or less of projected demands
Greater than 50%	6		

1.4 Annual Water Supply and Demand Assessment Procedures

Pursuant to CWC 10632.1, all water suppliers are required to conduct an annual water supply and demand assessment on or before July 1 of each year beginning in 2022. If the supplier receives imported water from the State Water Project or the U.S. Bureau of Reclamation (USBR) they shall submit the report within 14 days of receiving final allocations or by July 1 of each year, whichever is later. The steps for conducting the Annual Water Supply and Demands Assessment are outlined in WSCP Table 5.

WSCP Table 5 Water Supply and Demand Assessment Procedure

Step	Description	Timeframe	Participants
Step 1	Request water utility data from all departments.	Jan 1 - Jan 31	Water Conservation Administrator
Step 2	Coordinate with Planning Division for any significant planned developments and project those water demands.	Jan 15 - Jan 31	Water Conservation Administrator Planning Division
Step 3	Compile water utility data into Water Utility Reporting Master spreadsheet.	Feb 1 - Feb 14	Water Conservation Administrator
Step 4	Calculate total projected unconstrained water demands for current year.	Feb 15-Feb 28	Senior Engineer – Water Utility

Step 5	Identify any constraints on facilities or infrastructure that could impact the supply of water such as planned maintenance that would take facilities offline or known damage to facilities/ infrastructure.	Feb 15-Feb 28	Hydrogeologist Senior Engineer – Water Utility Water Distribution Superintendent Water Treatment Plant Chief Operator
Step 6	Commence preparation of Annual Water Shortage Assessment Report.	March-April	Water Conservation Administrator Senior Engineer – Water Utility
Step 7	Receive final allotments from USBR for current year.	April	EU Assistant Director-Water Utility
Step 8	Subtract current year projected water demand from final allotment volume to determine shortage percentage and volume.	2 Days after notification from USBR	Senior Engineer – Water Utility
Step 9	If a shortage is identified Environmental Utilities (EU) Department is to hold an internal meeting to inform participants that a water shortage for the current year is anticipated and the extent of that shortage. Review the WSCP and Chapter 14.09 of the Roseville Municipal Code. Identify any concerns from the group regarding the ability to carry out the actions described in the WSCP and Chapter 14.09 of the Municipal Code. Assign an individual or group, among the participants, the responsibility of resolving the concern.	Within 7 days of notification from USBR	EU Director EU Assistant Director – Water Utility Hydrogeologist Water Distribution Super Intendent Water Treatment Plant Chief Operator Senior Engineer – Water Utility Water Conservation Administrator Additional participants as needed
Step 10	Inform City Manager of water shortage emergency condition.	Within 14 days of notification from USBR	City Manager EU Director EU Assistant Director – Water Utility Additional participants as needed
Step 11	Finalize and submit Annual Water Shortage Assessment Report to DWR.	By July 1 or 14 days after receiving final allocations	EU Assistant Director – Water Utility Water Conservation Administrator Senior Engineer – Water Utility
Step 11	The City Manager shall inform City Council of the water shortage emergency condition and the "Drought stage," under which the emergency falls. City Council shall declare a water shortage emergency condition to prevail within the area served by the City of Roseville Water Utility.	Within 28 days of notification from USBR	City Manager City Council Public Information Officer
Step 12	The City of Roseville shall coordinate with any city or county within which it provides water supply services for the possible proclamation of a local emergency.	Within 28 days of notification from USBR	City Manager City Council Public Information Officer

Step 13	The public, interested parties, and local, regional, and state governments shall be noticed of the water shortage emergency condition and of all water shortage response actions triggered by the emergency declaration. Pursuant to Municipal Code Section 14.09.020(E), the City Manager, or assigned designee, shall be responsible for determining the means by which water users shall be notified. Possible means for notification include mass media, newspaper, public notice, mailings, utility billings, or by any combination of such notice.	Beginning 2 business days after declaration of emergency condition and continuing for as long as the emergency condition persists.	Water Conservation Administrator Senior Engineer – Water Utility Public Information Officer
Step 14	The appropriate Water Shortage Response Actions for the drought stage, outlined in WSCP Table 6 and 7, will be carried out by the public and water utility. The City will enforce compliance in accordance with Roseville Municipal Code 14.09.	Duration of emergency condition	EU – Water Utility Water Users City Manager or designee
Step 15	Track customer water use at a minimum on a monthly basis. Ensure that total gross water use for that month, or more frequent tracking period, is reduced by the necessary percentage when compared to that same tracking period of the last normal supply year.	Duration of emergency condition	Water Conservation Administrator Senior Engineer – Water Utility
Step 16	If the needed water use reduction percentage is not met for any month determine which additional strategies or actions would result in the needed reduction.	Upon determination of insufficient water use reduction	EU Director EU Assistant Director – Water Utility Hydrogeologist Senior Engineer – Water Utility Water Conservation Administrator Additional participants as needed
Step 17	The EU Department management shall propose to the City Manager additional shortage response actions and whether or not those actions would require the WSCP and Chapter 14.09 of the Roseville Municipal Code to be changed.	Upon determination of insufficient water use reduction	City Manager EU Director EU Assistant Director – Water Utility Additional participants as needed
Step 18	If deemed necessary, the City Manager and City Council will revise the WSCP and Chapter 14.09 of the Roseville Municipal Code, observing all required procedures with such adoption.	Upon determination of insufficient water use reduction	City Manager City Council Additional participants as needed
NOTES: It is the intent of the WSCP that the Water Conservation Administrator and Water Utility Senior Engineer shall jointly be responsible for ensuring that the steps of this plan are carried out by noticing the necessary parties for data requests and facilitating meetings.			

WSCP Table 6 Demand Reduction Actions to be Implemented at Each Shortage Level

Standard Shortage Level	Roseville Municipal Code Stage	Demand Reduction Actions	Estimated Percent Reduction	Section of Water Conservation and Drought Mitigation Ordinance corresponding to Demand Reduction Action *Explanations provided as needed*	Penalty, Charge, or Other Enforcement?
1	Basic	Landscape - Restrict or prohibit runoff from landscape irrigation	0%	14.09.030(A)	Yes
1	Basic	Landscape - Limit landscape irrigation to specific times	0%	14.09.020(A)(1); No person shall use, or cause to be used, any city water for landscape irrigation between the hours of 10:00 a.m. and 8:00 p.m., unless the city manager, or designee provides prior written consent to a different time limitation. A waiver may be granted for turf areas if the landscape contains too many irrigation valves to complete an irrigation event within the watering window.	Yes
1	Basic	Landscape - Limit landscape irrigation to specific days	0%	14.09.060(E)(2); Irrigation of new landscaping shall be allowed on any day of the week for a period of 30 days after the new landscaping is planted, unless the city manager, or designee, provides prior written consent to extend this time period based on plant type and the season when the new landscaping is planted. After the 30 days, irrigation days and run times should be decreased to settings appropriate for an established landscape.	Yes
1	Basic	Landscape - Prohibit certain types of landscape irrigation	0%	14.09.030(E); Prohibit operation of an irrigation system that applies water to an impervious surface or that is in disrepair.	Yes
1	Basic	Landscape - Other landscape restriction or prohibition	0%	14.09.030(G); Prohibit irrigation of landscaping during rainfall or 48 hours after a measurable rain event.	Yes
1	Basic	Landscape - Other landscape restriction or prohibition	0%	14.090.060(E)(1); All landscaping installed in the City of Roseville shall comply with the water efficient landscape requirements adopted by resolution of the city council.	Yes
1	Basic	Other water feature or swimming pool restriction	0%	14.09.030(C); Prohibit maintaining ponds, waterways, decorative basins, or swimming pools without water recirculation devices.	Yes
1	Basic	Other water feature or swimming pool restriction	0%	14.09.030(D); Prohibit backwashing so as to discharge to waste swimming pools, decorative basins or ponds in excess of the frequency necessary to ensure the healthful condition of the water or in excess of that required by standards for professionally administered maintenance or to address structural considerations, as determined by the city manager, or designee.	Yes
1	Basic	Other water feature or swimming pool restriction	0%	14.09.030(H); Prohibit overfilling of any pond, pool or fountain which results in water discharging to waste.	Yes

1	Basic	Other - Customers must repair leaks, breaks, and malfunctions in a timely manner	0%	14.09.060(C)	Yes
1	Basic	Other - Require automatic shut off hoses	0%	14.09.060(B); Free-flowing hoses for all uses are prohibited. Automatic shut-off devices shall be attached on any hose or filling apparatus in use.	Yes
1	Basic	Other	0%	14.09.030(B); Prohibit water fixtures (including, but not limited to, toilets, faucets, shower heads) or heating or cooling devices to leak or run to waste.	Yes
1	Basic	Other	0%	14.09.030(A); Prohibit water use for washing in excess of that necessary to wash, wet or clean the dirty or dusty object, such as an automobile, sidewalk, or parking area, flows to waste.	Yes
1	Basic	Other	0%	14.09.060(A); Water shall be confined to the user's property and shall not be allowed to run off to adjoining properties, or to the roadside or to the gutter. Care shall be taken not to water past the point of saturation.	Yes
1	Basic	Other	0%	14.09.060(F); All site reviews shall include an evaluation of using recycled water. Recycled water shall be required if economically feasible.	Yes
1	Stage 1	Landscape - Limit landscape irrigation to specific days	1%	14.09.070(C) and 14.09.070(D); Residential and non-residential water users shall be permitted to irrigate with city water according to the schedule provided in 14.09.070(C) and 14.09.070(D), respectively.	Yes
1	Stage 1	Landscape - Other landscape restriction or prohibition	1%	14.09.070(G); City park sites shall, as an aggregate, reduce usage up to 10 percent.	Yes
1	Stage 1	CII - Restaurants may only serve water upon request	1%	14.09.070(I)	Yes
1	Stage 1	Other - Prohibit use of potable water for washing hard surfaces	1%	14.09.070(H); Washing streets, parking lots, driveways, sidewalks or buildings, except as necessary for health or sanitary purposes or pursuant to a term or condition in a permit issued by a state or federal agency, is prohibited.	Yes
1	Stage 1	Other	10%	14.09.070(B); Residential users and non-residential users shall reduce water usage up to 10 percent.	Yes
2	Stage 2	Landscape - Other landscape restriction or prohibition	1%	14.09.070(C); City park sites shall, as an aggregate, reduce usage up to 20 percent.	Yes
2	Stage 2	Other - Prohibit vehicle washing except at facilities using recycled or recirculating water	1%	14.09.080(H)	Yes
2	Stage 2	Other	10-18%	14.09.080(B); Residential users and non-residential landscapes shall reduce water usage up to 20 percent.	Yes

3	Stage 3	Landscape - Limit landscape irrigation to specific days	1%	14.09.090(D) and 14.09.090(E); Residential and non-residential water users shall be permitted to irrigate with city water according to the schedule provided in 14.09.090(D) and 14.09.090(E), respectively.	Yes
3	Stage 3	Landscape - Other landscape restriction or prohibition	1%	14.09.090(C); City park sites shall, as an aggregate, reduce usage up to 30 percent.	Yes
3	Stage 3	Landscape - Other landscape restriction or prohibition	1%	14.09.090(H); New or expanded landscaping is limited to drought-tolerant trees, shrubs, and groundcover and be irrigated using a low volume irrigation system. No new turf shall be planted, hydroseeded, or laid, unless prior written consent is received from the city manager. Low volume irrigation means the application of irrigation water at low pressure through a system of tubing or lateral lines and low-volume emitters such as drip or drip lines irrigating at less than two gallons per hour. These systems are specifically designed to apply small volumes of water slowly at or near the root zone of plants.	Yes
3	Stage 3	Water Features - Restrict water use for decorative water features, such as fountains	1%	14.09.090(I)	Yes
3	Stage 3	Pools - Allow filling of swimming pools only when an appropriate cover is in place.	1%	14.09.090(L)	Yes
3	Stage 3	Other - Prohibit use of potable water for construction and dust control	1%	14.09.090(K)	Yes
3	Stage 3	Other	1%	14.09.090(I); Except where recycled water is used, golf courses shall reduce irrigation up to 30 percent.	Yes
3	Stage 3	Other	18-27%	14.09.090(B). Residential users and non-residential landscapes are to reduce water usage up to 30 percent.	Yes
4	Stage 4	Landscape - Limit landscape irrigation to specific days	2%	14.09.100(D) and 14.09.100(E); Residential and non-residential water users shall be permitted to irrigate with city water according to the schedule provided in 14.09.100(D) and 14.09.100(E), respectively.	Yes
4	Stage 4	Landscape - Other landscape restriction or prohibition	1%	14.09.100(C); City park sites shall, as an aggregate, reduce usage up to 40 percent.	Yes
4	Stage 4	Landscape - Other landscape restriction or prohibition	1%	14.09.100(H); Installation of any new landscaping is prohibited unless irrigation is provided through connection to an active recycled water system. In the case of new construction, the city's building official will issue a temporary final upon completion of the structural development of the property. When the city has returned to a stage two drought restriction, landscaping installation can be completed, and a building final will become available upon inspection by the city.	Yes

4	Stage 4	Other water feature or swimming pool restriction	1%	14.09.100(K); Existing pools shall not be emptied and refilled using city water unless required for health or safety reasons until the city has returned to a stage two drought restriction. Pools may be re-filled only to the extent necessary to replace evaporative losses.	Yes
4	Stage 4	Other - Prohibit vehicle washing except at facilities using recycled or recirculating water	1%	14.09.100(J); Automobiles or equipment shall be washed only at commercial establishments that recycle their water or by equipment and means that separates debris and recycles wash water for continual use.	Yes
4	Stage 4	Other	1%	14.09.100(I); Except where recycled water is used, golf courses shall reduce irrigation up to 40 percent.	Yes
4	Stage 4	Other	0%	14.09.100(L); No commitments shall be made to provide water service as part of any new land use entitlement (general plan, specific plan or amendments requesting new water allocations) until the city has returned to a stage two drought restriction. Currently approved specific plans with accompanying development agreements and projects or properties that have received water allocations in advance of full entitlements may be issued building permits so long as they comply with the remainder of this chapter.	Yes
4	Stage 4	Other	27-35%	14.09.100(B); Residential users and non-residential landscapes are to reduce water usage up to 40 percent.	Yes
5 & 6	Stage 5	Landscape - Other landscape restriction or prohibition	5%	14.09.110(C); Except where recycled water is used, water users shall reduce landscape irrigation as follows: 1. Turf shall not be irrigated. 2. Trees and shrubs may be irrigated with a properly functioning low volume landscape irrigation system or by use of a handheld hose equipped with a nozzle capable of completely shutting off the flow of water except when positive action or pressure to maintain the flow of water is applied. Low volume irrigation means the application of irrigation water at low pressure through a system of tubing or lateral lines and low-volume emitters such as drip or drip lines irrigating at less than two gallons per hour. These systems are specifically designed to apply small volumes of water slowly at or near the root zone of plants.	Yes
5 & 6	Stage 5	Other water feature or swimming pool restriction	1%	14.09.110(D); Filling new or existing swimming pools and spas with city water is prohibited.	Yes
5 & 6	Stage 5	Other	33%	14.09.110(B); Residential users are to reduce water usage up to 50 percent.	Yes
NOTES: For each successive drought level all preceding restrictions shall continue in place, except to the extent they are replaced by more restrictive conditions.					

1.5 Supply Augmentation and Operational Changes

Under normal operational conditions the City's groundwater strategy is to not pump well water in excess of the potable water that is injected annually. At this time, the City's injection volume of groundwater is planned to exceed extraction volume over time, as the groundwater program is still in development. The positive difference between the injection and extraction volume is the net volume of water that the City places into long-term storage or makes available for other users. Per Section 14.09.050 of the Municipal Code, when determining drought staging, the City cannot consider the effect of well water reducing the need for conservation until a stage three drought level is reached. Specifically, the code mentions that well water cannot be considered as an alternative to declaration of a stage one or stage two drought level. The City may choose to operationalize groundwater infrastructure in any year type based on water supply conditions and/or operations and maintenance strategies for infrastructure, however this shall not be determined to reduce or alleviate the appropriate drought stage given hydrologic conditions and surface water allocations for that year. The percent reduction that could result from this supply augmentation action for the different stages is provided in WSCP Table 7. Note that there are no supply augmentation actions for drought stages 1 and 2.in accordance with the provisions of the Municipal code.

WSCP Table 7 Supply Augmentation During Stage 3 Droughts and Higher

Standard Shortage Level	Roseville Municipal Code Stage	Supply Augmentation Methods and Other Actions by Water Supplier	Percent Reduction	Additional Explanation
3	3	Stored Emergency Supply	0-10%	Groundwater Pumped
4	4	Stored Emergency Supply	0-20%	Groundwater Pumped
5 & 6	5	Stored Emergency Supply	0-30%	Groundwater Pumped

The water utility would need to adjust its operations to support a drought stage that would prompt increased reliance on well water. Tasks for operations may include more frequent maintenance of well pumps and chemical injection pumps, monitoring of ground water level, and filter backwashing.

1.6 Compliance and Enforcement

The Water Conservation and Drought Mitigation ordinance grants the City the authority to enforce compliance with the water use limitations outlined in WSCP Table 6. The sections of the Water Conservation and Drought Mitigation Ordinance, detailing compliance and enforcement authority and measures are provided below.

14.09.020 General provisions

C. Administration and Enforcement. The city manager, or designee, including, but not limited to, an enforcement officer as defined herein, shall administer, implement, and enforce the provisions of this chapter. For purposes of this chapter an "enforcement officer" means any city employee or agent of the city with the authority to enforce any provision of this chapter and the authority to make any decision on behalf of the city manager required or called for by this chapter.

D. Compliance. All provisions of this chapter are subject to the compliance procedures set forth in this chapter unless otherwise expressly stated herein.

14.09.140 Violations

It is Unlawful for any user and/or person to violate any provision or fail to comply with any of the requirements of this chapter. Causing, permitting, aiding, abetting or concealing a violation of any provision of this chapter shall constitute a violation of this chapter. A violation of the provisions of this chapter shall occur irrespective of the negligence or intent of the violator and a violation of or failure to comply with any of the requirements of this chapter may be charged as either an infraction or a misdemeanor in the discretion of the city attorney. (Ord. 5311 § 2, 2014; Ord. 4629 § 1, 2008; Ord. 3834 § 3, 2002; Ord. 2413 § 2, 1991.)

14.09.150 Enforcement authority

A. Whenever the city manager, or designee (including, but not limited to, an enforcement officer), determines that a user and/or person has violated any provision of, or failed to meet a requirement of, this chapter, an administrative citation pursuant to Chapter 2.50 or a written compliance order pursuant to Chapter 2.52 may be issued to any user and/or person responsible for the violation.

B. Any compliance order issued may require without limitation any or all of the following:

1. The allocation of a particular amount of water to a given user and/or person responsible for the violation;
2. The issuance of a fine;
3. The installation of a flow restriction device;
4. The performance of monitoring, analyses, and reporting;
5. That violations shall cease and desist; and/or
6. The discontinuance of water service

The compliance order shall set forth a deadline within which the requirements of the compliance order must be completed. Said compliance order shall further advise that, should the violator fail to comply with the compliance order within the established deadline, a hearing on the compliance order shall be set. (Ord. 5491 § 11, 2015; Ord. 5311 § 2, 2014; Ord. 4629 § 1, 2008; Ord. 3034 § 3, 2002; Ord. 2817 § 1, 1994; Ord. 2413 § 2, 1991.)

14.090.180 Separate offense for each day.

Any user and/or person that violates any provision of this chapter shall be guilty of a separate offense for each and every day during any portion of which any user and/or person commits, continues, permits, or causes a violation thereof, and shall be punished accordingly. (Ord. 5311 § 2, 2014; Ord. 4629 § 1, 2008; Ord. 2413 § 2, 1991.)

1.7 Financial Consequences

During times of an emergency condition, the City is expected to see significant revenue reduction as a result of demand reduction actions lowering total gross water use. Additionally, enforcement of demand reduction actions, which could include investigating water waste complaints, follow ups to check for compliance, administering warnings or fines, and installation of flow restriction devices, would incur additional expenses that would not be present during non-emergency conditions.

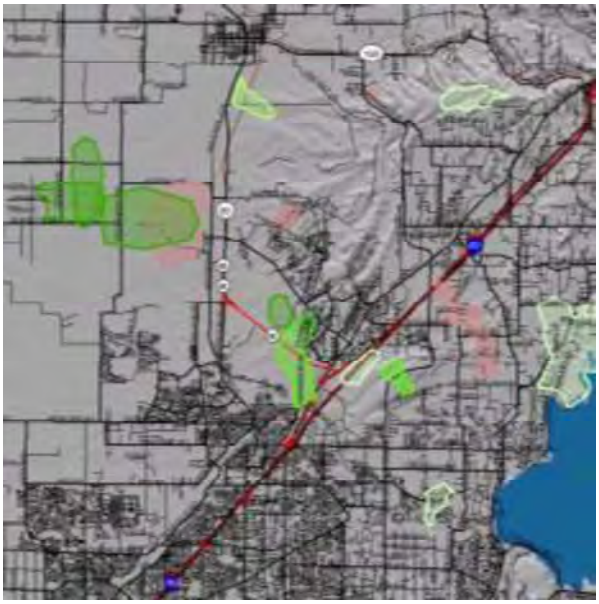
Revenue loss percentage for each drought stage is anticipated to be approximately equal to the demand reduction percentage for each respective shortage level. Enforcement expenses will vary based on customer compliance and drought stage. For instance, at the onset of demand reduction action implementation, resources needed for enforcement may be high as customers adjust to altering their use or compliance from customers could vary seasonally with customers finding it more difficult to comply during warmer months.

The City plans to mitigate the financial consequences associated with water shortage response actions primarily through their recently adopted water rate structure, which allows for adequate reserves to accommodate reductions in revenue and increases in cost due to drought. If the water shortage rate charges are insufficient to make up for the loss in revenue, the City will use financial reserves to mitigate remaining financial consequences.

1.8 Plan Adoption, Submittal, and Availability

The Water Shortage Contingency Plan will be included as an appendix in the 2020 Urban Water Management Plan (UWMP) and will be introduced and discussed with the public and City Council in the same meetings but as separate agenda items. The WSCP is intended to be a stand-alone document and as such will be adopted by the City independently of the UWMP. The WSCP may be updated as needed between the regular 5-year updates of the UWMP and no required WSCP update shall necessitate an update of the UWMP.

The City has encouraged community and public interest involvement in the WSCP using public meetings and web-based communication. A public meeting will be held on June 16, 2021 and will provide an opportunity for the general public to ask questions and raise concerns regarding the WSCP. Prior to the public hearing the draft WSCP was made available for public inspection on the City's website: www.roseville.ca.us/WSCP/.



The WSCP will be presented to City Council on June 16, 2021 for adoption. Copies of the adoption resolutions will be provided as Exhibit C. A copy of this WSCP will be submitted to DWR within 30 days of adoption and by July 1, 2021. The adopted WSCP will be submitted electronically to DWR. A CD or hardcopy of the adopted WSCP will also be submitted to the California State Library. No later than 30 days after submittal to DWR, copies of the adopted WSCP will be available for public review at the City's public offices. An electronic copy of this plan will also be available for review and download on the City's website: www.roseville.ca.us/WSCP/.

Stakeholders

Erik Angle, Sutter Roseville Medical Center
Michael Algots, Union Pacific Railroad
Rick Stalker, Placer County Association of Realtors

Special Acknowledgments

The development of this Plan would not have been possible without the dedication and commitment to this process by the Roseville Hazard Mitigation Plan Steering Committee. The dedication of this volunteer committee to allocate their time to this process is greatly appreciated. Also, the citizens of Roseville are commended for their participation in the outreach strategy identified by the Steering Committee. This outreach success will set the course to the successful implementation of this Plan during its next performance period.

EXECUTIVE SUMMARY

The Disaster Mitigation Act (DMA; Public Law 106-390) is the latest federal legislation enacted to encourage and promote proactive, pre-disaster planning as a condition of receiving financial assistance under the Robert T. Stafford Act. The DMA emphasizes planning for disasters before they occur. Under the DMA, a pre-disaster hazard mitigation program and new requirements for the national post-disaster hazard mitigation grant program were established.

The DMA encourages state and local authorities to work together on pre-disaster planning and it promotes sustainability as a strategy for disaster resistance. The intent is three-fold:

- To gather hazard, vulnerability, and mitigation information at the local level for use in state-level planning
- To ensure that state and local hazard mitigation planning is coordinated to the greatest extent practical
- To ensure that local jurisdictions are made aware of the hazards and vulnerabilities within their jurisdiction and to develop strategies to reduce those vulnerabilities.

This process ensures that mitigation actions are based on sound planning processes that account for the risks and capabilities of California communities. "Sustainable hazard mitigation" includes the sound management of natural resources, local economic and social resiliency, and the recognition that hazards and mitigation must be understood in the largest possible social and economic context. The enhanced planning network called for by the DMA helps local governments articulate accurate needs for mitigation, resulting in faster allocation of funding and more cost-effective risk reduction projects.

Using this initiative as a foundation for proactive planning, the City of Roseville has developed and maintained a hazard mitigation plan in an effort to reduce future loss of life and property resulting from disasters. It is impossible to predict exactly when and where disasters will occur or the extent to which they will impact the City. However, with careful planning and collaboration among public agencies, stakeholders, and citizens, it is possible to minimize losses that can occur from disasters.

Hazard mitigation is a way to reduce or alleviate the loss of life, personal injury, and property damage that can result from a disaster through long- and short-term strategies. It involves strategies such as planning, policy changes, programs, projects, and other activities that can mitigate the impacts of hazards on the City of Roseville. The responsibility for hazard mitigation lies with many, including private property owners; business and industry; and local, state, and federal government.

PLAN UPDATE

Federal regulations stipulate that hazard mitigation plans must describe the method and schedule for monitoring, evaluating, and updating the Plan. Prescribing an update schedule establishes an opportunity to reevaluate recommendations, monitor the impacts of actions that have been accomplished, and determine if there is a need to change the focus of mitigation strategies. DMA compliance is contingent on meeting the plan update requirement. A jurisdiction covered by a plan that has expired is not able to pursue elements of federal funding afforded under the Robert T. Stafford Act for which a current hazard mitigation plan is a prerequisite. The California Office of

Emergency Services (Cal OES) reviews all local hazard mitigation plans in accordance with DMA 2000 regulations and coordinates with local jurisdictions to ensure compliance with state requirements and the Code of Federal Regulations (Title 44 Section 201.6). Once Cal OES planning staff find the local hazard mitigation plan to be approvable, the Plan is forwarded to mitigation planning staff at Region IX of the Federal Emergency Management Agency (FEMA). FEMA performs final review and designates compliant plans as "approved pending adoption."

The City of Roseville used the plan update process to comprehensively revise its initial hazard mitigation plan, which was adopted in 2005. Due to the success of the initial plan, no major changes were made to the plan's approach and function. The subsequent 2011 Plan was enhanced using recent best available data and technology, especially in the risk assessment. For this 2016 planning effort, the enhanced format of the 2011 Plan has been retained in order to ensure the consistency of discussion points on each hazard of concern and address required elements for plan updates. The Plan update followed the same basic planning process as was followed under the initial effort and subsequent update. A Steering Committee was once again the critical component in the process. The Steering Committee consisted of 14 members of the community representing the public, private industry, and government. The Steering Committee met six times between November 2015 and August 2016 to provide recommendations and support throughout the planning process.

PLAN UPDATE METHODOLOGY

Development of the hazard mitigation plan included five phases:

- Phase 1—Organize resources
- Phase 2—Update the risk assessment
- Phase 3—Engage the public
- Phase 4—Assemble the updated Plan
- Phase 5—Plan adoption

Phase 1—Organize Resources

The City hired Tetra Tech, Inc. as a consultant to assist with development and implementation of the 2016 Plan. The Tetra Tech project manager assumed the role of the lead project planner and reported directly to a City project manager. Once the technical assistance was secured, a planning team was formed to lead the planning effort. The Steering Committee that oversaw the development of the initial plan remained intact during the initial performance period of the Plan and then provided oversight for the 2016 Plan. For the update process, some new members were added and some previous members left the committee. The planning team facilitated each Steering Committee meeting, which addressed a set of objectives based on the work plan established for the update. The Steering Committee met six times from November 2015 through August 2016. Coordination with other local, state and federal agencies involved in hazard mitigation in the region helped to ensure consistency with other ongoing efforts.

One of the Steering Committee's first action items was to review the State of California Hazard Mitigation Plan, the Roseville 2011 Hazard Mitigation Plan and all of the progress reports completed since the 2011 Plan. The Steering Committee identified hazards listed in the state plan to which Roseville is susceptible, in order to determine if there was a need to expand the scope of the risk assessment. Each annual progress report for the initial plan contains a section that recommends changes or enhancements to the Plan or plan development process. These reports effectively completed a key step of the plan update process before the update process began—identifying needs for changes or enhancements.

Phase 2 —Update the Risk Assessment

Federal planning guidance specifies comprehensive updates to the risk assessment portion of local hazard mitigation plans if there have been new technical data pertaining to a hazard developed by a creditable source since the Plan's previous development. Updated risk assessment efforts for the 2016 Plan included the following:

- The latest version of the Federal Emergency Management Agency's Hazus-MH risk assessment software was used to enhance the risk assessments for flood, dam failure and earthquake.
- All hazards of concern were updated with new relevant data.
- The Hazus default general building stock was updated using current address point, building footprint, parcel and tax assessor data.

Phase 3—Engage the Public

The Steering Committee drafted a comprehensive public involvement strategy for this update using multiple media sources. This strategy was built upon the Steering Committee's previous public engagement strategy and enhanced with social media and non-traditional outreach initiatives not regularly employed during the previous planning processes. The planning team identified stakeholders to target through the multi-disciplinary public involvement strategy.

Phase 4—Assemble the Updated Plan

The base format of the 2011 Plan was maintained in the 2016 Plan. However, enhancements were made to include the following components:

- The update describes the process used to review and analyze each section of the Plan.
- The update provides a discussion on how the public was kept apprised of the Plan's actions during the initial performance period.
- The update describes the need for changes to the risk assessment and what changes were made from the previous update.
- The update describes changes to risk exposure due to either of the following:
  - Successful mitigation projects
  - Changes in land use due to annexation or new development.
- The update describes changes to the action plan and the reasons for them.
- The update identifies completed, deleted, or deferred actions or activities from the previously approved plan as a benchmark for progress in the form of the 2015 Progress Report located in Appendix B. It also includes in its evaluation and prioritization new mitigation actions identified since the previous plan

Phase 5—Plan Adoption/Implementation

This Plan details a formal process for implementing and maintaining the Plan so that it remains an active and relevant document. The plan maintenance process includes a schedule for monitoring and evaluating the Plan's progress annually and producing a plan revision every five years. This process seeks to keep a steering body that meets the criteria of the original steering committee intact to perform this annual review. This phase includes strategies for continued public involvement and incorporation of the recommendations of this Plan into other planning mechanisms of the City, such as the comprehensive plan, capital improvement plan, building code, and development design guidelines.

MITIGATION GUIDING PRINCIPLE, GOALS, AND OBJECTIVES

Guiding Principle

The following guiding principle was identified for this hazard mitigation plan:

> Through community partnerships, establish a plan to reduce vulnerability to hazards in order to protect the health, safety, welfare, and economy of the City.

Goals

The Steering Committee established the following goals for the Plan update:

- G-1: Protect lives and reduce injury.
- G-2: Promote hazard mitigation as an integrated policy.
- G-3: Protect the continuity of local government to ensure no significant disruption of services during or due to a disaster.
- G-4: Improve community emergency management preparedness, collaboration and outreach.
- G-5: Minimize or reduce damage to property, including critical facilities.
- G-6: Develop and implement mitigation strategies that optimize public funds in an efficient and cost-effective way.
- G-7: Monitor and support the natural environment's capacity to deal with the impacts of natural hazards, taking into account the potential impacts of global climate change.

Objectives

Plan objectives were developed via a facilitated exercise that focused on finding objectives that meet multiple goals. During this exercise, Steering Committee members were requested to review the 2011 objectives in addition to newly proposed objectives. The selected objectives are listed in Table ES-1.

Table ES-1. Objectives for 2016 Multi-Hazard Mitigation Plan

Objective Number	Objective Statement	Goals for which it can be applied
O-1	Consider the impacts of hazards on future land uses in the City of Roseville by coordinating with other planning mechanisms such as the General Plan and land-use code development.	1, 2, 5, 7
O-2	Protect and sustain reliable local emergency operations and communication facilities during and after disasters.	1, 3, 4
O-3	Develop new or enhance existing early warning response systems and plans.	1, 3, 4, 5
O-4	Seek to enhance emergency response capabilities through improvements to infrastructure and City programs.	1, 4, 5
O-5	Enhance the understanding of all present and future hazards that impact the City of Roseville and the risk they pose.	1, 3, 4, 5, 7
O-6	Seek mitigation projects that provide the highest degree of hazard protection at the least cost.	1, 5, 6
O-7	Seek to update information on natural, environmental, and human-caused hazards, vulnerabilities, and mitigation measures by coordinating planning efforts and creating partnerships with appropriate local, private, county, state, and federal agencies.	1, 2, 3, 4, 5, 7
O-8	Seek to implement codes, standards, and policies that will protect life and property, including natural habitat, from the impacts of hazards within the City of Roseville.	1, 2, 3, 5, 6
O-9	Educate the public on preparedness for and mitigation of potential impacts of hazards on the City of Roseville.	1, 2, 4
O-10	Support efforts to retrofit, purchase, or relocate structures in high hazard areas, including those known to be repetitively damaged.	3, 5, 6

MITIGATION ACTION PLAN

The hazard mitigation action plan is a key element of this Plan. It is through the implementation of this action plan that the City of Roseville can strive to become disaster-resilient through sustainable hazard mitigation. This action plan includes an assessment of the capabilities of the City to implement hazard mitigation actions, a review of alternatives, a prioritization schedule, and a mitigation strategy matrix that identifies the following:

- Description of recommended actions
- Hazards addressed
- Objectives addressed
- Lead implementation agency (or agencies)
- Estimated benefits
- Estimated costs
- Timeframe for implementation
- Funding sources

For the purposes of this document, mitigation actions are defined as activities designed to reduce or eliminate losses resulting from the impacts of natural hazards of concern. Table ES-2 summarizes the hazard mitigation actions identified by this Plan update.

IMPLEMENTATION

Full implementation of the recommendations of this Plan will require time and resources. This Plan reflects an adaptive management approach in that specific recommendations and plan review protocols are provided to evaluate changes in vulnerability and action plan prioritization after the Plan is adopted. Funding resources are always evolving, as are requirements under state or federal mandates, and the true measure of the Plan's success will be its ability to adapt to the ever-changing climate of hazard mitigation.

Roseville has a long-standing tradition of progressive, proactive response to issues that may impact its citizens. This tradition is reflected in the development of this Plan. The Roseville City Council will assume responsibility for adopting the recommendations of this Plan and committing City resources toward its implementation. The City's track record in the mitigation of hazards impacting its citizens is exemplary. The framework established by this Plan will help maintain this tradition in that it identifies a strategy to maximize the potential for implementation based on available and potential resources. It commits the City to pursue actions when the benefits of a project exceed its costs. Most important, the City developed this Plan with extensive public input, which sets the stage for acceptance of the actions recommended for implementation in this Plan.

Table ES-2. Hazard Mitigation Action Plan Matrix

Action Number and Description	Timeframe
DAM FAILURE	
DF-1—Create a dam failure element for the City's emergency response plan that includes a phased warning protocol in response to the findings of the Folsom Dam Containment Dike Risk Assessment.	Short-term
DROUGHT	
D-1—Perform a groundwater recharge feasibility study to determine the most cost-effective way to replenish groundwater resources within Roseville.	Ongoing
D-2—Implement aquifer storage and recovery program that uses direct injection technique in areas identified as appropriate.	Ongoing
D-3—Continue to implement the Environmental Utility Department's recycled water program and seek all opportunities to expand its coverage, focusing first on the Sunset Industrial area. The City pumps recycled water through a system of purple pipes completely separate from potable (drinking water) pipes. The City pumps the recycled water to customers such as streetscapes, golf courses and parks, where it irrigates turf and shrubs. Using recycled water for uses such as landscape irrigation reduces demand on the potable water system, creating a more reliable water supply for the entire City. Recycled water is not subject to the effects of drought.	Ongoing
D-4—Promote active water conservation techniques and strategies to private property owners through Roseville-sponsored outreach projects such as printed media and the City's website.	Ongoing
EARTHQUAKE	
EQ-1—Perform building-specific, structural seismic vulnerability assessment of City-owned critical facilities constructed prior to 1980 (including infrastructure). Included in this assessment will be recommended mitigation alternatives that meet goals and objectives of this Plan.	Short-term; Ongoing
EQ-2—Incorporate earthquake mitigation measures for private property into existing City-sponsored outreach programs such as printed media and the City's website.	Short-term
EQ-3—Reassess the overall vulnerability to the earthquake hazard using the best available science and technology as it becomes available. State-sponsored programs, Seismic Hazards Mapping Act, and future FEMA-sponsored initiatives are anticipated to create a wealth of knowledge regarding this hazard that did not exist during the preparation of this Plan update	Short-term; Ongoing
FLOOD	
F-1—The City shall designate all areas identified as the 100-year floodplain. The boundaries of the 100-year floodplain shall be as specified in the floodplain designations section of this component of the City's general plan. Floodplain areas shall be preserved as specified in the open space and conservation element. Such preservation may include required dedication to the City. If needed, modify the City's ordinances to include floodplain use regulations consistent with the goals, policies, and implementation measures of the safety, land use, open space and conservation, and parks and recreation elements of the City's general plan.	Ongoing
F-2—Refer any development proposal that has a direct or indirect impact on flood protection to Public Works for comment. In addition, forward such proposals to other agencies as applicable, including the U.S. Army Corps of Engineers, California Reclamation Board, FEMA, California Department of Fish and Wildlife, Placer County Resource Conservation District, and Placer County Flood Control District. Consider the comments of the agencies during the development review process.	Ongoing
F 3—Continue City participation in the National Flood Insurance Program and the Community Rating System (CRS). Maintain the City's current CRS status as the nation's only Class 1 CRS community.	Ongoing
F 4—Maintain Roseville's compliance and good standing under the National Flood Insurance program	Ongoing
F 5—Continue the City's outreach program to flood-prone property owners and the citizens of Roseville to program is to help make them aware of the flood threat and how best to deal with them.	Ongoing
F 6—Continue to pursue a regional approach to flood issues by remaining actively involved in the Placer Co Flood Control District. This involvement includes cooperation in the development of a comprehensive regional database. Continue to participate in regional flooding studies, including the Auburn Creek/Coon Creek/Pleasant Grove Creek flood mitigation plan and the Dry Creek watershed flood control plan.	Ongoing

Action Number and Description	Timeframe
F 7—Continue City coordination with other agencies on issues of flood control. Coordination between the City and adjacent jurisdictions occurs through several mechanisms, including distribution of development proposals for review and comment. Continue City cooperation with federal, state, and local agencies, including the U.S. Army Corps of Engineers, California Reclamation Board, FEMA, California Department of Fish and Wildlife, Placer County Resource Conservation District, and Placer County Flood Control District.	Ongoing
F 8—Continue to develop, implement, and expand the Flood Alert and Early Warning Program systems and integrate the systems with other local jurisdictions to form a regional warning program.	Ongoing
F 9—Ensure that future specific plans and specific plan amendments are consistent with the goals and policies of the general plan. The specific plans shall include the designation and preservation of floodplain areas and adjacent habitat. Provisions shall be incorporated to ensure that public infrastructure, utilities, and emergency services remain functional during flood conditions. Such infrastructure and facilities include water, sewer and gas mains, telephone and electric lines, streets and bridges, hospitals, and fire and police stations. Financing mechanisms shall be explored to fund necessary flood protection improvements and maintenance. Development agreements may be used to secure implementation and funding provisions. (Specific plans have 100% cost recovery by developers).	Short -term
F 10—Monitor and regularly update City flood studies, modeling, and associated land use, zoning, and other development regulations at a minimum of every 5 years or whenever information becomes available that would significantly modify previous data. New information could include new studies, change in City policy, consideration of a major development project or specific plan, or implementation of a flood control project.	Short-term; Ongoing
F 11-Require a master drainage plan as part of the approval process for all specific plans and large development projects as determined by the Public Works director. The master drainage plan should consider cumulative regional drainage and flooding mitigation. The plan's intent is to ensure that the overall rate of runoff from a project does not exceed predevelopment levels. If necessary, this objective shall be achieved by incorporating run-off control measures to minimize peak flows and/or assistance in financing or otherwise implementing comprehensive drainage plans.	Short-term
F-12—Continue the Department of Parks, Recreation and Libraries' regular creek maintenance program within the City's creeks and floodplain areas. This program clears and removes debris that could contribute to blockage and flooding and may include the removal of silt. This is only done in areas of high risk to flood damage or where property or facilities are threatened by flooding.	Ongoing
F 13—Continue annual inspection and maintenance program of City storm drain systems. Review after every major storm system function and performance. This program removes debris that could contribute to blockage of the storm drain system.	Ongoing
F 14—Complete the final two phases of the Cirby/Linda/Dry Creek flood control project (Phase 1 and 2). Five of the seven phases of this project have been completed at a cost of about $18,000,000. The basis for determining viability of this project will be a benefit /cost analysis to determine if project meets federal grant eligibility requirements.	Long-term
F 15—Analyze alternative improvements to the Cirby/Linda/Dry Creek flood control project that may be cost effective in the flood-prone areas of Roseville: • Dry Creek from Darling Way to Riverside Avenue • Area on Dry Creek upstream of Folsom Road in the Columbia Avenue/Marilyn Avenue/Bonita Street area • Linda Creek near Samoa Way/Hurst Way area • Cirby Creek in the Trimble Way/Zien Court area	Long –term; depends on funding
F 16—Replace the Huntington Drive/Cirby Creek culvert with a bridge to protect Queens Court/Huntington Drive area. This project is overseen by Public Works department.	Long-term; depends on funding
F 17—Divert the main drainage storm drain system down Crestmont Avenue to Cirby Way and then into Dry Creek so that the existing system will not exceed capacity. If system capacity is exceeded, the intersection on Cirby Way and Crestmont Avenue and nearby homes will flood during major flood events.	Short-term
F 18—Continue to promote and sponsor programs to buy out, relocate, and flood-proof existing flood-prone structures within Roseville.	Long-term; depends on funding
F-19—Implement recommendation of Downtown Roseville Specific Plan to relocate the Public safety Building.	Long-term
F-20—Retrofit the City's Downtown library by sealing the exterior and installing a flood door to protect against flood damage should Dry Creek overspill the existing floodwall.	Short-term; Ongoing

Action Number and Description	Timeframe
F-21—Continue the Tree Mitigation Fund program administered by the Open Space Division in conjunction with non-profit organizations. The planting of oak trees in the open spaces adjacent to riparian zones increases infiltration and slows storm water surges.	Ongoing
F-22—Manage beaver dam sites for flood control protection and habitat restoration after dam removal. One primary issue is impacts to floodwater capacity of creeks. Part of the desired comprehensive approach to beaver management includes establishment of quantitative and qualitative "carrying capacity," including acre-feet of flood capacity lost. Implement a standard monitoring and reporting process to track beaver dam locations, population, and impacts. Gain regulatory approval for beaver management techniques such as biological control and habitat manipulation using the most benign options first.	Ongoing
F-23 – Develop the City's multi-use, multi-benefit stormwater retention project within the Pleasant Grove Creek Watershed, the Reason Farms Stormwater Retention Project.	Long-term
LANDSLIDE	
LS-1—Once California Geological Survey completes soils mapping for the Roseville vicinity under the Seismic Hazards Mapping Act, reassess landslide hazard using best available data to gauge the true vulnerability to this hazard.	Long-term
LS-2—Continue to implement policies adopted by the general plan that promote open space land uses within identified steep slope areas of Roseville. The City of Roseville Northeast Roseville Specific Plan and Stoneridge Specific Plans include the identified steep slope areas within Roseville. Both Plan Areas have continuing development. When individual projects are submitted,	Ongoing
SEVERE WEATHER	
SW-1—Continue the Shade Tree Program, an energy conservation rebate program provided by Roseville Electric	Ongoing
SW-2—Continue ongoing line clearing and weed abatement of electrical utilities to reduce exposure to severe weather hazards.	Ongoing
SW-3—Continue education/outreach programs to improve winter preparedness and minimize loss of life or injury.	Short-term, ongoing
SW-4—Enhance and implement strategies for debris management and removal during severe weather events.	Ongoing
SW 5-Continue to operate the Roseville Energy Park to support the City's electrical requirements and maintain service continuity during severe weather events.	Ongoing
SW 6-Take over ownership and operation of the Roseville Combustion Turbines from Northern CA Power Agency to support the City's electrical requirements and maintain service continuity during severe weather events.	Ongoing
WILDFIRE	
WF-1—Continue "Goat Grazing" program for removal of grassland in areas of Roseville potentially vulnerable to wildfire. Implement goat grazing in City open space and preserve areas for fire and invasive plant species management and native plant restoration.	Ongoing
WF-2—Enhance existing City public outreach programs to include information on fire safety, defensible spaces, and areas of concern.	Short-term; Ongoing
MULTIPLE HAZARDS	
MH-1—Continue to maintain Cal OES certification of all City inspectors for post-disaster damage assessment.	Ongoing
MH-2—Continue to maintain the hazard mitigation page on City website that provides following types of information: • The Hazard Management Plan and its progress reports • Hazard-specific information • Mitigation information by hazard, with specific emphasis on private property • Emergency response and warning information • Links to county, state, and federal related agencies	Ongoing

Action Number and Description	Timeframe
MH-3—Establish/maintain a post-disaster action plan to be part of the City Emergency operations plan that will include following elements: • Procedures for public information • Post-disaster damage assessment • Grant writing • Code enforcement • Redundant operations	Ongoing
MH-4—Implement an "Adopt an Open Space" program in coordination with the open space management program. Develop "adoption contracts" with neighborhoods, organizations, businesses, etc., describing the level of stewardship and the terms of the "adoption." Publicize these activities through online resource directory and other media to encourage participation.	Long--term
MH-5—Develop and disseminate best practices information to private property owners whose land is adjacent to open space areas describing stewardship opportunities and owners' role in preserving beneficial uses of open space areas (including vernal pool grassland and creek or riparian uses). Offer classes to provide in-depth information, such as demonstration projects, techniques for ecologically friendly weed abatement and vegetation control, and creating a backyard habitat compatible with open space areas.	Short-term; Ongoing
MH-6—Work with the Roseville City School District, local high school districts, and non-profit organizations to promote ecology-oriented curricula and stewardship activities. Identify resource and administrative barriers that may be limiting schools' abilities to more actively participate in stewardship, and work collaboratively to identify solutions.	Short-term; Ongoing
MH 7—Strive to maintain high availability of essential communication services	Ongoing
MH 8-Secure the City's physical locations that contain technology infrastructure	Ongoing
HUMAN-CAUSED	
HC 1-Commit support to initiatives within the Sacramento-Roseville-Arden-Arcade Metropolitan Statistical Area; continue to seek funding from other federal sources to fund its initiatives	Short-term
HC-2—Enhance emergency response capability of City by contingency planning for specific events based on identified vulnerabilities.	Short-term, ongoing
HC-3— Seek to establish appropriate staffing levels of public safety personnel to address vulnerabilities identified through an incremental targeted study that provides immediate needs as well as anticipated needs in 1 year, 5 years, and 10 years.	Short Term; depends on funding
HC-4—Prepare a site-specific vulnerability assessment of City-owned critical facilities that use the best available science and technology with regards human-caused hazards.	Long-term
HC-5—Address vulnerabilities identified in vulnerability assessment of water facilities performed by Environmental Utilities Department in response to EPA initiative.	Long-term
HC 6-Maintain compliance with California Energy Commission license conditions for the operations of the Roseville Energy Park with respect to Hazardous Material Management	Ongoing
HC 7-Establish and maintain compliance with state and local laws and regulations for the operation of the Roseville Combustion Turbines upon transfer of ownership from Northern CA Power Agency to City.	Ongoing
HC-8-Maintain compliance with North American Electric Reliability Corporation mandatory reliability standards related to plant operation, sabotage reporting and critical infrastructure protection (cyber security.	Ongoing
HC 9—Protect the City's data, technology infrastructure and staff against Cyber terrorism such as but not limited to: • Identity Theft • Virus/Malware/Ransomware/Spyware/Spam/Phishing • Network and system attacks • Web site hacking	Short Term; depends on funding
HC-10: Improve evacuation transportation routes within the City of Roseville by removing traffic constrictions.	Long-term
HUMAN HEALTH	
HH-1—Continue to collaborate with the Placer County Health Department to ensure the health and welfare of the community	Ongoing

Action Number and Description	Timeframe
HH-2—Support the public education efforts of the Placer County Health Department and the Placer Mosquito Abatement District	Ongoing
HH-3—Collaborate with the Placer County Mosquito Abatement District to review resource protection policies that conflict with human health protection in the City of Roseville and work to resolve these policy issues	Short-term; Ongoing

Part 1. Planning Process and Community Profile

1. INTRODUCTION TO HAZARD MITIGATION PLANNING

1.1 WHY PREPARE THIS PLAN?

1.1.1 The Big Picture

Hazard mitigation is defined as any action taken to reduce or alleviate the loss of life, personal injury, and property damage that can result from a disaster. It involves long- and short-term actions implemented before, during and after disasters. Hazard mitigation activities include planning efforts, policy changes, programs, studies, improvement projects, and other steps to reduce the impacts of hazards.

For many years, federal disaster funding focused on relief and recovery after disasters occurred, with limited funding for hazard mitigation planning in advance. The Disaster Mitigation Act (DMA; Public Law 106-390), passed in 2000, shifted the federal emphasis toward planning for disasters before they occur. The DMA requires state and local governments to develop hazard mitigation plans as a condition for federal disaster grant assistance. Regulations developed to fulfill the DMA's requirements are included in Title 44 of the Code of Federal Regulations (44 CFR).

The responsibility for hazard mitigation lies with many, including private property owners, commercial interests, and local, state and federal governments. The DMA encourages cooperation among state and local authorities in pre-disaster planning. The enhanced planning network called for by the DMA helps local governments articulate accurate needs for mitigation, resulting in faster allocation of funding and more cost-effective risk-reduction projects.

The DMA also promotes sustainability in hazard mitigation. To be sustainable, hazard mitigation needs to incorporate sound management of natural resources and address hazards and mitigation in the largest possible social and economic context.

1.1.2 Roseville's Response to the DMA

Roseville has a long-standing reputation as a national leader in risk reduction through proactive mitigation. This reputation has been built through innovative planning and a commitment to protecting its citizens from the impacts of natural disasters. Embracing the goals of the DMA, Roseville created an initial hazard mitigation plan that became a model nationally and has been touted by the Federal Emergency Management Agency (FEMA) as a "mitigation success story." The *City of Roseville Hazard Mitigation Plan* was adopted by the Roseville City Council on July 20, 2005, and was formally approved by FEMA Region IX on August 10, 2005. The initial plan was developed with the following objectives:

- Meet or exceed program requirements specified under the DMA, thereby enabling the City of Roseville to continue using federal grant funding to reduce risk through mitigation.
- Meet not only state and federal requirements but also the needs of the City (this Plan addresses human-caused hazards, which are not required to be addressed under the DMA).
- Develop the Plan according to FEMA's Community Rating System (CRS) guidelines so that Roseville can meet requirements to become the nation's first CRS Class 1 community.

- Create a risk assessment that focuses on the City of Roseville hazards of concern.
- Coordinate existing plans and programs so that high-priority actions and projects to mitigate possible disaster impacts are funded and implemented.

The initial plan was developed according to the requirements of 44 CFR, qualifying the City to pursue funding under the Robert T. Stafford Act. The City has achieved numerous objectives identified in the Plan. Local hazard mitigation plans must be regularly updated to comply with the DMA. The City responded to this requirement with a plan update process that resulted in the 2011 Multi-Hazard Mitigation Plan, and now this 2016 Multi-Hazard Mitigation Plan.

This hazard mitigation plan update identifies resources, information, and strategies for reducing risk from natural hazards. Elements and strategies in the Plan were selected because they meet a program requirement and because they best meet the needs City residents. The Plan will help guide and coordinate mitigation activities throughout the planning area. It also will meet the planning requirements of the CRS, allowing the City of Roseville to maintain its CRS Class 1 rating.

1.2 WHO WILL BENEFIT FROM THIS PLAN?

All residents and businesses of the City of Roseville are the ultimate beneficiaries of this hazard mitigation plan update. The Plan reduces risk for those who live in, work in, and visit the City. It provides a viable planning framework for all foreseeable natural hazards. Participation in development of the Plan by key stakeholders helped ensure that outcomes will be mutually beneficial. The Plan's goals and recommendations can lay groundwork for the development and implementation of local mitigation activities and partnerships.

1.3 CONTENTS OF THIS PLAN

This hazard mitigation plan is organized into three primary parts:

- Part 1—Planning Process and Community Profile
- Part 2—Risk Assessment
- Part 3—Mitigation Strategy.

Each part includes elements required under federal guidelines. DMA compliance requirements are cited at the beginning of subsections as appropriate to illustrate compliance.

The following appendices provided at the end of the Plan include information or explanations to support the main content of the Plan:

- Appendix A—Public outreach information used in preparation of this update
- Appendix B—The 2015 Progress Report.

2. PLAN UPDATE—WHAT HAS CHANGED

2.1 THE PREVIOUS PLAN

Several factors initiated the first hazard mitigation planning effort for the City of Roseville:

- The Roseville area has significant exposure to numerous natural hazards that have caused millions of dollars in past damage.
- Limited local resources make it difficult to be pre-emptive in risk reduction actions. Being able to leverage federal financial assistance is paramount to successful hazard mitigation in the area.
- The City wanted to be proactive in its preparedness for natural hazards.

With these factors in mind, the City of Roseville committed to the preparation of its initial plan by attaining grant funding for the effort and then securing technical assistance to complete a planning process that complied with all requirements. Five years later, the City followed a similar process to update the Plan.

Due to the success of the 2005 effort, no major changes were made to the Plan's approach and function during the 2011 planning process. The 2011 update enhanced the 2005 effort but remained consistent on discussion points for each hazard of concern. The 2011 Plan format changed to address required elements for plan updates. A major addition to the 2011 Plan, per recommendations from FEMA Region IX, was the inclusion of dam failure as a hazard of concern.

The 2011 Plan update followed a phased approach to planning per FEMA's July 2008 *Local Hazard Mitigation Planning Guidance*.

2.2 MITIGATION SUCCESS STORIES

One of the principal objectives of the initial plan was to create a plan that would help the City achieve the highest possible rating under FEMA's Community Rating System (CRS) program. The CRS program has stringent requirements for Classes 4 or better, and especially for Class 1. Several of these requirements are related to planning, and the initial plan was developed to meet these requirements. The Insurance Services Office (ISO), which performs classification reviews for the CRS, determined that the initial plan met the Class 1 requirements. In December 2005, the City was verified with sufficient credit to become the nation's first and only CRS Class 1 community. This classification went into effect on October 1, 2006, and was confirmed again during the re-verification process in 2008, and most recently in 2014. As of the writing of this Plan, the City of Roseville maintains its status as the nation's only CRS Class 1 community.

Detailed accounts of other successful mitigation actions completed by the City during each reporting period are included in the progress reports on the previous hazard mitigation plan, including the 2015 Progress Report contained in Appendix B of this Plan.

2.3 WHY UPDATE?

2.3.1 Federal Eligibility

Under 44 CFR, hazard mitigation plans must present a schedule for monitoring, evaluating, and updating the Plan. This provides an opportunity to reevaluate recommendations, monitor the impacts of actions that have been accomplished, and determine if there is a need to change the focus of mitigation strategies. A jurisdiction covered by a plan that has expired is not able to pursue elements of federal funding under the Robert T. Stafford Act for which a current hazard mitigation plan is a prerequisite.

2.3.2 Changes in Development

Hazard mitigation plan updates must be revised to reflect changes in development within the planning area during the previous performance period of the Plan (44 CFR Section 201.6(d)(3)). The Plan must describe changes in development in hazard-prone areas that increased or decreased vulnerability since the last plan was approved. If no changes in development impacted the jurisdiction's overall vulnerability, then plan updates may validate the information in the previously approved plan. The intent of this requirement is to ensure that the mitigation strategy continues to address the risk and vulnerability of existing and potential development and takes into consideration possible future conditions that could impact vulnerability.

The Roseville planning area experienced a 31-percent increase in population between 2003 and 2013, an average annual growth rate of 3.1 percent per year (Placer County Office of Economic Development, 2014). The City has adopted a comprehensive plan that governs land-use decisions and policy-making, as well as a building code and specialty ordinances based on state and federal mandates. This Plan update assumes that some new development triggered by the increase in population occurred in hazard areas. Because all such new development would have been regulated pursuant to local programs and codes, it is assumed that vulnerability did not increase even if exposure did.

2.4 THE UPDATED PLAN—WHAT IS DIFFERENT?

The updated Plan differs from the initial plan in a variety of ways:

- **Climate Change Impacts—**The most recent version of the California hazard mitigation plan noted specific hazards that are created or augmented by the environmental impacts of climate change. Additionally, the recent passage of Senate Bill 379 brings the effects of climate change into focus as it relates to mitigation and general planning. As a result, instead of briefly reviewing the impact of climate change in each individual hazard profile, this 2016 Plan update dedicates a comprehensive chapter to the issue of climate change and its effects on the state-identified climate-related hazards.
- **Drought Chapter Enhancements—**Enhancements to the drought Chapter were made to reflect current, historic drought conditions of the stat, region, and city. This information was supplemented with new information provided by the City's 2015 Urban Water Management Plan (UWMP) update.
- **Public Engagement Enhancements through Social Media —**Social media platforms not available during the previous planning initiative were used to enhance public outreach capabilities.
- **Planning Area Changes—**The City adopted 3 new Specific Plans since the previous plan update. As such, all development and demographic information will include data pertaining to these new Specific Plan Areas of Sierra Vista, Creekview, and Amaruso Ranch.
- **Separation of Natural from Non-natural Hazards—**In an effort to draw distinction from the natural hazards from the non-natural hazards, the non-natural hazards (Human Caused and Human Health Hazards) are placed after the natural hazards instead of listed alphabetically with the natural hazards.

- **Human-Caused Hazards—**The human-caused hazards noted in the 2011 effort were updated for the 2016 Plan. These human-caused hazards were moved within the document to after the natural hazards due to the difference in assessing risk. Cyber threat was included as a new human-caused hazard, due to the increase in connectivity, technological advances, and emergence of "hacktivist" groups.
- **Human Health Hazards—**The human health hazards noted in the 2011 effort were updated for the 2016 Plan. These human health hazards were moved within the document to after the natural hazards due to the difference in assessing risk. Ebola was included as a new human health hazard due to the 2014 West Africa Ebola outbreak that threatened the United States, though that threat never fully materialized. Zika virus is included in the discussion, as well.
- **Additional Demographic Information—**Additional demographic data are included—beyond age and disability/access and function need—addressing Roseville's industry, business and institutional footprint. Employment trends and occupations are included to develop a fuller understanding of the population of Roseville.
- **Disabilities, Access and Functional Need Language Revision—**The entire Plan was updated to reflect appropriate references when discussing individuals with disabilities and others with access and functional needs. This includes person-first language and references to individuals instead of the more general term of populations.
- **Guiding Principle—**A guiding principle for the hazard mitigation plan was developed. The goals and objectives of the Plan support the guiding principle.

Table 2-1 indicates the major changes between the 2011 and 2016 plans as they relate to 44 CFR planning requirements.

Table 2-1. Plan Changes Crosswalk

44 CFR Requirement	Previous Plan (2011)	Updated Plan (2016)
§201.6(b): In order to develop a more comprehensive approach to reducing the effects of natural disasters, the planning process shall include: • **An opportunity for the public to comment on the Plan during the drafting stage and prior to Plan approval;** • **An opportunity for neighboring communities, local and regional agencies involved in hazard mitigation activities, and agencies that have the authority to regulate development, as well as businesses, academia and other private and non-profit interests to be involved in the planning process; and** • **Review and incorporation, if appropriate, of existing plans, studies, reports, and technical information.**	The plan development process deployed under this update was similar to the 2005 Plan. Chapters 1, 2, and 3 describe the planning process for the 2011 updated Plan.	The plan development process deployed under this update was similar to the 2011 Plan; however, additional public outreach initiatives were conducted through new social media platforms. Chapters 1, 2, and 3 describe the planning process for the 2016 updated Plan.

44 CFR Requirement	Previous Plan (2011)	Updated Plan (2016)
§201.6(c)(2): The Plan shall include a risk assessment that provides the factual basis for activities proposed in the strategy to reduce losses from identified hazards. Local risk assessments must provide sufficient information to enable the jurisdiction to identify and prioritize appropriate mitigation actions to reduce losses from identified hazards.	Chapters 6 through 15 presents a risk assessment of eight hazards of concern: Climate change, dam failure, drought, earthquake, flood, landslide, severe weather, and wildfire. These hazards are profiled as they impact Roseville. Additionally, human-caused and health hazards were qualitatively assessed to develop a more complete picture of the hazards facing the county.	The 2016 Plan presents a risk assessment of the same hazards as the 2011 Plan—in Chapters 6 through 16. Each hazard was updated with new occurrence information from 2011 through 2015 where applicable, and a new comprehensive risk assessment was conducted using updated building stock, demographics, and land use information.
§201.6(c)(2)(i): [The risk assessment shall include a] description of the … location and extent of all natural hazards that can affect the jurisdiction. The Plan shall include information on previous occurrences of hazard events and on the probability of future hazard events.	Chapters 6 through 15 presents a risk assessment of each hazard of concern. Each chapter includes the following components: • Hazard profile-including maps of extent and location, historical occurrences, frequency, severity and warning time. • Secondary hazards • Climate change impacts • Exposure of people, property, critical facilities and environment. • Vulnerability of people, property, critical facilities and environment. • Future trends in development • Scenarios • Issues	The 2016 Plan presents a risk assessment of the same hazards as the 2011 Plan—from Chapters 6 through 16. Each hazard was updated with new occurrence information from 2011 through 2015 where applicable, and a new comprehensive risk assessment was conducted using updated building stock, demographics, and land use information. Climate change impacts were omitted from the individual hazards of concern, as the new climate change chapter provides a more detailed and comprehensive overview of climate change impacts for identified hazards.
§201.6(c)(2)(ii): [The risk assessment shall include a] description of the jurisdiction's vulnerability to the hazards described in paragraph (c)(2)(i). This description shall include an overall summary of each hazard and its impact on the community	Vulnerability was assessed for all hazards of concern. The Hazus-MH computer model was used for the dam failure, earthquake and flood hazards. These were Level 2 user-defined analyses using City data. Site-specific data on City-identified critical facilities was entered into the Hazus model. Hazus outputs were generated for other hazards by applying an estimated damage function to an asset inventory was extracted from Hazus-MH.	Vulnerability was again assessed for all hazards of concern using the Hazus-MH computer model for dam failure, earthquake, and flood hazards. Level 2 analysis was again conducted for these hazards. Site-specific data on City-identified critical facilities was entered into the Hazus model. Hazus outputs were generated for other hazards by applying an estimated damage function to an asset inventory extracted from Hazus-MH. All assets were updated using current available data.
§201.6(c)(2)(ii): [The risk assessment] must also address National Flood Insurance Program insured structures that have been repetitively damaged floods	The Plan includes a comprehensive analysis of repetitive loss areas that includes an inventory of the number and types of structures in the repetitive loss area. Repetitive loss areas are delineated, causes of repetitive flooding are cited, and these areas are reflected on maps	The Plan includes a comprehensive analysis of repetitive loss areas that includes an inventory of the number and types of structures in the repetitive loss area. Repetitive loss areas are delineated, causes of repetitive flooding are cited, and these areas are reflected on maps.

44 CFR Requirement	Previous Plan (2011)	Updated Plan (2016)
§201.6(c)(2)(ii)(A): The plan should describe vulnerability in terms of the types and numbers of existing and future buildings, infrastructure, and critical facilities located in the identified hazard area.	A complete inventory of the numbers and types of buildings exposed was generated for each hazard of concern. The Steering Committee defined "critical facilities" for the planning area, and these were inventoried by exposure. Each hazard chapter provides a discussion on future development trends.	Building inventory was updated and the Steering Committee revised the critical facilities definition to reflect 2016 priorities. Each hazard chapter again provides a discussion on future development trends.
§201.6(c)(2)(ii)(B): [The plan should describe vulnerability in terms of an] estimate of the potential dollar losses to vulnerable structures identified in paragraph (c)(2)(i)(A) and a description of the methodology used to prepare the estimate.	Loss estimations in terms of dollar loss were generated for all hazards of concern. These were generated by Hazus-MH for the dam failure, earthquake and flood hazards. For the other hazards, loss estimates were generated by applying a regionally relevant damage function to the exposed inventory. In all cases, a damage function was applied to an asset inventory. The asset inventory was the same for all hazards and was generated in Hazus.	Loss estimates were recalculated using new data and the new asset inventory.
§201.6(c)(2)(ii)(C): [The plan should describe vulnerability in terms of] providing a general description of land uses and development trends within the community so that mitigation options can be considered in future land use decisions.	There is a discussion on future development trends as they pertain to each hazard of concern. This discussion looks predominantly at the existing land use and the current regulatory environment that dictates this land use.	The Plan contains a discussion on development trends from the previous planning period, through future trends anticipated in the next five years as they pertain to each hazard.
§201.6(c)(3): The plan shall include a mitigation strategy that provides the jurisdiction's blueprint for reducing the potential losses identified in the risk assessment, based on existing authorities, policies, programs and resources, and its ability to expand on and improve these existing tools.	The Plan contains a guiding principal, goals, objectives and actions. The actions strive to meet multiple objectives. The objectives are broad and overarching; each meets multiple goals and stands alone as a component of the Plan. The City of Roseville completed a capability assessment that looks at its regulatory, technical and financial capabilities.	The Steering Committee reviewed the 2011 guiding principle, goals, objectives, and actions and made minor adjustments to reflect 2016 priorities. The City of Roseville updated its capability assessment to reflect regulatory revisions and new initiatives.
§201.6(c)(3)(i): [The hazard mitigation strategy shall include a] description of mitigation goals to reduce or avoid long-term vulnerabilities to the identified hazards.	The Steering Committee identified a guiding principal, goals and objectives.	The Steering Committee reviewed the 2011 guiding principle, goals, objectives, and actions and made minor adjustments to reflect 2016 priorities.
§201.6(c)(3)(ii): [The mitigation strategy shall include a] section that identifies and analyzes a comprehensive range of specific mitigation actions and projects being considered to reduce the effects of each hazard, with particular emphasis on new and existing buildings and infrastructure.	Chapter 18 includes a hazard mitigation catalog that was developed through a facilitated process. This catalog identifies actions that manipulate the hazard, reduce exposure to the hazard, reduce vulnerability, or increase mitigation capability. The catalog further segregates actions by scale of implementation. A table in the action plan section analyzes each action by mitigation type to illustrate the range of actions selected.	The hazard mitigation catalog developed in 2011 was enhanced with results of the 2016 planning effort focusing on updated program capabilities and the dam failure and cyber threat hazards.
§201.6(c)(3)(ii): [The mitigation strategy] must also address the jurisdiction's participation in the National Flood Insurance Program, and continued compliance with the program's requirements, as appropriate.	The City of Roseville has identified an action stating its commitment to maintain compliance and good standing under the National Flood Insurance Program. Additionally, the City identified multiple actions to maintain its Class 1 standing under the CRS program.	The City of Roseville has identified an action stating its commitment to maintain compliance and good standing under the National Flood Insurance Program. Additionally, the City identified multiple actions to maintain its Class 1 standing under the CRS program.

44 CFR Requirement	Previous Plan (2011)	Updated Plan (2016)
§201.6(c)(3)(iii): [The mitigation strategy shall describe] how the actions identified in Section (c)(3)(ii) will be prioritized, implemented, and administered by the local jurisdiction. Prioritization shall include a special emphasis on the extent to which benefits are maximized according to a cost benefit review of the proposed projects and their associated costs.	Each recommended initiative is prioritized using a qualitative methodology that looked at the objectives the project will meet, the timeline for completion, how the project will be funded, the impact of the project, the benefits of the project and the costs of the project. This prioritization scheme is detailed in Chapter 19.	The updated Plan uses the same qualitative approach to prioritization as used for the 2011 Plan.
§201.6(c)(4)(i): [The plan maintenance process shall include a] section describing the method and schedule of monitoring, evaluating, and updating the mitigation plan within a five-year cycle.	Chapter 7 details a plan maintenance strategy	Chapter 19 retains the plan maintenance strategy developed in 2011.
§201.6(c)(4)(ii): [The plan shall include a] process by which local governments incorporate the requirements of the mitigation plan into other planning mechanisms such as comprehensive or capital improvement plans, when appropriate.	Chapter 7 details recommendations for incorporating the Plan into other planning mechanisms such as: • General plan • Emergency response plan • Capital improvement programs • Municipal code • Stormwater Master Plan This chapter additionally discusses current and future integration opportunities.	Recommendations are provided for incorporating the Plan into other planning mechanisms. This update additionally discusses current and future integration opportunities.
§201.6(c)(4)(iii): [The plan maintenance process shall include a] discussion on how the community will continue public participation in the plan maintenance process.	Chapter 7 details a comprehensive strategy for continuing public involvement.	A comprehensive strategy is provided for continuing public involvement with additional information regarding social media.
§201.6(c)(5): [The local hazard mitigation plan shall include] documentation that the plan has been formally adopted by the governing body of the jurisdiction requesting approval of the plan (e.g., City Council, County Commission, Tribal Council).	Chapter 6 contains the resolution for adoption of this Plan.	The implementation chapter for this update contains the resolution of adoption.

3. PLAN UPDATE APPROACH

Local governments are required to review and revise their hazard mitigation plans and resubmit them for approval within five years in order to remain eligible for mitigation project grant funding (44 CFR §201.6(d)(3)). FEMA's July 2008 *Local Hazard Mitigation Planning Guidance* outlines five phases for updates:

- Phase 1—Organize resources
- Phase 2—Update the risk assessment
- Phase 3—Engage the public
- Phase 4—Assemble the updated Plan
- Phase 5—Plan adoption/implementation.

Phases 1 through 4 are discussed in the following sections. The elements of Phase 5 are described in Chapter 19.

3.1 PLANNING RESOURCE ORGANIZATION

The first phase of planning was to organize needed resources. This phase had the following primary objectives:

- Secure grant funding
- Form a planning team
- Confirm political support for the process
- Establish a steering committee
- Coordinate with other agencies
- Review existing programs.

3.1.1 Internal Funding

The planning effort was made possible through local funds for the City of Roseville.

3.1.2 Formation of the Planning Team

The City hired Tetra Tech, Inc. as a consultant to assist with the 2016 Plan update. The Tetra Tech project manager acted as lead project planner, reporting directly to a City project manager. Once the technical assistance was secured, a planning team made up of the following members was formed to lead the planning effort:

- Rob Jensen (Roseville City Manager's Office)—City Manager, project oversight
- Carl Walker (City of Roseville Department of Public Works)—Floodplain management
- Jason Rizzi (City of Roseville Fire Department)—Emergency preparedness
- Wayne Wiley (City of Roseville Development Services Department)-City planning lead
- Rob Flaner (Tetra Tech)—Lead project planner
- Carol Baumann (Tetra Tech)—Hazus-MH/GIS lead
- Jessica Cerutti (Tetra Tech)—Hazard Identification and profiling
- Dan Portman (Tetra Tech)—Lead editor.

3.1.3 The Steering Committee

Hazard mitigation planning is one of the best ways to enhance collaboration and gain support among the parties whose interests might be affected by hazard losses. By working together, a broad range of stakeholders can identify and create partnerships that pool resources to achieve a common vision for the community. The Steering Committee that oversaw development of the initial plan remained intact during the performance period of that plan and subsequently provided oversight for the 2011 Plan. For this 2016 update process, some new members were added and some previous members left the committee. Table 3-1 lists the 2016 Steering Committee members.

Table 3-1. Steering Committee Members

Name	Title	Jurisdiction/Agency
Grace Keller[a]	Citizen	Community Emergency Response Team
Wayne Wiley[b]	Associate Planner	The City of Roseville Development Services
Rob Jensen	City Manager	The City of Roseville City Manager's Office
Jason Rizzi	Emergency Preparedness Manager	City of Roseville Fire Department
Carl Walker	Senior Civil Engineer	The City of Roseville Public Works
Helen Dyda	Public Information Specialist	City of Roseville Communications
Jaime Garrett	Fire Department Public Information Officer	City of Roseville Fire Department
Erik Angle	Emergency Preparedness Manager	Sutter Roseville Medical Center
Brenette Macintosh	Safety Officer	Consolidated Communications
Mark Lacher	Risk Manager	Consolidated Communications
Jim Williams	Citizen	Meadow Oaks Neighborhood Association
Joseph Van Zant	Citizen/Hazardous Materials Consultant	Roseville Coalition of Neighborhood Associations
Rod Rodriguez	Senior Emergency Services Specialist	Placer County Office of Emergency Services
Rick Stalker	Stalker & Burnett RE Group	Placer County Association of Realtors
Michael Algots	Manager, Hazardous Materials	Union Pacific Railroad

a. Steering Committee Chairperson
b. Steering Committee Vice Chairperson

Leadership roles and ground rules were reconfirmed during the Steering Committee's initial meeting for the plan update on November 3, 2015. The Steering Committee agreed to meet on the first Tuesday of every month as needed throughout the course of the 2016 Plan's development. The planning team facilitated each Steering Committee meeting, which addressed a set of objectives based on the work plan established for the update. The Steering Committee met six times from November 2015 through June 2016. Meeting agendas, minutes and attendance logs are available for review. All Steering Committee meetings were open to the public, and agendas and meeting minutes were posted to the internet.

3.1.4 Coordination with Other Agencies

Coordination with other local, state and federal agencies involved in hazard mitigation in the region helped to ensure consistency with other ongoing efforts. 44 CFR requires that opportunities for involvement in the planning process be provided to neighboring communities, local and regional agencies involved in hazard mitigation, agencies with authority to regulate development, businesses, academia, and other interests (Section 201.6.b.2). Agency coordination was accomplished as follows:

- **Steering Committee Involvement—**Agency representatives were invited to participate on the Steering Committee.

- **Coordination with Placer County—**Placer County had recently finished updating its multi-jurisdictional hazard mitigation plan and was invited to join the Steering Committee. County staff were able to provide insight into lessons learned through the County's update process. The County's involvement also allowed for integration between the two plan updates.
- **Agency Notification—**The following agencies were invited to participate in the process and were kept apprised of plan development milestones:

  - FEMA Region IX
  - California Governor's Office of Emergency Services (Cal OES)
  - California Department of Water Resources
  - Placer County Office of Emergency Services
  - Placer County Flood Control District
  - Placer County Office of Education
  - Sacramento County Department of Water Resources
  - City of Rocklin
  - City of Citrus Heights
  - Roseville City School District
  - Eureka School District
  - Dry Creek School District
  - Center School Districts
  - Roseville Joint Union High School District
  - U.S. Bureau of Reclamation

  All of these agencies received meeting announcements, meeting agendas, and meeting minutes by e-mail throughout the plan development process. This approach proved to be beneficial when these agencies supported the effort by attending meetings or providing feedback on issues. All of these agencies were also informed about the plan update web page for up-to-date information.

- **Pre-Adoption Review—**All the agencies listed above were provided means to review and comment on the mitigation action plan for the 2016 Plan. The predominant means for this review was through the project web page. Each agency was sent an e-mail informing them that draft portions of the update were available for review. In addition, the complete draft plan was sent for a pre-adoption review to FEMA Region IX, the ISO, and the Placer County Office of Emergency Services. No immediate comments were received from these agencies during the pre-adoption public review period.

3.1.5 Review of Existing Programs

Hazard mitigation planning must include review and incorporation, if appropriate, of existing plans, studies, reports and technical information (44 CFR Section 201.6.b(3)). Chapter 4 of this Plan provides a review of laws and ordinances in effect within the planning area that can affect hazard mitigation actions, as well as an assessment of the City's regulatory, technical and financial capabilities to implement hazard mitigation actions.

Of particular interest for the plan update effort are the City of Roseville General Plan, the City of Roseville Emergency Response Plan (an emergency support function-based plan that directs emergency response actions in the planning area), and the State of California 2013 Enhanced Hazard Mitigation Plan.

One of the Steering Committee's first action items was to review the State of California Enhanced Hazard Mitigation Plan and all of the progress reports completed during the performance period for the initial plan. The Steering Committee identified hazards listed in the state plan to which the Roseville area is susceptible, in order to determine if there was a need to expand the scope of the risk assessment. The committee also reviewed the goals, objectives and strategies of the state plan in order to select goals, objectives, and actions for the City's Plan that are consistent with those of the state.

Each annual progress report for the initial plan contains a section that recommends changes or enhancements to the Plan or plan development process. These reports effectively completed a key step of the plan update process before the update process began—identifying needs for changes or enhancements.

3.2 RISK ASSESSMENT UPDATE

Local hazard mitigation plans must provide sufficient hazard and risk information to identify and prioritize appropriate actions to reduce hazard-related losses. This includes detailed descriptions of all the hazards that could affect the jurisdiction, along with an analysis of the jurisdiction's vulnerability to those hazards. The update of the risk assessment is typically the most involved part of the plan update process.

FEMA planning guidance specifies comprehensive updates to the risk assessment portion of local hazard mitigation plans if there have been new technical data pertaining to a hazard developed by a creditable source since the plan's initial development or previously completed update. Updated risk assessment efforts for the 2016 Plan included the following:

- The latest version (2.2) of FEMA's Hazus-MH risk assessment software was used to enhance the risk assessments for the flood, dam and earthquake hazards.
- All hazards of concern were updated with new relevant data.
- The Hazus default general building stock was updated using current address point, building footprint, parcel and tax assessor data.

A detailed description of the methodology deployed in the update of the risk assessment is provided in Chapter 5.

3.3 PUBLIC INVOLVEMENT

Broad public participation in the planning process helps ensure that diverse points of view about the planning area's needs are considered and addressed. The public must have opportunities to comment on disaster mitigation plans during the drafting stages and prior to plan approval (44 CFR, Section 201.6(b)(1)). The Community Rating System expands on these requirements by making CRS credits available for optional public involvement activities.

3.3.1 Strategy

The Steering Committee drafted a comprehensive public involvement strategy for this update using multiple media sources. This strategy was built upon the Steering Committee's perception of what was effective during development of the update, in addition to the use of social media as a major message distribution vehicle. The planning team identified stakeholders to target through the multi-disciplinary public involvement strategy. The strategy for involving the public in the development of the Plan emphasized the following elements:

- Include members of the public on the Steering Committee.
- As was done for the previous update, use a survey to reassess the public's perception of risk and support of hazard mitigation and to get direction on alternatives.
- Hold public meetings to describe the plan update process and progress and to collect input from a wide range of the public.
- Develop a unified message for distribution on social media platforms.
- Attempt to reach as many citizens in the planning area as possible through the use of multiple media, including websites and brochures.

Steering Committee

Eleven of the fourteen members of the Steering Committee live or work in the City of Roseville. This body has provided a mechanism for continuing public involvement in the maintenance of the Plan by meeting annually to monitor the progress of the plan implementation and creating annual progress reports. The ongoing participation of some members from the time that the initial plan was developed provided a valuable historical perspective for

the committee during the update process. All Steering Committee meetings were open to the public and advertised on the City's hazard mitigation plan website. The Steering Committee met six times during the course of the plan update process. One of the meetings was attended by two members of the public. Steering Committee documentation can be found in Appendix C.

Survey

The Steering Committee elected to use a survey for the update process to collect new information from the public about household preparedness for hazards, the level of knowledge about tools and techniques for reducing loss from hazards, and areas of public concern about hazards.

The Steering Committee reviewed the previous survey and requested a simplification of the process to keep residents engaged while ensuring the collection of useful information. The survey asked 26 quantifiable questions and provided opportunities for written comment. The final survey used some of the same questions asked on the initial survey, which helped to show whether citizens' perception of risk and vulnerability has changed over the last five years. The survey also revised some questions to support the plan update process and fulfill the Steering Committee's request for simplification.

The web-based survey tool "Survey Monkey" was used to set up and deploy the survey. The survey was made available to all citizens of Roseville via a web-link posted on the City's website, advertised via press releases, sent via e-mail to community residents, and linked through various forms of social media, including Nextdoor, a geographically based social media website. Over 670 surveys were completed during the course of the plan update process. These results were distributed to the Steering Committee during the strengths, weaknesses, obstacles and opportunities session to inform the Steering Committee of public concerns and opportunities for new public engagement strategies. Multiple survey respondents indicated concern about radon, which the Steering Committee will consider adding as a hazard of concern during the next plan update. The survey and a summary of its findings are provided in Appendix A.

Public Meetings

Participation in a well-attended community event was used as the vehicle to introduce the plan update process, to share the results of the revised risk assessment, and to gauge the public's perception of risk. A final public hearing was held at the end of the process to provide the public an opportunity to comment on the draft Plan.

Community Event Participation—Public Meeting

A public meeting was held as part of the City of Roseville's Earth Day celebration on Saturday, April 16, 2016 from 10 a.m. to 3 p.m. at the Utility Exploration Center, 1501 Pleasant Grove Boulevard (see Figure 3-1 through Figure 3-4). The public meeting was an open-house-format meeting, allowing citizens to come and go as they pleased during the meeting time frame.

The principal objective of the meeting was to share the results of the revised risk assessment with the public, then gage their perception of risk by having them complete a survey. Multiple members of the Steering Committee and planning team were present to speak with residents and answer questions about the process and their risk. Hazus-MH work stations were set up, allowing citizens to see information on their property, including exposure and damage estimates for earthquake and flood events. The 20 property owners who elected to receive a risk assessment were provided printouts of this information for their properties. This tool was highly effective in illustrating risk to the public. This Earth Day event was well attended, with thousands in attendance. During this event, the planning team recorded direct contact and discussion regarding the Plan with 50 event attendees. One resident, a local veterinarian, requested additional information to share with her clients which was later provided to her in electronic form by the City.

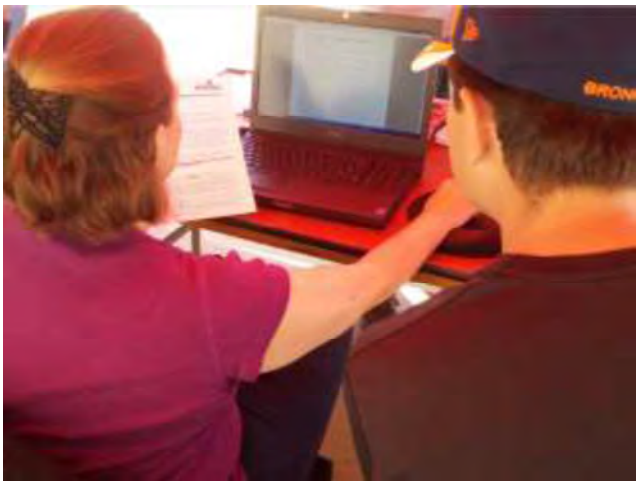

Figure 3-3. Hazus-MH Work Station

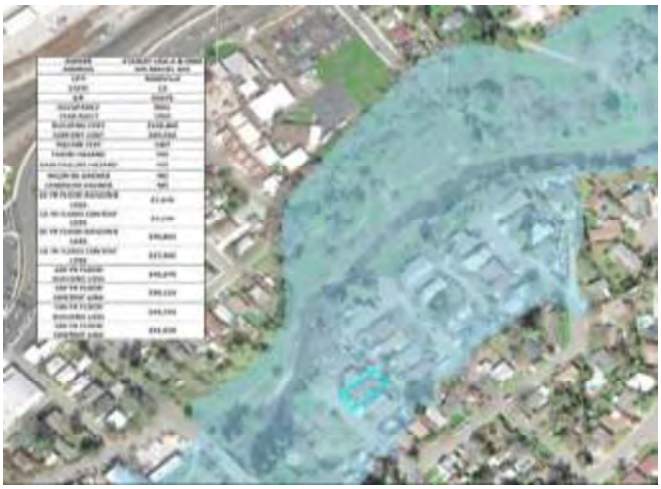

Figure 3-4. Sample Printout from Work Station

Public Comment Period

Once the draft updated Plan was assembled, a comment period for public input was open from August 2, 2016 through August 19, 2016. The public comment period was advertised via the City website, a press-release, and through the use of social media. A public comment link was established on the City's Hazard Mitigation Plan website. During this public comment period, the City received one comment from the public on the Draft Plan regarding the dam failure chapter. This comment requested additional information regarding exposure and vulnerability to the hazard. The City of Roseville decided to address the comment directly with the individual with no change to the plan for dam facility operational security and safety. A copy of the exchange is available upon request.

Use of Media

Press Releases

Press releases were distributed over the course of the 2016 Plan's development as key milestones were achieved and prior to each public meeting.

Social Media

Social media was identified by the Steering Committee as an appropriate method for spreading public messages. The Steering Committee decided to use multiple platforms to reach a variety of audiences:

- Twitter is a messaging platform that allows users to send brief messages to followers (Figure 3-5).
- Facebook is a social network that connects friends, businesses, and governments. The City of Roseville shared messages on its Public Safety Facebook page, allowing other government pages to share (Figure 3-6).
- Nextdoor is a neighborhood social network launched in 2013. On this platform, users must be confirmed members of a community. Once verified, neighbors can receive community updates from local government, share or sell unused goods, or coordinate community events. The City's public information specialists regularly used Nextdoor to engage Roseville's neighborhoods (Figure 3-7).

Internet

The City used its web-based capabilities to keep the public apprised of the plan update process. Upon completion of the initial Plan, a permanent hazard mitigation plan website was established on the Roseville website (see Figure 3-8):

www.roseville.ca.us/HazardPlan

This page can be accessed from the City's home page using the site's search engine. This page housed all pertinent information on the hazard mitigation plan, its progress, and its implementation status. This site has proven to be a highly effective measure for ongoing public access to the Plan. The update scope of work was posted on the website during the update process, along with announcements of all key milestones of the plan update development. Steering Committee meeting announcements, agendas and meeting minutes were also made available on the site. This website also was the principal means of disseminating the survey for the 2016 Plan.

3.3.2 Public Involvement Results

The public involvement strategy used for the plan update introduced the concept of mitigation to the public and provided the Steering Committee with feedback to use in developing the Plan. All citizens of Roseville were provided ample opportunities to provide comment during all phases of this plan update process. Details of attendance and comments received from the public meeting are provided in Appendix A and summarized in Table 3-2. Detailed analysis of the survey findings from the 671 electronically submitted surveys is presented in Appendix A.

Table 3-2. Summary of Public Meetings

Date	Location	Number of Citizens in Attendance	Number of Contacts Made
April 16, 2016	City of Roseville Earth Day	5,000	Over 50
August 2, 2016	Steering Committee Meeting – Public Draft	1	1

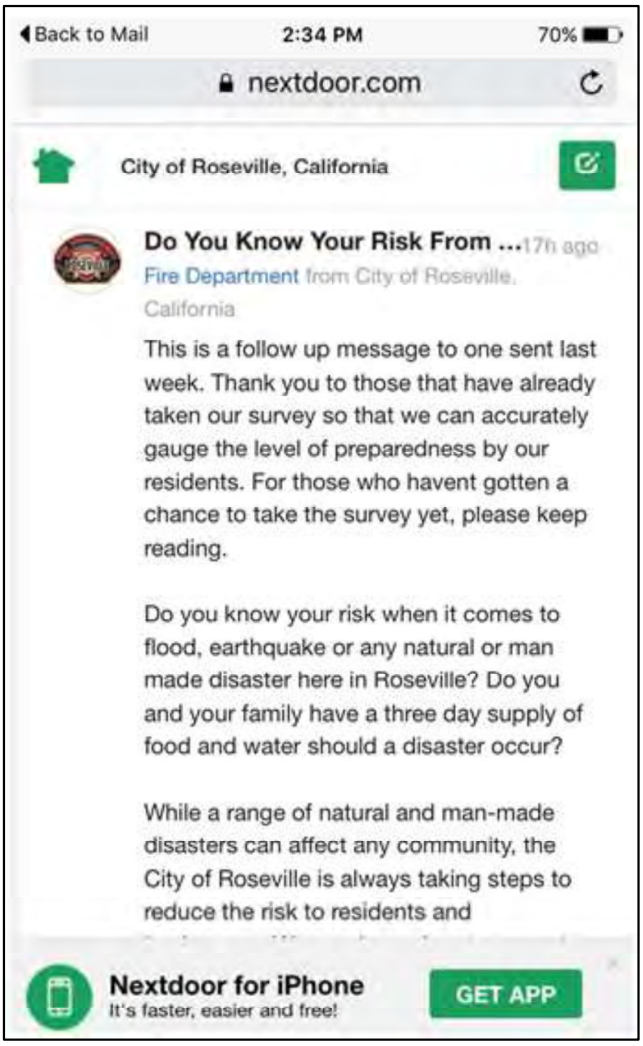

Figure 3-7. Nextdoor Survey Announcement

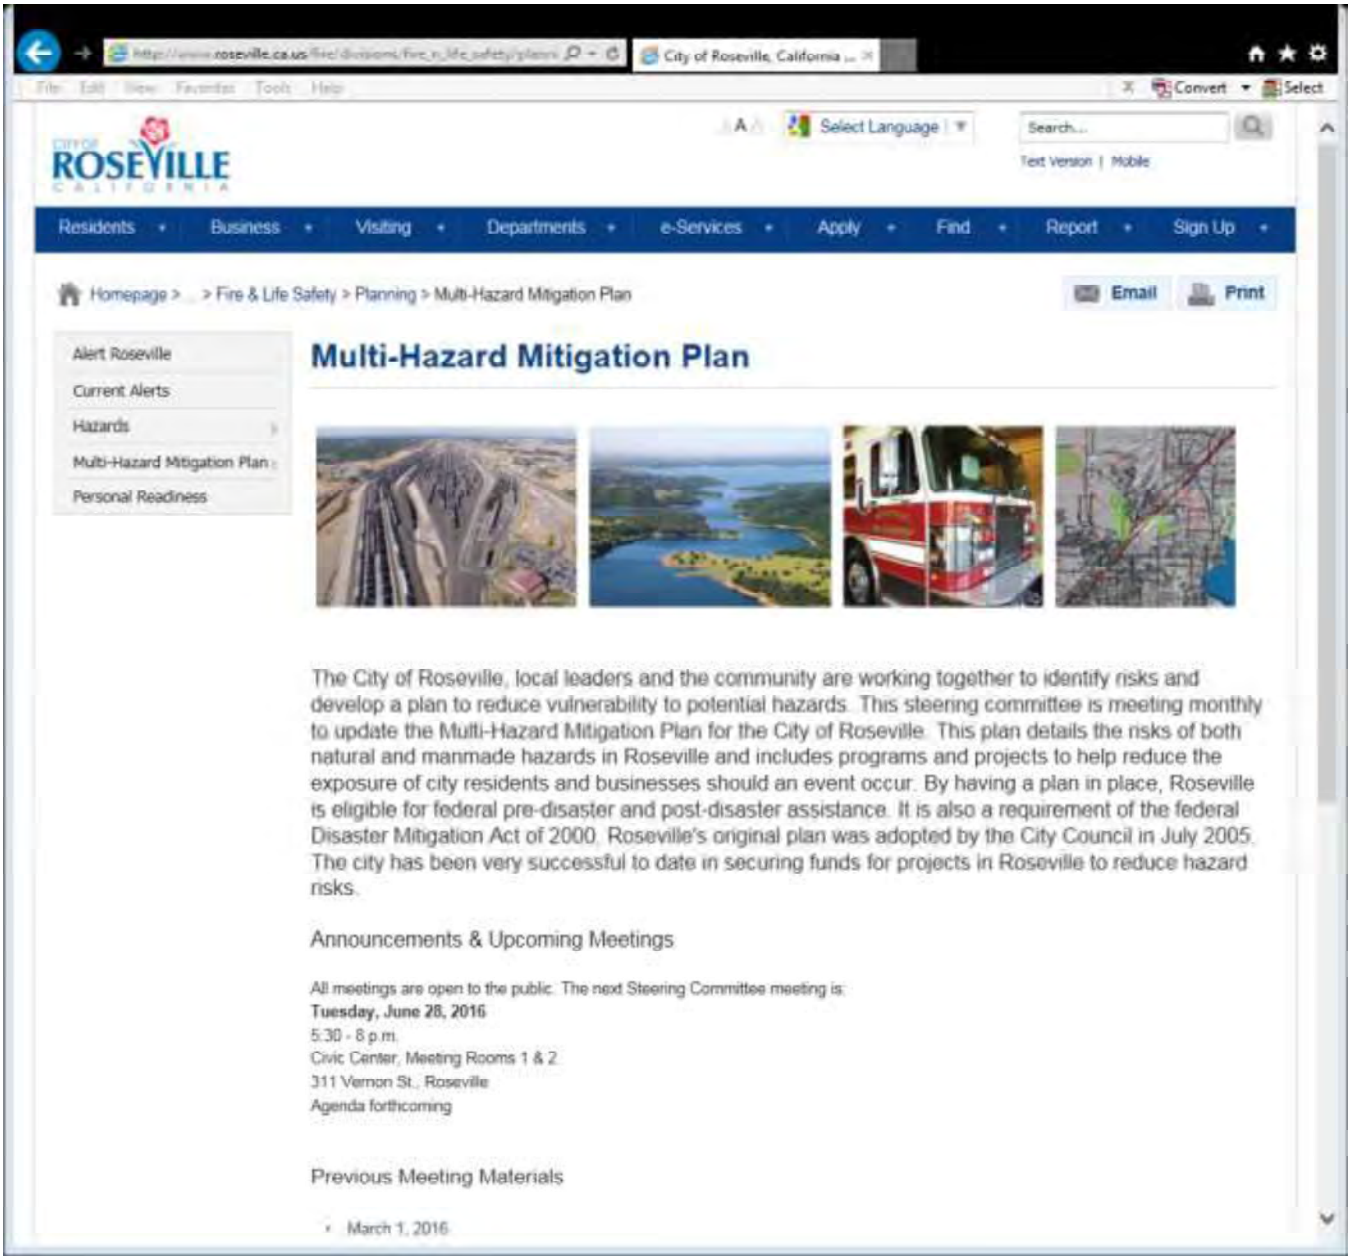

Figure 3-8. Sample Page from Hazard Mitigation Plan Website

3.4 ASSEMBLE THE UPDATED PLAN

The base format of the 2011 Plan was retained for the 2016 Plan. Enhancements were made to include the following components:

- The 2016 update provides a discussion on new mediums used to keep the public apprised of the Plan's actions during the project performance period.
- The 2016 update describes the need for changes to the risk assessment and what changes were made in comparison to the previous plan update.
- The update describes changes to risk exposure due to either of the following:

  - Successful mitigation projects
  - Changes in land use due to annexation or new development.

- The 2016 update describes changes to the action plan and the reasons for them.
- The 2016 update identifies completed, deleted, or deferred actions or activities from the previously approved plan as a benchmark for progress.
- The 2016 Plan includes in its evaluation and prioritization new mitigation actions identified since the previous plan update.
- To be compliant with California Senate Bill 379, the 2016 hazard mitigation plan includes linkage with the City's General Plan. The bill requires the update to include a set of goals, policies, and objectives based on a vulnerability assessment, identification of the risks that climate change poses to the local jurisdiction and the geographic areas at risk from climate change impacts, and specified information from federal, state, regional, and local agencies.

3.5 PLAN DEVELOPMENT CHRONOLOGY/MILESTONES

Table 3-3 summarizes important milestones in the plan update process.

Table 3-3. Plan Development Chronology/Milestones

Date	Event	Description	Attendance
2014			
9/23	CRS re-verification visit	City undergoes its re-verification visit as the nation's only CRS Class 1 community. The Class 1 is re-verified by this process.	N/A
2015			
10/18	Selection of Tetra Tech as plan facilitation consultant through sole source contract	Technical assistance secured	N/A
11/3	1st Steering Committee meeting	Reconfirm Steering Committee organization/ground rules Review the plan update work plan Risk assessment update Review progress reports and state plan	13
11/30	2nd Steering Committee meeting	Progress Report Recommendations Hazards of Concern Confirmation Guiding Principle/Vision/Mission Statement Confirm Goals and Objectives Public Involvement Strategy	14
2016			
1/5	3rd Steering Committee Meeting	Risk Assessment Update Public Involvement Strategy Critical Facilities Definition General Plan Update Emergency Operations Plan Review Debris Management Plan	17
2/2	4th Steering Committee Meeting	Risk Assessment Update Public Involvement Strategy, Survey Finalization Public Involvement, PPI Alternatives Analysis	15
2/8	Survey Deployment	The public survey was deployed via multiple platforms including City websites, Facebook, Nextdoor, Twitter, and public announcement.	N/A
3/1	5th Steering Committee meeting	Risk assessment update Public Involvement Strategy Update, Public Meeting (Strengths, weaknesses, obstacles and opportunities)	16
4/16	Public information open house—Roseville Earth Day	Public open house held at the Roseville Earth Day Festival at Mahany Park outside of the Roseville Utility Exploration Center, 1501 Pleasant Grove Boulevard, Roseville from 10:00 AM to 4:00 PM. Risk assessment data shared with the public as well as distribution of hazard specific information.	50
8/2	6th Steering Committee meeting/Public Review Meeting	Review the public draft and launch the public comment period for the 2016 Plan	13
8/19	Public Comment Period Ends	Draft Plan posted on Hazard Mitigation Plan website. Press release advertising public comment period	N/A
9/01	Plan review	Plan sent to Cal OES and ISO for review and approval pending adoption (APA)	N/A
TBD	Final public meeting and Plan adoption	APA Plan presented to City Council for adoption. The public was provided opportunity to provide comment prior to formal adoption.	##
TBD	CRS approval	Plan was approved by ISO for CRS credit at ___ points	N/A
TBD	Final approval	FEMA granted final approval of the adopted plan	N/A

4. CITY OF ROSEVILLE PROFILE

4.1 GEOGRAPHIC PROFILE

The City of Roseville lies to the west of the foothills of the Sierra Nevada Range, about 16 miles northeast of downtown Sacramento. It is the largest city in Placer County and has experienced considerable residential and commercial growth in the past two decades.

The focus of this Hazard Mitigation Plan is the primary planning area defined in the *City of Roseville General Plan 2035*. The planning area includes 43.39 square miles of incorporated lands and an additional 796 acres making up the City's sphere of influence, as shown in Figure 4-1. It is divided into smaller areas called "Specific Plan Areas" for which more detailed individual plans have been developed to implement the General Plan. The City of Roseville is unusual in that 14 specific plans have been adopted. These Plan Areas contain detailed design guidelines and development agreements to guide development and ensure that development is funded and built as planned.

Roseville is largely urbanized. The greatest area of undeveloped property is in the western portion of the City, which includes the remainder of the developing West Roseville Specific Plan, as well as planned specific Plan Areas including Sierra Vista, Creekview and Amoruso Ranch. The incorporated area and sphere of influence are the primary focus of General Plan policies, but "secondary planning areas" also bear relationship to Roseville planning efforts, depending on the planning issue. For example:

- For the issue of air quality, the secondary planning area includes the City and all areas outside the City that are within the associated Sacramento Valley air basin.
- For flood protection, the secondary planning area encompasses the complete drainage basins of surface waters that flow through Roseville.
- Other secondary planning areas encompass varying boundaries beyond the primary planning area for issues such as solid waste, recycling, transportation and wastewater treatment.

The City's area is characterized by gently sloping terrain with areas of steep ravines in the northeast, and relatively flat valley on the western portion of the City. It is segmented by topographical and physical features, including streams, natural parkways, open space, Interstate 80 and Highway 65, the Union Pacific railroad, and industrial facilities. Traffic is directed around several of these topographical features by bridges and an underpass. These limitations may create traffic congestion and delay emergency response. Heavy traffic congestion at peak commute times on the City's major roadways acts as a barrier to timely response for emergency services. In the event of an accident or other emergency at one of the key intersections between a road and a stream, freeway, or railway, sections of the City could be isolated or have response time slowed.

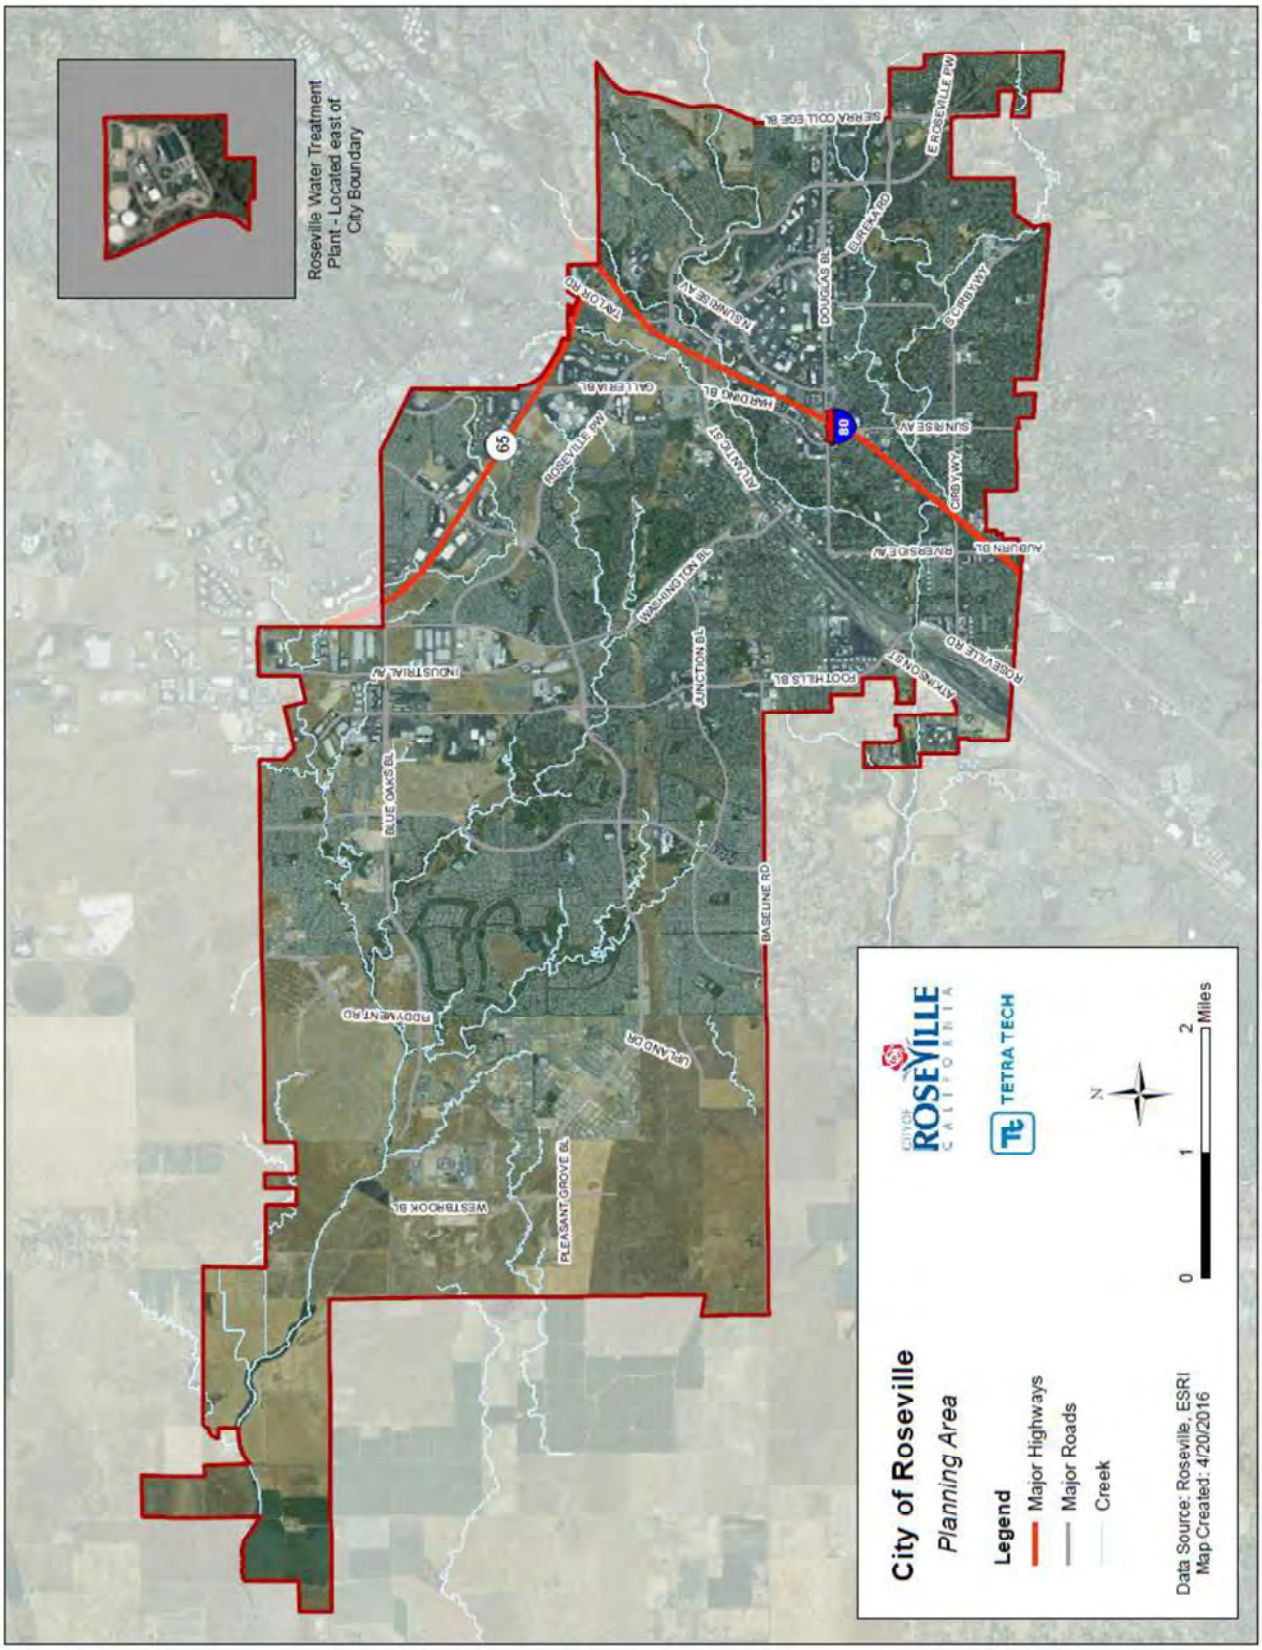

Figure 4-1. Roseville Planning Area

4.2 HISTORICAL OVERVIEW

4.2.1 Pre-Development

The Placer County region was first inhabited by the Maidu Indians, whose territory extended from the Sacramento River Valley to the Sierra Nevada Range. The Southern Maidu occupied the American River basin, along with the Bear and Yuba River basins in the area now recognized as the City of Roseville. An abundance of plants and animals supported the Maidu tribes' large population. Evidence of the Maidu communities still exists along the banks of Strap Ravine and Dry Creek.

4.2.2 Founding of the Community

Fur trapping expeditions came to the area in the early 1800s, and James Marshall discovered gold in the region in 1848. Some of the miners who came in search of gold became the area's first pioneers, taking up farming along the fertile creeks. Eventually, disease, gold miners and early settlers killed or forcibly removed the Maidu from their traditional lands. By 1864, track-laying crews from the Central Pacific Railroad had pushed eastward from Sacramento building the western half of the nation's first transcontinental railroad line. At the site of today's Roseville, the rails of the Central Pacific intersected with those of the California Central, a small line which then linked the towns of Folsom and Lincoln. The place where the two lines joined was labeled on railroad maps as "The Junction." The small freight and passenger center called Roseville developed around the junction.

For many years, Roseville remained a small railroad shipping point of about 250 inhabitants, centered on the train depot and a few small businesses and houses lining the two principal streets, Atlantic and Pacific. This changed between 1906 and 1908, when railroad roundhouse and repair facilities were moved to Roseville from nearby Rocklin. By 1908, the population increased to 2,000. New subdivisions were laid out to accommodate newcomers, many of whom moved from Rocklin. The business district expanded along Lincoln, Main, Church, and Vernon Streets. A chamber of commerce was organized to provide municipal services such as water, electricity, police and fire protection. In April 1909, the town incorporated and began to grow until it became Placer County's largest city.

4.2.3 Post-Incorporation Development

Railroad expansion continued, and local businesses grew as well. In the 1920s, the Pacific Fruit Express ice plant was the world's largest artificial ice plant. Also by the 1920s, the Southern Pacific Railroad boasted the largest freight marshaling yards west of the Mississippi River at Roseville. By the start of the Great Depression in 1929, Roseville's population had risen to 6,425.

During World War II, thousands of troop and munitions trains made their way through Roseville. The City continued to boom as a railroad center into the post-war years, but by the 1950s it faced competition from airlines and interstate trucking. The introduction of jet aircraft and the construction of Interstate 80 through Roseville caused the once-booming passenger train service to decline abruptly. The local depot was closed in 1972 and razed the following year. The Pacific Fruit Express ice plant closed in 1974, rendered obsolete by the introduction of self-refrigerating shipping options.

Completion of Roseville Community Hospital in 1952, the Folsom Dam in 1955, and the Roseville Freeway (Interstate 80) in 1956 gradually shifted the population away from downtown Roseville to what would become known as East Roseville. Roseville Square, the town's first shopping complex, was completed in 1961. Today, Roseville has more than 28 million square feet of commercial, office, and industrial floor space, and is ranked 10th statewide in total taxable retail sales.

In 1964, Roseville was selected as one of Look magazine's All America Cities. Roseville experienced a population surge in the 1980s as developers built up its broad expanses of cheap open land with easy transportation access. As the population expanded, so did the need for water, electrical, sewage, police, fire protection, recreational and educational services.

4.2.4 Current Conditions

The City has continued to grow outward. An expansive industrial zone lies north of Roseville adjacent to Highway 65, along with numerous corporate headquarters along Douglas Boulevard and the Johnson Ranch Road area. Although Roseville is no longer just a railroad town, the railroad remains a major factor in the local economy, and Roseville is still one of the principal railroad centers of the West. Passenger service was reintroduced in 1987 and a new intermodal depot facility was completed.

Today Roseville is an emerging urban center with a mix of residential and employment uses. The center of the City is typified by the downtown and small lot, single-family residences, while newer commercial and office development and larger suburban-type residences characterize the edges of town. As of January 2016, the California Department of Finance estimated the City's population to be 134,073—a 61-percent increase since 2000. It is anticipated that Roseville, along with the remainder of the South Placer/Sacramento Region, will continue to be the focus of significant development. Currently, the focus of new development is along the eastern, western, and northern portions of the community.

4.3 MAJOR PAST HAZARD EVENTS

Presidential disaster declarations are typically issued for hazard events that cause more damage than state and local governments can handle without assistance from the federal government, although no specific dollar loss threshold has been established for these declarations. A presidential disaster declaration puts federal recovery programs into motion to help disaster victims, businesses and public entities. Some of the programs are matched by state programs. Table 4-1 lists the presidential major disasters and other federal declarations since 1950 that have affected Placer County, according to Placer County's Multi-Hazard Mitigation Plan, Cal OES, and FEMA.

Review of these events helps identify targets for risk reduction and ways to increase a community's capability to avoid large-scale events in the future. Many natural hazard events do not trigger federal disaster declaration protocol but have significant impacts on their communities. These events are also important to consider in establishing recurrence intervals for hazards of concern.

4.4 PHYSICAL SETTING

4.4.1 Geology

Roseville is within the Great Valley and Sierra Nevada geomorphic provinces of California. Located on the east side of the Sacramento Valley, Roseville's geology consists of water deposited (alluvial) sediments from the erosion of the Sierra Nevada mountain range.

4.4.2 Soils

Soils in Roseville include some Quaternary (less than 1.8 million years old) sands, sandstones and mudstones, some Upper Tertiary (1.8 to 24 million years old) sandstones, mudstones and limestone, some Lower Tertiary (24 to 64 million years old) mudstones and sandstones, and Franciscan melange and serpentinite. These soils tends to be very dense or in some areas, soft rock. Some Quaternary muds, sands, gravels, silts and mud are located along 100-year floodplains. Soils in Roseville also include mehrten lava flow, which restricts permeability.

4.4.3 Climate

Roseville and the northern Central Valley have a Mediterranean climate with warm, dry days and cool nights during the summer, when the average temperature is 93ºF during the day and 57ºF at night. In 2001, the California Energy Commission developed climate zones based on energy use, temperature, and other factors and created representative temperature data for each zone. Roseville is located in Zone 11: Red Bluff. As a whole, Zone 11 experiences sharply defined seasons with summers consisting of almost constant sunshine and dry air and winters with piercing winds and thick ground fog.

Table 4-2 presents a summary of annual climate conditions. Precipitation from May through October is rare, with most of the rainfall in the Greater Sacramento area, including Roseville, occurring between November and April. Prevailing winds in the summer can be light to gusty from the south. In the late summer and early fall, several wind events typically occur, with northerly winds that cause critical fire weather conditions in the City and surrounding areas.

4.5 DEVELOPMENT PROFILE

4.5.1 Land Use Policies

In addition to a considerable jump in residential growth, Roseville has experienced considerable growth in commercial and industrial development. Based on growth projections and current land use allocations in the General Plan, the City has sufficient development potential through 2035 for both residential and commercial uses. Typically residential land uses will be built out well before complete buildout of nonresidential land could occur, anticipated after 2050.

Table 4-2. Roseville Climate

	Average High Temperature (°F)	Average Low Temperature (°F)	Record High Temperature (°F)	Record Low Temperature (°F)	Total Inches of Precipitation

Source: The Weather Channel

Numerous factors will influence growth throughout the South Placer County/Sacramento region:

- General economic conditions of the state
- Federal and state budget issues and cutbacks
- Competition from other growth areas
- Perceptions about the quality of life
- Housing costs and availability
- Employment opportunities
- Infrastructure and resource availability.

Management of the City's growth is guided by the Land Use Element of Roseville's General Plan, which consists of a land use map and land use policies. The overall goal of the Land Use Element is to promote a balanced and innovative land use pattern that retains and enhances the distinct character and identity of Roseville. It is organized into the following six components:

- **Existing Conditions and Projections—**Provides a description of the planning area, an existing land use inventory, and future projections.
- **Land Use Designations, Definitions and Standards—**Identifies and defines the City's land use categories, incorporating general use, development, intensity, siting, and compatibility standards.
- **Community Form—**Provides goals and policies to define and direct the future form and pattern of the City. Issues addressed include community character; relationship to transit and pedestrian uses; air quality; downtown and neighborhoods; jobs and housing; economic development; community involvement; and inter-jurisdictional coordination.
- **Community Design—**Includes goals and policies that address aesthetics and function; the integration of the built and natural environment; and community character. Emphasis is on the development of a design framework that reflects the City's goal of high quality, community-wide design.
- **Growth Management—**Focuses on the proactive management of growth in the community. Included is the identification of performance standards to regulate potential future growth areas. Policies addressing annexations and expansion of the City's sphere of influence are also included.

- **Relationship to Specific Plans—**Discusses the interrelationship between the General Plan and the City's Specific Plans.

The land use map included in the Land Use Element generally shows the City's existing and planned land use mix and pattern. The total land use allocation at buildout is shown in Figure 4-2. The land use map reflects only those policies that can be graphically shown. Land use decision-making is guided not only by the land use map but also by the goals, policies and implementation measures in the Land Use Element.

Source: City of Roseville, General Plan, 2015

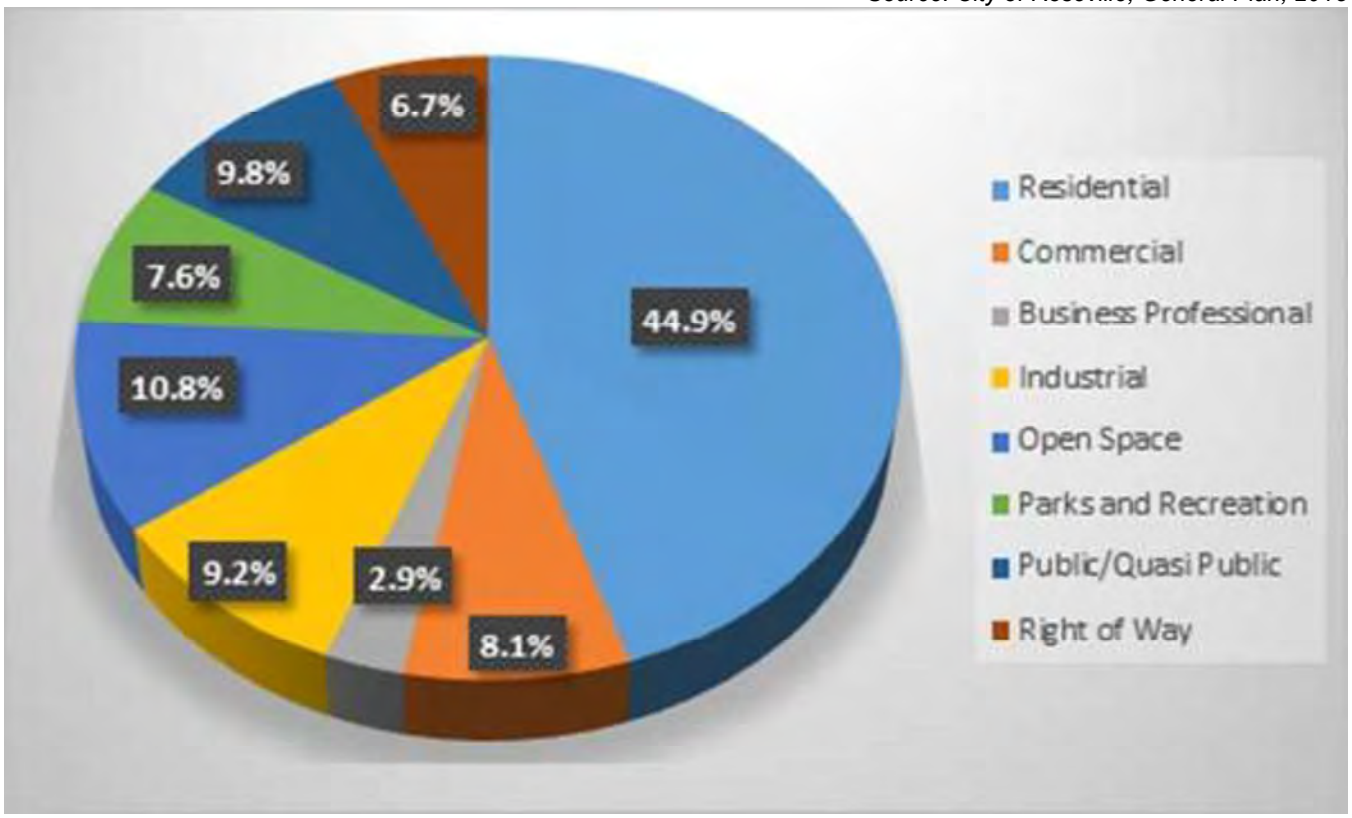

Figure 4-2. Total Land Use Allocation in Roseville

The City's land use policies are built upon underlying principles that were established based on input the City received from its residents and the Growth Management Committee established in 2005. These principles have impacted the overall policy direction and land use pattern in the City of Roseville. They include the following:

- Promote and enhance Roseville's unique character and identity.
- Distinguish Roseville from adjacent communities through the quality of development and design, and the level of public services and facilities provided.
- Protect and enhance Old Town/ Downtown and the City's established neighborhoods.
- Promote new development as an integrated and connected part of the City's land use pattern.
- Provide a variety of housing types and opportunities, including those for all income groups.
- Create a balanced land use pattern with an appropriate mix of uses to accommodate resident employment, service, and social needs within the community.
- Promote a land use pattern that provides a high level of open space and recreational amenities and is sensitive to the natural environment.

- Create a land use mix and pattern that accommodates and promotes alternative transportation modes for ease of access and improved air quality.
- Proactively manage and plan for growth.
- Ensure that new development is fiscally neutral, and does not impact existing residents.

State, regional and local growth projections indicate that Roseville and the South Placer County/Sacramento region will continue to draw residential and employment growth. Much of this attraction can be attributed to desirable location and access, availability of an educated and skilled workforce, land costs and overall quality of life. Local and regional economic conditions will drive the local growth potential, and existing land use allocations may require modification in the near future.

4.5.2 Residential Development

The Land Use Element of the General Plan identifies three primary residential land uses:

- **Low-Density Residential—**The low-density residential land use category is for development of the single-family dwelling units that make up the majority of Roseville's housing supply. The lower densities are assigned to lands that require flexibility to accommodate development constraints (e.g., slopes, trees, etc.). Typically, low-density residential lands should require minimal grading or disturbance of natural features.
- **Medium-Density Residential—**The medium-density residential land use category is for small-lot single-family detached dwelling units and attached patio homes, half-plexes, townhouses, condominiums, and mobile home parks. This residential land use accommodates a variety of housing types and designs, and is often used as a transition or buffer between higher intensity land uses and low-density residential land use. It may also be applied as a transition between higher volume roadways and lower density residential uses.
- **High-Density Residential—**The high-density residential land use category is normally developed with multiple-story apartment or condominium structures containing multiple attached dwelling units. The broad range of densities in this category yields a variety of design options. In some areas, this land use category may be combined with commercial uses to form a mixed-use development where higher densities are desirable and beneficial.

According to the State Department of Finance, there are 51,590 housing units in the City. Single-family detached homes made up over 75 percent of the housing stock as of January 2016. Multi-family homes made up 24 percent, and mobile homes accounted for less than 1 percent. Residential construction valuation reached $208,581,000 in 2015. The Building Division reported that $19,111,000 in new construction was completed during the 2015 – 2016 fiscal year. The Placer County Association of Realtors provided statistics indicating that the median purchase price of single-family houses and condominiums in Roseville rose approximately 9 percent between May 2015 and May 2016, from $391,500 to $425,000 and $168,500 to $178,300, respectively. As indicated by the increase in housing prices, the demand for single-family homes continues and available land for single-family homes is ample.

4.5.3 Non-Residential Development

Roseville's non-residential land use designations include areas designated for commercial, office, industrial uses, special areas, and combining districts. Special designations include Central Business District, Public and Quasi-Public uses, Parks and Recreation, Open Space, and Urban Reserve. Like the residential designations, each non-residential designation includes a purpose statement, primary and secondary uses, and development standards, including a floor area ratio. Unlike the specific secondary uses listed for residential designations, which are intended to be subordinate and may be permitted only to support neighborhood convenience, the non-residential land use designations permit secondary land uses that are supportive and complementary of the primary uses, not

necessarily subordinate. Typically, the size of secondary uses is limited and therefore does not warrant a separate land use designation. Table 4-3 summarizes the non-residential land uses. A summary of non-residential development in Roseville is given in Table 4-4.

Table 4-3. Non-Residential Land Uses

Land Use	Purpose
Neighborhood Commercial	The neighborhood commercial land use designation is intended to provide basic commercial services for the convenience of surrounding neighborhoods within walking distance of major residential areas.
Community Commercial	The community commercial land use designation is distinguished from the neighborhood commercial designation by providing a broader range of goods and services to an expanded service area.
Regional Commercial	The regional commercial land use designation is intended to accommodate larger shopping centers and commercial activities where uses provide goods and services to a citywide and regional service area.
Business Professional	The business professional land use designation provides areas for small and large office uses, including uses supportive of offices.
Light Industrial	The light industrial land use designation is applied to lands reserved for office, industrial, and research and development uses that generate very limited noise, vibration, odor, dust, smoke, light, or other pollutants, and are either integrated or compatible with surrounding uses.
General Industrial	The general industrial land use designation is intended to provide areas for industrial uses that tend to generate noise, vibration, odor, dust, smoke, light, and an aesthetic appearance not compatible with residential and other sensitive receptors. The intent of this category is to provide a place for industrial uses within the City that is properly buffered from other uses.
Central Business District	The Central Business District is a distinct land use category that acknowledges land use patterns of significantly greater intensities and traditional mixed uses of retail, office, and apartment. The district is limited in its application to Central Roseville, the West Roseville Village Center, and areas of greater urban intensity.
Open Space	The open space land use designation is used to preserve and protect public and private lands that are significant due to wildlife habitat, natural features, or flood hazard. Within new development areas, the 100-year floodplain boundaries will be designated as Open Space. In addition, sensitive or unique natural features, including, but not limited to, wetlands, vernal pools, and oak woodlands, are to be designated as open space as part of specific plans and other major development review processes.
Public/Quasi-Public	The public/quasi-public land use designation is used to establish areas for education, religious assembly, governmental offices, municipal corporation yards, and water treatment plants.
Urban Reserve	The urban reserve land use designation is applied to lands that are anticipated to receive urban land entitlements, but at the present time are constrained by growth management policies, availability of services or other limitations.
Park/ Recreation	The park and recreation designation is used to identify public parks in Roseville
Floodplain	The floodplain designation identifies lands that are within the 100-year floodplain boundaries as defined in the Safety Element of the General Plan. Development of lands with a floodplain land use designation is strictly regulated by the City of Roseville. In areas with existing development, the floodplain designation is an overlay or combining land use. As part of a specific plan, the land use designation may be combined with an open space or parks designation, if found consistent with the policies of the Safety Element.
Study Area	The study area land use designation is used as a combining land use to identify future General Plan or neighborhood study areas. This combining designation may be applied to any area where the City believes that additional land use analysis and amendment of the General Plan may be desirable to resolve specific neighborhood or land use issues.
Village Center	The Village Center land use designation is intended allow for a mix and density of land uses common to a traditional downtown, urban setting. It allows for flexibility and deviation from the standards and permitted uses contained in the primary land use designation for which it is combined.
Transfer Station	The transfer station land use designation is intended to preserve and protect industrial areas suitable for a solid waste transfer station.

Table 4-4. Non-Residential Development Profile as of July 2016

Activity/Use	Total Developed Building Area (square feet)	Total Area Zoned for Use (acres)
Commercial	11,249,499	2,249
Office	8,080,479	802.69
Industrial	8,997,392	2,369
Public/Quasi Public	2,037,310	2,702

4.5.4 Critical Facilities and Infrastructure

Critical and essential facilities and infrastructure are those that are critical to the health and welfare of the population. These become especially important after a hazard event. The Steering Committee created the following definition specific to Roseville, regarding which facilities are considered critical:

> *A structure or other improvement, public or private, that, because of its function, size, service area, or uniqueness, has the potential to cause serious bodily harm, extensive property damage, or disruption of vital socioeconomic activities if it is destroyed or damaged or if its functionality is impaired. Critical facilities may include, but are not limited to, health and safety facilities, utilities, government facilities, hazardous materials facilities, and transportation infrastructure.*

The location of critical facilities and infrastructure in the planning area is shown on Figure 4-3 through Figure 4-5. Due to the sensitivity of this information, a detailed list of facilities is not provided. The list is on file with the City of Roseville. Table 4-5 and Table 4-6 provide summaries of the general types of critical facilities and infrastructure, respectively.

Table 4-5. Planning Area Critical Facilities

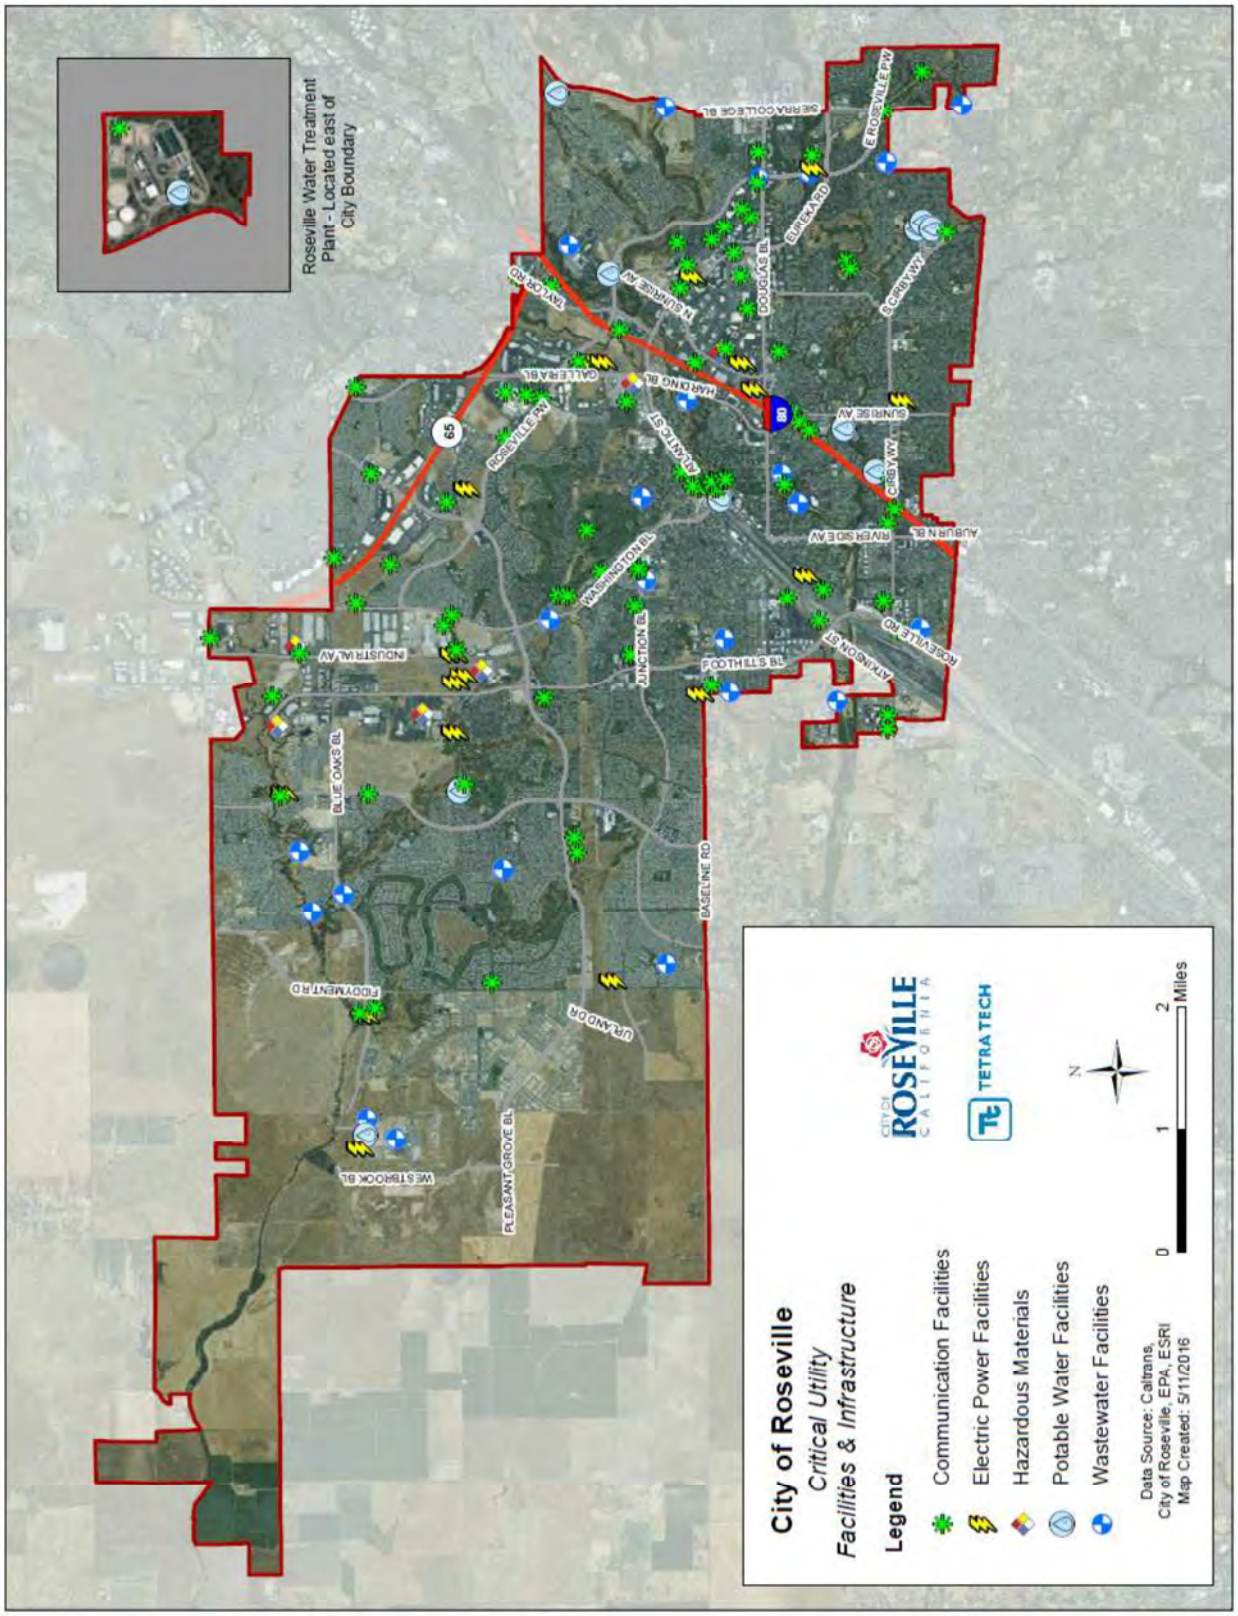

Figure 4-5. Critical Infrastructure in the Planning Area—Utilities

4.5.5 Future Trends in Development

The Roseville General Plan and associated specific area plans govern land use decision and policy-making. Decisions on land use will be governed by these programs. This Plan will work together with these programs to support wise land use in the future by providing vital information on the risk associated with natural hazards in the planning area. The City of Roseville will incorporate by reference the updated Hazard Mitigation Plan in the Safety Element of its General Plan. In addition to proactively planning for the implementation of Senate Bill (SB) 379 upon the next plan update process (see Section 4.9 for a discussion of this state law), this incorporation will ensure that all future trends in development can be established with the benefits of the information on risk and vulnerability to natural hazards identified in this Plan.

4.6 OPEN SPACE AND HABITAT

The City recognizes that open space land is limited and that valuable resources must be conserved wherever possible. For many, the City's open space setting is a highly valued natural resource. Given the strong interrelationship between open space and conservation issues, the City of Roseville has chosen to address these issues in a single element of its General Plan: the Open Space and Conservation Element. Vegetation and wildlife resources and corridors are an important component of the overall open space system and have been the historical focus of preservation efforts in Roseville. If future generations are to enjoy and benefit from the resources available to the present generation, these finite and fragile resources must be preserved and managed.

The vegetation and wildlife resources of Roseville can be broadly classified by habitat type—grasslands, oak woodlands, riparian areas, and seasonal wetlands—as discussed below. Whenever possible, the focus of preservation efforts is multipurpose. It is therefore preferred, for example, to preserve woodlands, grasslands, and wetlands in combined rather than separate and unconnected settings.

4.6.1 Grasslands

Relatively small amounts of self-sustaining grasslands remain in the northern and western undeveloped edges of Roseville. Less extensive areas of grassland are present in smaller undeveloped areas scattered throughout the City. Before Spanish and later settlers arrived in the Central Valley, the grasslands contained native species. The effects of grazing and clearing of large tracts for agriculture resulted in the decline of native species. Today, most of the grasslands in the region contain non-native species. These areas do, however, provide important habitat for birds and other wildlife.

4.6.2 Oak Woodlands and Riparian Areas

Oak woodlands are generally present near the City's major stream channels. The microclimates and alluvial soils in the woodlands provide ideal conditions for deep-rooting shrubs and trees. Most woodland areas are relatively open, with little shrub growth.

Riparian areas support a much wider biological diversity. Situated along and within the City's creeks and watercourses, riparian corridors are a source of food and water and provide cover, nesting sites, and migration and dispersal corridors for wildlife. Riparian areas are also important in flood protection and improve air and water quality through natural filtering.

Oak woodland and riparian areas are City resources not only because of the diversity of species they support but also because they provide natural open space and aesthetic value. The City's creek systems are described in detail in the groundwater recharge and water quality component of the Open Space and Conservation Element. The City regulates the protection of native oak trees through the Tree Preservation Ordinance, which includes standards that limit disturbance within protected zones of oaks and emphasizes avoidance of tree removal. Where avoidance

is not feasible and tree removal is authorized by the City, mitigation is required on an inch-for-inch basis. The Tree Preservation Ordinance is a valuable tool in protecting Roseville's oak trees and habitats. A creek and riparian management and restoration plan is being developed that will provide standards for riparian area management and enhancement. Additionally, the City maintains an overarching management plan for upholding the City's requirements in maintaining open space.

4.6.3 Seasonal Wetlands

Many of the wetland areas in Roseville are seasonal and therefore receive, retain, and transport water only during the wet season. Wetlands are subject to the regulations of the U.S. Army Corps of Engineers under the provisions of Section 404 of the Clean Water Act. Two primary types of seasonal wetlands are present in the City: intermittent drainage and vernal pool wetlands.

Intermittent drainage wetlands typically consist of channels 1 to 10 feet wide that flow over a variety of substrata. Most are wet only during winter and transport runoff. They are typically dry during summer, with scattered ponds, but they may contain water from adjacent urban runoff.

Vernal pools represent a significant seasonal wetland resource in Roseville. Although relatively abundant in Roseville and the Sacramento/Placer County region, they are considered rare statewide for their limited natural occurrence and distribution and for the unique native plant and animal species they support. Found in valley grassland areas, vernal pools are typically small, shallow, hardpan-floored depressions that fill with water during the winter wet season, gradually drying by late spring or early summer. Several plant species occur only in association with these special habitats, which has triggered concern about their inventory and preservation. Two types of vernal pools are present in the Roseville area:

- Northern volcanic mud flow vernal pools occur in shallow depressions on Mehrten mud flow formations where the slope is generally less than 2 percent.
- Northern hardpan pools generally occur on the Inks or Cometa soil series at the lower basin portions of creek floodplains. During the wet season, the pools provide special habitat for unique plant and animal species whose germination, growth, and reproductive cycles coincide with the availability of collected water. Individual pools vary significantly in the length of time they remain wet and in the diversity of plant species present.

4.6.4 Sensitive Species

The California Department of Fish and Wildlife maintains the California Natural Diversity Data Base, which includes known locations of state and federally listed endangered, rare, and threatened plant and animal species, including species considered by the scientific community to be deserving of such listing.

The sensitive plant species that may be present in Roseville are primarily associated with vernal pool environments and include the following: Bogg's Lakehedge Hyssop (*Gratiola heterosepala*), Dwarf Downingia *(Downingia humilis*), and Vernal Pool Brodiaca (*Dichelostemma lacunavernalis*). Bogg's Lake Hyssop is listed as endangered by the state and California Native Plant Society. Dwarf Downingia and Vernal Pool Brodiaca are both included on the California Native Plant Society "watch list" and have sufficiently limited distribution to warrant continued monitoring. Vernal pools in the City may also contain federally listed, endangered vernal pool tadpole shrimp (*Lepidurus packardi*) and federally listed threatened vernal pool fairy shrimp (*Branchinecta lynchi*).

Anadromous chinook salmon (*Oncorhynchus tshawytscha*) and Central Valley steelhead (*Oncorhynchus mykiss*) are known to be present seasonally in Dry Creek and its upper tributaries. Steelhead is listed by the U.S. Fish and Wildlife Service as a threatened species under the Endangered Species Act. Chinook salmon within the Central Valley Fall/Late Fall Run are listed as a candidate species. In addition to the federal and state classified rare or

endangered wildlife species known to inhabit Roseville, favorable habitats for other listed species are present in the area. Other special status species potentially present in Roseville include Cooper's Hawk, Swainson's Hawk, Valley Elderberry, Longhorn Beetle, Sanford's Arrowhead, and the Northwestern Pond Turtle. Bald eagles have been sighted near Folsom Lake, and the American peregrine falcon is present in the Sacramento Valley. All of these species thrive in the riparian habitats of floodplain environments.

Preservation of habitat for sensitive species benefits from the City of Roseville's Open Space Preserve Overarching Management Plan, as described in Section 4.9.3.

4.7 DEMOGRAPHICS

Some populations are at greater risk from hazard events because of decreased resources or physical abilities. Elderly people, for example, may be more likely to require additional assistance. Research has shown that people living near or below the poverty line, the elderly (especially older single men), individuals with disabilities, individuals with access and functional needs, women, children, ethnic minorities and renters all experience, to some degree, more severe effects from disasters than the general population. These vulnerable populations may vary from the general population in risk perception, living conditions, access to information before, during and after a hazard event, capabilities during an event, and access to resources for post-disaster recovery. Indicators of vulnerability often overlap spatially and often in the geographically most vulnerable locations. Detailed spatial analysis to locate areas where there are higher concentrations of vulnerable community members would help to extend focused public outreach and education to these most vulnerable citizens.

4.7.1 Population Trends

According to the California Department of Finance, Roseville's estimated population for 2015 was 134,073 and the estimated daytime population, which includes those coming into Roseville to work, shop, and do business, was 145,000. Roseville is the 45th largest of California's 482 cities. The City has been striving to accommodate growth while retaining and enhancing its distinct character.

The full-time population increased by 38,223 from 2000 to 2010, a 31.9-percent increase (see Figure 4-6). The 2010 population was more than four times that of 1982, when the City had 26,127 residents. The 2.6-percent growth rate from 2009 to 2010 was comparable to average annual growth rates of the past decade. This rate exceeded annual growth rates for Placer County (1.7 percent) and California (1.0 percent) for the same time period.

Between 2010 and the end of 2015, Roseville experienced an estimated 10.9 percent increase in population—averaging 2.2 percent per year. This trend indicates that the population of Roseville will continue to grow through the end of the decade, albeit more slowly than the population boom experienced between 2000 and 2010.

The average household size in Roseville is 2.61 persons, according to U.S. Census Bureau American Community Survey estimates for 2010-2014. This household average may vary by land use and location in the City. For example, the 3,814 age-restricted low-density residential units in the Del Webb and West Roseville planning areas have an estimated average household size of 1.8.

The General Plan's estimates of when Roseville will achieve buildout (the maximum development allowed by zoning) vary based on the methodology used. Under all scenarios, however, Roseville and the Placer County/Sacramento Metropolitan region are expected to remain attractive to both residential and commercial development. As growth rates continue to climb in the region, the City of Roseville has captured an increasing share of that growth. Considerable recent growth in Roseville is attributed to the annexation of the Sierra Vista Specific Plan Area of 2,064 acres and the Creekview Specific Plan of 500 acres in 2012.

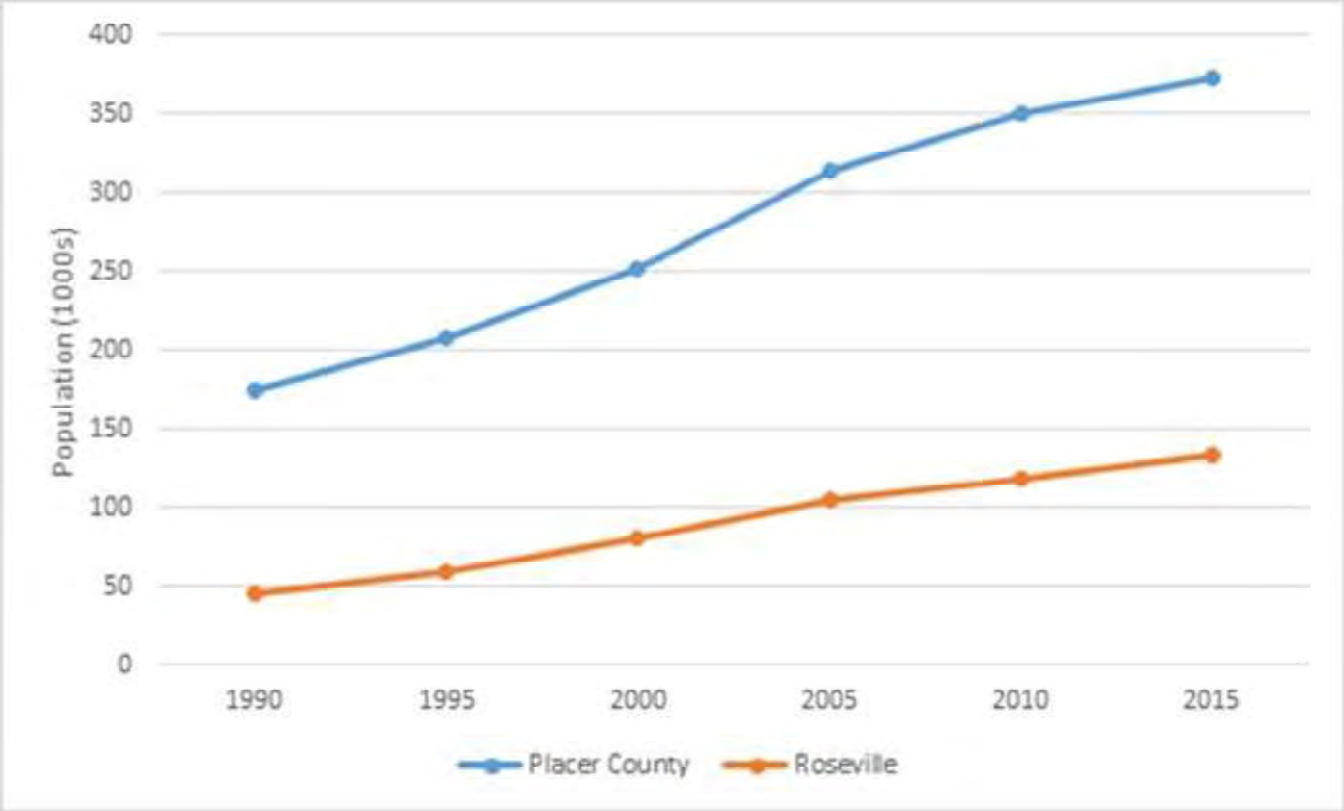

Figure 4-6. Placer County and Roseville Population Growth

Additionally, the City is in the process of annexing the 694-acre Amoruso Ranch Specific Plan, located on the northwest boundary of the City. Through buildout, these western specific Plan Areas are projected to experience the highest increase in population. The overall population, when all residential property is developed, is projected to be over 185,000. Table 4-7 shows the General Plan's population forecasts by Specific Plan Area.

4.7.2 Age Distribution

The vulnerability of elderly citizens can vary significantly based on health, age, and economic security. However, as a group, the elderly are more apt to lack the physical and economic resources necessary for response to hazard events and are more likely to suffer health-related consequences making recovery slower. They are more likely to be vision, hearing, and/or mobility impaired, and more likely to experience mental impairment.

Additionally, the elderly are more likely to live in assisted-living facilities where emergency preparedness occurs at the discretion of facility operators. These facilities are typically identified as "critical facilities" by emergency managers because they require extra notice to implement evacuation. Elderly residents living in their own homes may have more difficulty evacuating their homes and could be stranded in dangerous situations. This population group is more likely to need special medical attention, which may not be readily available during natural disasters due to isolation caused by the event. Specific planning attention for the elderly is an important consideration given the current aging of the American population.

Children under 14 are particularly vulnerable to disaster events because of their young age and dependence on others for basic necessities. Very young children may additionally be vulnerable to injury or sickness; this vulnerability can be worsened during a natural disaster because they may not understand the measures that need to be taken to protect themselves from hazards.

Table 4-7. General Plan Projections of Residential Units and Population by Specific Plan Area

	Dwelling Units			Population		
Specific Plan Area	2016	2035	Buildout	2016	2035	Buildout

Amoruso Ranch	0	2,827	2,827	0	7,379	7,379
Total	**49,190**	**71,751**	**76,383**	**125,332**	**184,054**	**196,180**

According to the 2010-2014 U.S. Census American Community Survey estimates, 14.3 percent of Roseville's population is 65 or older, 21.1 percent of the population is under the age of 14 and the median age is 37.5. Figure 4-7 shows the age distribution for Roseville.

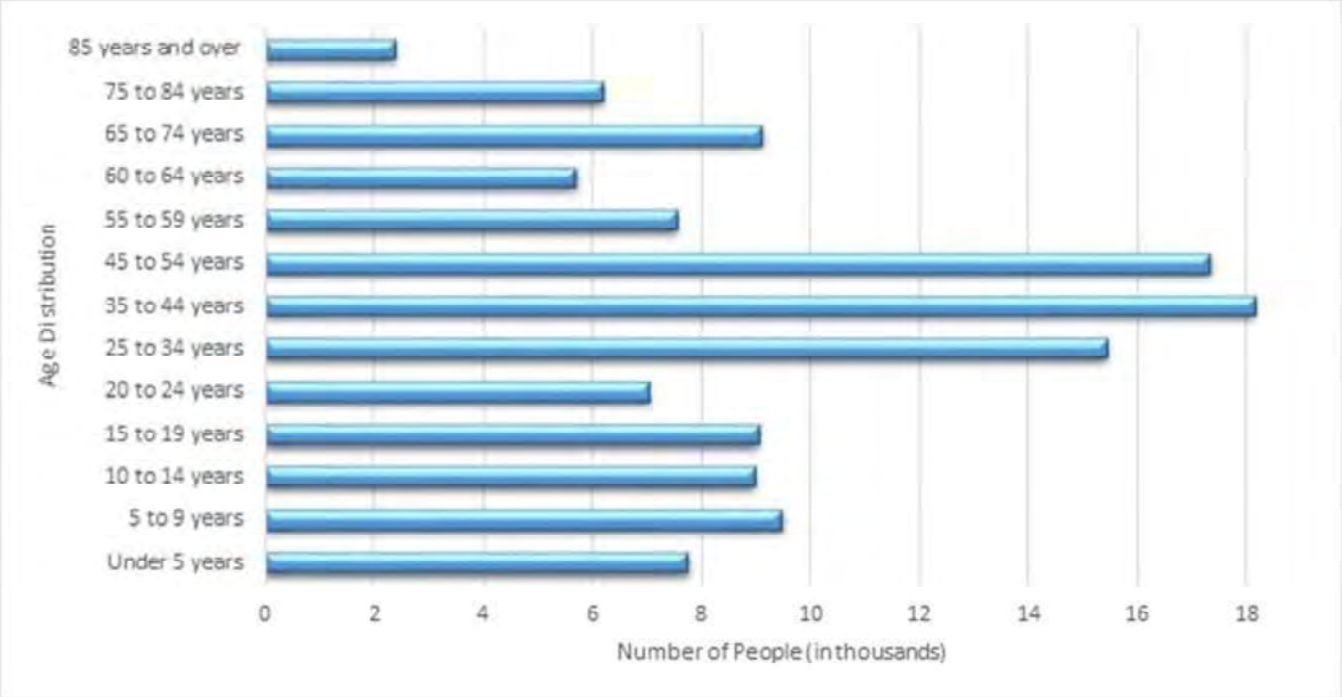

Figure 4-7. Planning Area Age Distribution

4.7.3 Race, Ethnicity and Language

Many disaster researchers have focused on the increased vulnerability that ethnic minorities experience in the United States. Research shows that minorities are less likely to be involved in pre-disaster planning and experience higher mortality rates during a disaster event. Post-disaster recovery can be ineffective and is often characterized by cultural insensitivity. Since higher proportions of ethnic minorities live below the poverty line than the majority white population, poverty can compound vulnerability.

According to the U.S. Census, Roseville's racial composition is predominately white, at about 80 percent of the City population. The largest minority population in Roseville is Hispanic, followed by Asian. Figure 4-8 shows the racial distribution of Roseville.

About 12 percent of Roseville's population is foreign-born, with the majority born in Latin America, according to 2014 U.S. Census estimates. Other than English, the most commonly spoken language in the City is Spanish. In the U.S. Census estimates, 5.6 percent of the City's residents reported speaking English "less than very well." Of the foreign born population, 38.5 percent speak English "less than very well." This has important implications for emergency managers, who must get crucial information out to all members of the population before, during and after emergency events.

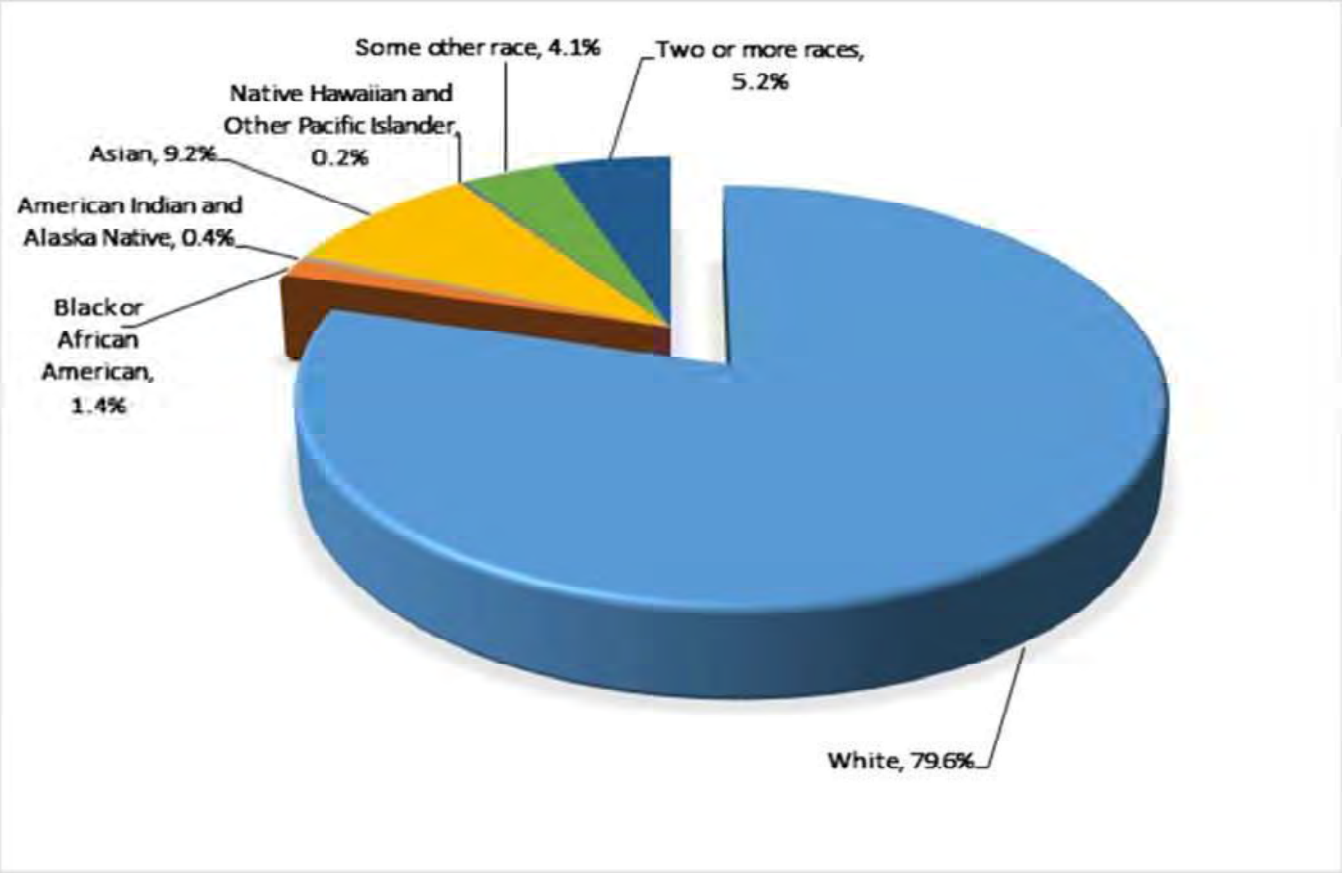

Figure 4-8. Planning Area Race Distribution

4.7.4 Individuals with Disabilities and Others with Access and Functional Needs

Individuals with disabilities and others with access and functional needs have a special stake in emergency planning because they are more likely to have difficulty responding to a hazard event than the general population. According to the 2010 U.S. Census, 12.3 percent of the U.S. noninstitutionalized population lives with a disability. As individuals with disabilities and others with access and functional needs are increasingly integrated into society, relatively large segments of the population may require assistance during the first 72 hours post-disaster, the period generally reserved for self-help.

Disabilities and access/functional needs can vary greatly in severity and permanence, making these individuals difficult to define and track. There is no "typical" disability or need, which can complicate disaster-planning processes that attempt to incorporate them. Furthermore, disabilities and access/functional needs are likely to be compounded with other vulnerabilities, such as age, economic disadvantage and ethnicity, all of which mean that housing is more likely to be substandard.

While the City of Roseville's percentage of individuals with disabilities and others with access and functional needs does not differ much from that of the state as a whole, the overall numbers are significant and warrant attention from planners and emergency managers (see Table 4-8). According to 2014 U.S. Census data, 10.3 percent of the City's population over the age of 5 has a disability.

Table 4-8. Status of Non-Institutionalized Population with Disabilities

Age	Individuals with Disabilities and Others with Access and Functional Needs	% of Age Group Population
5-17 years	1,065	4.7
18-64 years	5,038	7.2
65+ years	5,979	34.9

4.8 ECONOMY

4.8.1 Income

In the United States, individual households are expected to use some private resources to prepare for, respond to and recover from disasters. This means that households living in poverty are automatically disadvantaged when confronting hazards. Additionally, the poor typically occupy more poorly built and inadequately maintained housing. Mobile or modular homes, for example, are more susceptible to damage in earthquakes and floods than other types of housing. In urban areas, the poor often live in older houses and apartment complexes, which are more likely to be made of un-reinforced masonry, a building type that is particularly susceptible to damage during earthquakes. Furthermore, residents below the poverty level are less likely to have insurance to compensate for losses incurred from natural disasters. This means that residents below the poverty level have a great deal to lose during an event and are the least prepared to deal with potential losses. The events following Hurricane Katrina in 2005 illustrated that personal household economics significantly impact people's decisions on evacuation. Individuals who cannot afford gas for their cars will likely decide not to evacuate.

Based on U.S. Census American Community Survey estimates for 2014, per capita income in Roseville was $34,6514, and the median household income was $76,712. Table 4-9 compares the income and poverty estimates at the city, county, and state level. About 8.6 percent of Roseville residents are below the poverty level (meaning they spend more than a third of income on an economy food budget); this includes 10.2 percent of those under the age of 18 and 7.4 percent of those 65 or older.

Table 4-9. Population Under the Poverty Level

	Median Household Income	Percent of Total Population Below Poverty Level	Percent of Children (18 and Under) Below Poverty Level	Percent of Elderly (65 and Older) Below Poverty Level
City of Roseville	$76,712	8.6	10.2	7.4
Placer County	$73,747	8.9	11.2	6.8
California	$61,489	16.4	22.7	10.2

4.8.2 Industry, Businesses and Institutions

The planning area's economy is strongly based in the educational/healthcare/social service industry (22 percent), followed by the retail trade and professional/scientific industries. Information, wholesale trade, and agriculture make up the smallest sources of the local economy, with less than 1 percent of local economy driven by agriculture. Figure 4-9 shows the breakdown of industry types in the planning area.

The planning area benefits from a variety of business activity. Major businesses include Kaiser Permanente, Union Pacific Railroad, Adventist Health and Sutter Roseville Medical Center.

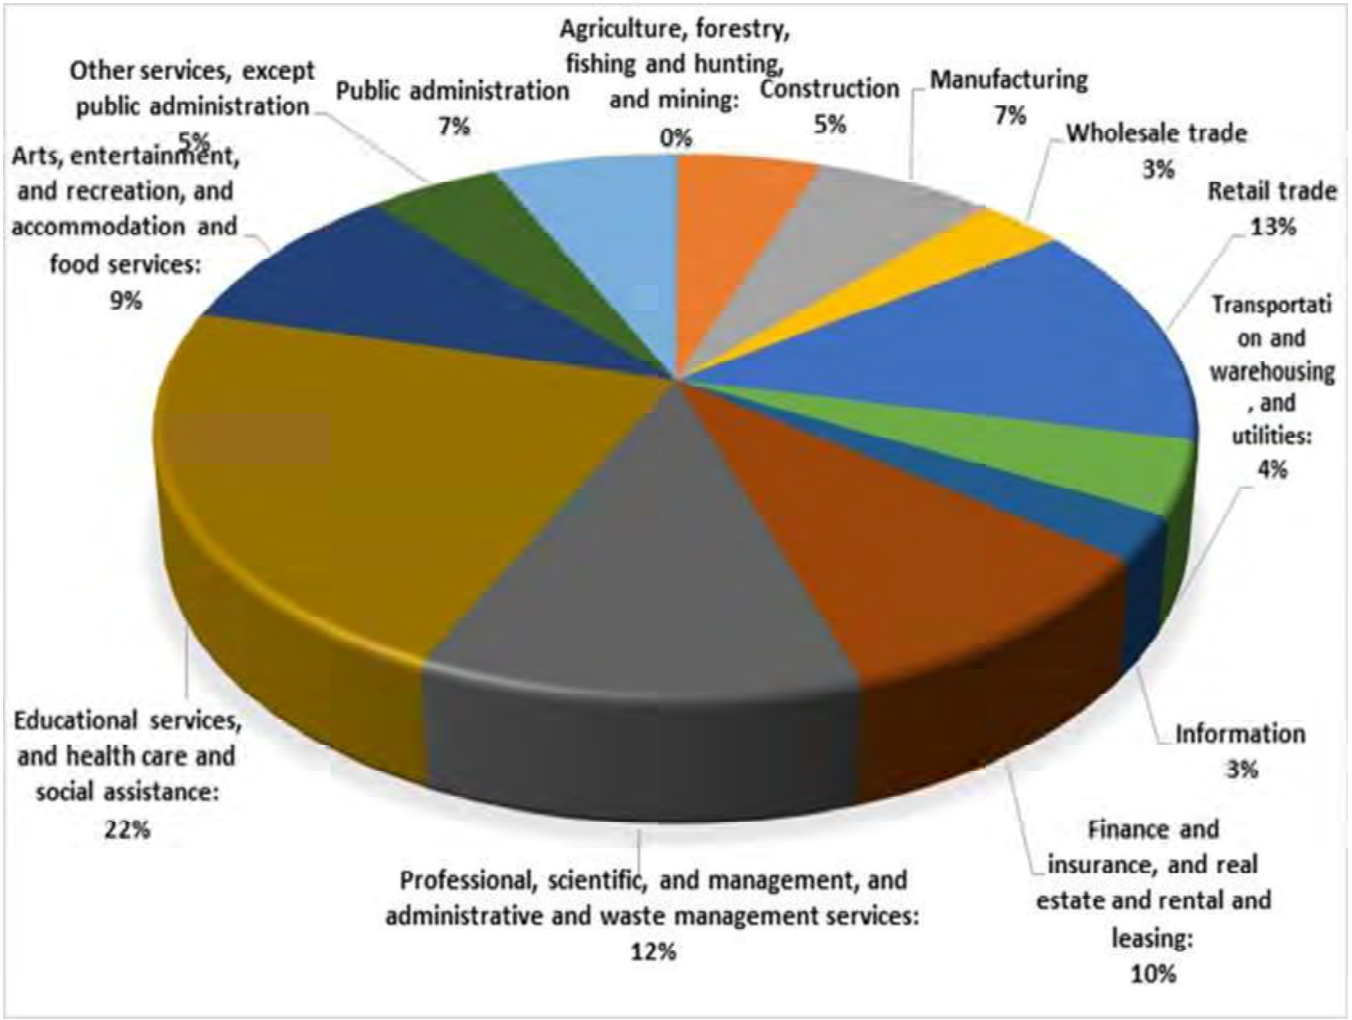

Figure 4-9. Industry in the Planning Area

4.8.3 Employment Trends and Occupations

According to the American Community Survey, about 48.4 percent of the planning area's population is in the labor force. Of the working-age population group (ages 20 – 64), 88.5 percent of men and 75.6 percent of women are in the labor force. Figure 4-10 compares California's and Roseville's unemployment trends from 2009 through 2014. Roseville's unemployment rate was lowest in 2009, at 5.9 percent. Unemployment rates significantly dropped from 9.5 percent to 8.3 percent between 2013 and 2014.

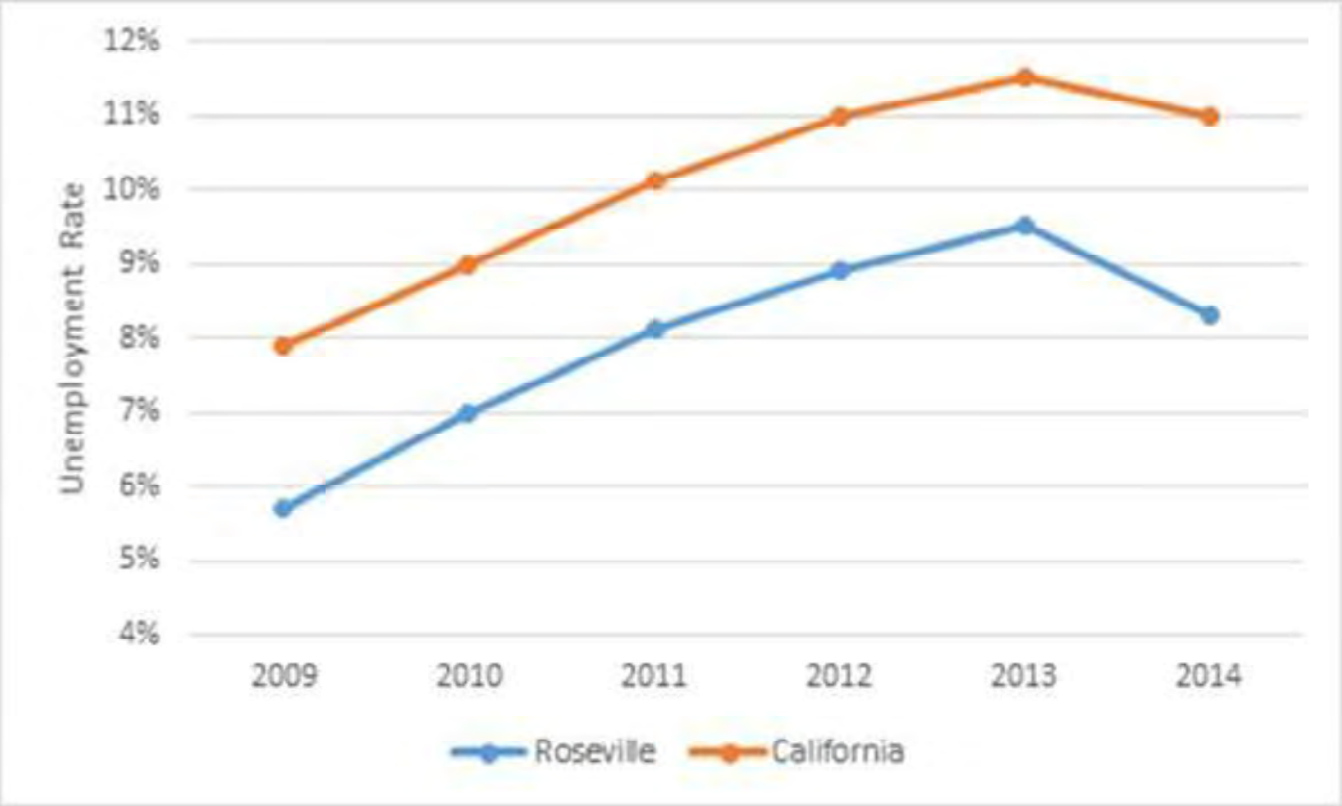

Figure 4-10. California and Roseville Unemployment Rate (U.S. Census, 2009 – 2014)

Management, business, science and arts occupations and sales and office occupations make up 72 percent of the jobs in the planning area (see Figure 4-11). Service occupations make up 16 percent of the local working population.

As of October 2014, the largest employer is Kaiser Permanente, with 3,231 employees, followed by Hewlett-Packard, which employs 2,132. Other major employers include the following:

- Sutter-Roseville Medical Group
- Roseville Joint Union High School District
- Union Pacific Railroad Company
- Adventist Health System West
- Roseville City School District
- City of Roseville
- Wal-Mart Superstore (PG Blvd)
- LB Construction, Inc.

The U.S. Census estimates that over 79.6 percent of workers in the planning area commute alone (by car, truck or van) to work, and mean travel time to work is 26.1 minutes (the state average is 27.6 minutes).

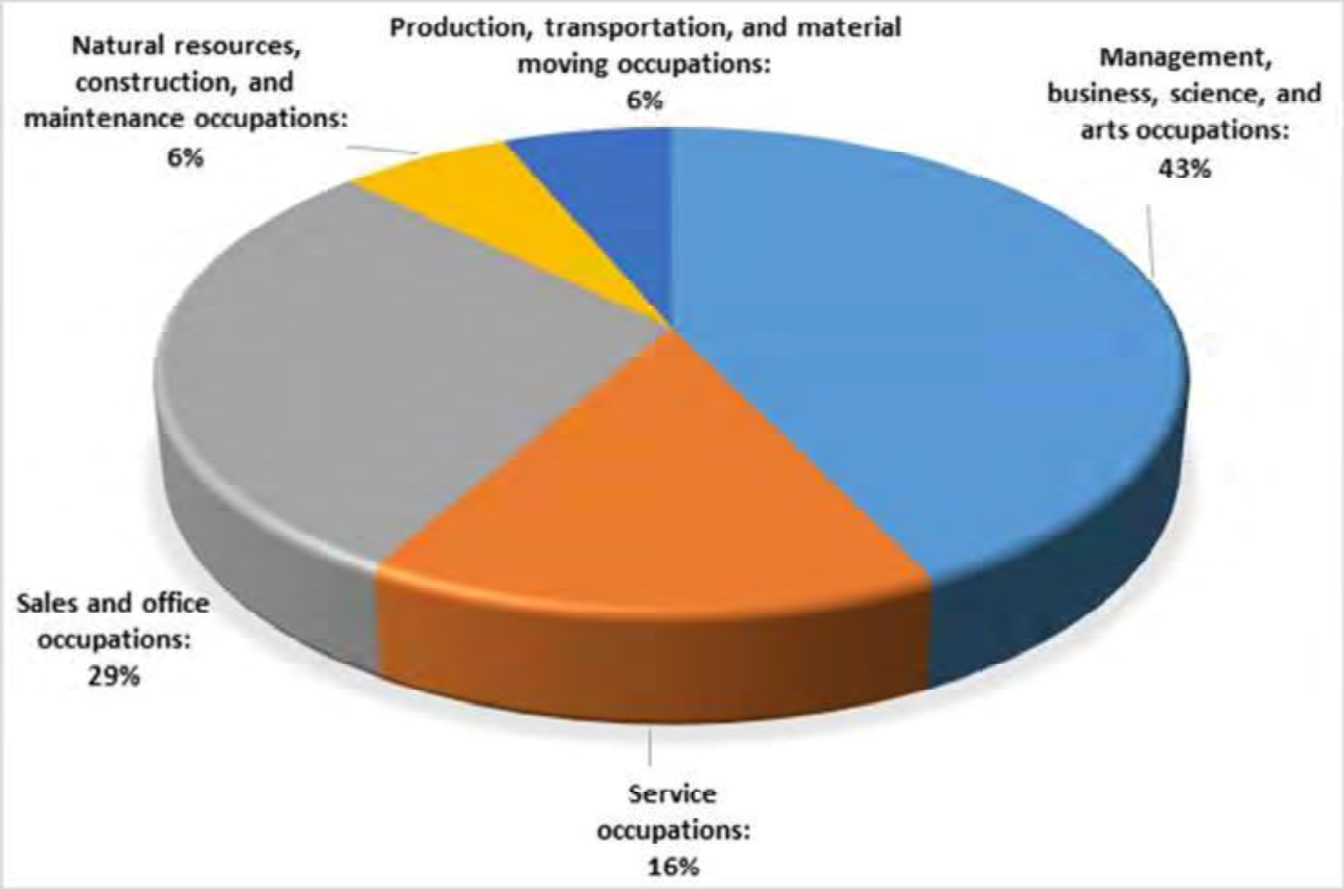

Figure 4-11. Occupations in the Planning Area

4.9 LAWS AND ORDINANCES

Existing laws, ordinances and plans at the federal, state and local level can support or impact hazard mitigation actions identified in this Plan. Hazard mitigation plans are required by 44 CFR to include a review and incorporation, if appropriate, of existing plans, studies, reports, and technical information as part of the planning process (Section 201.6.b(3)). The following federal, state, and local laws described below were reviewed to inform this plan update process. Not all laws and ordinances reviewed during this process are relevant to the immediate process of plan development. In such instances, the City will assure compliance, where relevant, upon implementation of programs that overlap with the requirements of the following programs at project implementation.

4.9.1 Federal

Disaster Mitigation Act of 2000

The DMA is the latest federal legislation addressing hazard mitigation planning. It reinforces the importance of mitigation planning and emphasizes planning for disasters before they occur. It specifically addresses planning at the local level, requiring plans to be in place before Hazard Mitigation Grant Program funds are available to communities. The 2016 Plan is designed to meet the requirements of the DMA.

Endangered Species Act

The Endangered Species Act (ESA) was enacted in 1973 to conserve species that are facing depletion or extinction and the ecosystems that support them. The act sets forth a process for determining which species are threatened and endangered and requires the conservation of the critical habitat in which those species live. The ESA provides broad protection for species of fish, wildlife and plants that are listed as threatened or endangered. Provisions are made for listing species, as well as for recovery plans and the designation of critical habitat for listed species. The ESA outlines procedures for federal agencies to follow when taking actions that may jeopardize listed species and contains exceptions and exemptions. It is the enabling legislation for the Convention on International Trade in Endangered Species of Wild Fauna and Flora. Criminal and civil penalties are provided for violations of the ESA and the Convention.

The purposes of the ESA are to provide a means of conserving the ecosystems upon which endangered and threatened species depend; to provide a program for conserving those species; and to take steps necessary to achieve the purposes of international treaties and conventions. The policy of Congress is that federal agencies must seek to conserve endangered and threatened species and use their authorities in furtherance of the ESA's purposes. The ESA defines three fundamental terms:

- **Endangered** means that a species of fish, animal or plant is "in danger of extinction throughout all or a significant portion of its range." (For salmon and other vertebrate species, this may include subspecies and distinct population segments.)
- **Threatened** means that a species "is likely to become endangered within the foreseeable future." Regulations for a threatened species may be less restrictive than if it were endangered.
- **Critical habitat** means "specific geographical areas that are…essential for the conservation and management of a listed species, whether occupied by the species or not."

Five sections of the ESA are of critical importance to understanding it:

- **Section 4: Listing of a Species—**The National Oceanic and Atmospheric Administration Fisheries Service (NOAA Fisheries) is responsible for listing marine species; the U.S. Fish and Wildlife Service is responsible for listing terrestrial and freshwater aquatic species. The agencies may initiate reviews for listings, or citizens may petition for them. A listing must be made "solely on the basis of the best scientific and commercial data available." After a listing has been proposed, agencies receive comment and conduct further scientific reviews for 12 to 18 months, after which they must decide if the listing is warranted. Economic impacts cannot be considered in this decision, but it may include an evaluation of the adequacy of local and state protections. Critical habitat for the species may be designated at the time of listing.
- **Section 7: Consultation—**Even when a listing has only been proposed, all federal agencies must ensure that any action they authorize, fund, or carry out is not likely to jeopardize the continued existence of a listed species or adversely modify its critical habitat. This includes private and public actions that require a federal permit. Once a final listing is made, non-federal actions are subject to the same review, termed a "consultation." If the listing agency finds that an action will "take" a species, it must propose mitigations or "reasonable and prudent" alternatives to the action; if the proponent rejects these, the action cannot proceed.
- **Section 9: Prohibition of Take—**It is unlawful to "take" an endangered species, including killing or injuring it or modifying its habitat in a way that interferes with essential behavioral patterns, including breeding, feeding or sheltering.
- **Section 10: Permitted Take—**Through voluntary agreements with the federal government that provide protections to an endangered species, a non-federal applicant may commit a take that would otherwise be prohibited as long as it is incidental to an otherwise lawful activity (such as developing land or building a road). These agreements often take the form of a "Habitat Conservation Plan."

- **Section 11: Citizen Lawsuits—**Civil actions initiated by any citizen can require the listing agency to enforce the ESA's prohibition of taking or to meet the requirements of the consultation process

The Clean Water Act

The Clean Water Act (CWA) is the cornerstone of surface water quality protection in the United States. (The Act does not deal directly with groundwater or with water quantity issues.) The statute employs a variety of regulatory and non-regulatory tools to sharply reduce direct pollutant discharges into waterways, finance municipal wastewater treatment facilities, and manage polluted runoff. These tools are employed to achieve the broader goal of restoring and maintaining the chemical, physical, and biological integrity of the nation's waters so that they can support "the protection and propagation of fish, shellfish and wildlife and recreation in and on the water."

Evolution of CWA programs over the last decade has included a shift from a program-by-program, source-by-source, pollutant-by-pollutant approach to more holistic watershed-based strategies. Under the watershed approach, equal emphasis is placed on protecting healthy waters and restoring impaired ones. A full array of issues are addressed, not just those subject to CWA regulatory authority. Involvement of stakeholder groups in the development and implementation of strategies for achieving and maintaining state water quality and other environmental goals is another hallmark of this approach.

National Flood Insurance Program

The National Flood Insurance Program (NFIP) provides federally backed flood insurance in exchange for communities enacting and enforcing floodplain regulations. Since its inception in 1968, the NFIP has been successful in requiring new buildings to be protected from probable damage by 100-year flood events. Requirements for participation in this program are stipulated in Parts 59 through 79 of 44 CFR. At the time of the preparation of this Plan, the City is in good standing with the requirements of the NFIP. Participation and good-standing under NFIP are prerequisites for funding eligibility under the Robert T. Stafford Act.

National Incident Management System

The National Incident Management System (NIMS) is a systematic approach for government, nongovernmental organizations, and the private sector to work together to manage incidents involving hazards. The NIMS provides a flexible but standardized set of incident management practices. Incidents typically begin and end locally, and they are managed at the lowest possible geographical, organizational, and jurisdictional level. In some cases, success depends on the involvement of multiple jurisdictions, levels of government, functional agencies, and emergency responder disciplines. These cases necessitate coordination across a spectrum of organizations. Communities using NIMS follow a comprehensive national approach that improves the effectiveness of emergency management and response personnel across the full spectrum of potential hazards (including natural hazards, terrorist activities, and other human-caused disasters) regardless of size or complexity.

Americans with Disabilities Act and Amendments

The Americans with Disabilities Act (ADA) seeks to prevent discrimination against people with disabilities in employment, transportation, public accommodation, communications, and government activities. Title II of the ADA deals with compliance with the Act in emergency management and disaster-related programs, services, and activities. It applies to state and local governments as well as third parties, including religious entities and private nonprofit organizations.

The ADA has implications for sheltering requirements and public notifications. During an emergency alert, officials must use a combination of warning methods to ensure that all residents have all necessary information. Those with hearing impairments may not hear radio, television, sirens, or other audible alerts, while those with visual impairments may not see flashing lights or visual alerts. Two technical documents issued for shelter

operators address physical accessibility needs of people with disabilities as well as medical needs and service animals.

The ADA intersects with disaster preparedness programs in regards to transportation, social services, temporary housing, and rebuilding. Persons with disabilities may require additional assistance in evacuation and transit (e.g., vehicles with wheelchair lifts or paratransit buses). Evacuation and other response plans should address the unique needs of residents. Local governments may be interested in implementing a special-needs registry to identify the home addresses, contact information, and needs for residents who may require more assistance.

Civil Rights Act of 1964

The Civil Rights Act of 1964 prohibits discrimination based on race, color, religion, sex or nation origin and requires equal access to public places and employment. The Act is relevant to emergency management and hazard mitigation in that it prohibits local governments from favoring the needs of one population group over another. Local government and emergency response must ensure the continued safety and well-being of all residents equally, to the extent possible.

Rural Development Program

The mission of the U.S. Department of Agriculture (USDA) Rural Development Program is to help improve the economy and quality of life in rural America. The program provides project financing and technical assistance to help rural communities provide the infrastructure needed by rural businesses, community facilities, and households. The program addresses rural America's need for basic services, such as clean running water, sewage and waste disposal, electricity, and modern telecommunications and broadband. Loans and competitive grants are offered for various community and economic development projects and programs, such as the development of essential community facilities including fire stations (USDA, 2015b).

Community Development Block Grant Disaster Resilience Program

In response to disasters, Congress may appropriate additional funding for the U.S. Department of Housing and Urban Development Community Development Block Grant programs to be distributed as Disaster Recovery grants (CDBG-DR). These grants can be used to rebuild affected areas and provide seed money to start the recovery process. CDBG-DR assistance may fund a broad range of recovery activities, helping communities and neighborhoods that otherwise might not recover due to limited resources. CDBG-DR grants often supplement disaster programs of the Federal Emergency Management Agency, the Small Business Administration, and the U.S. Army Corps of Engineers. Housing and Urban Development generally awards noncompetitive, nonrecurring CDBG-DR grants by a formula that considers disaster recovery needs unmet by other federal disaster assistance programs. To be eligible for CDBG-DR funds, projects must meet the following criteria:

- Address a disaster-related impact (direct or indirect) in a presidentially declared county for the covered disaster
- Be a CDBG-eligible activity (according to regulations and waivers)
- Meet a national objective.

Incorporating preparedness and mitigation into these actions is encouraged, as the goal is to rebuild in ways that are safer and stronger.

Emergency Watershed Program

The USDA Natural Resources Conservation Service (NRCS) administers the Emergency Watershed Protection (EWP) Program, which responds to emergencies created by natural disasters. Eligibility for assistance is not dependent on a national emergency declaration. The program is designed to help people and conserve natural

resources by relieving imminent hazards to life and property caused by floods, fires, wind-storms, and other natural occurrences. EWP is an emergency recovery program. Financial and technical assistance are available for the following activities (Natural Resources Conservation Service, 2016):

- Remove debris from stream channels, road culverts, and bridges
- Reshape and protect eroded banks
- Correct damaged drainage facilities
- Establish cover on critically eroding lands
- Repair levees and structures
- Repair conservation practices.

Presidential Executive Orders 11988 and 13690
